"The Humboldt County farm bureau being the first in the state has embarked upon several pioneer activities, one of which is the employment of a purchasing agent to buy certain kinds of materials as direct agent for the members of the bureau. While the office of the state leader and the farm adviser are not advocating such an arrangement they have, nevertheless, given this particular movement all the assistance possible, regarding it in the light of an experiment upon which it is desirable that results shall be colated. The office of the state leader, however, has insistently declared that farmers should not go into a general purchasing business of all their supplies any more than bankers should go into a general business of owning farms. In order to have a substantial community there must be not only prosperous farmers but prosperous storekeepers and bankers, which involves as an ethical necessity that the farmers should stay well within the scope of their proper sphere.

"It would seem, however, that farmers are justified in buying cooperatively and at first hand, those materials which are used in production on their farms, thus—fertilizers, seeds, feeds and the like may be a proper sphere where a cooperative farmers' movement is really looking for the best advancement of the whole community. It is certain, however, that a general storekeeping business to sell flour, sugar, stoves, shoes, etc., is not the proper sphere on which a real farmers' organization should embark.

"The farm bureau of Humboldt County, therefore, has only purchased, and is intending to purchase only, those materials that are used in actual production on the farms. The farm bureau employs a secretary and purchasing agent who is paid a salary, and, at present, a small commission on all purchases. The latter plan, however, is recognized as being unsound, and the intention is, as soon as possible, to transfer this purchasing agent entirely to a salary basis. To date the purchasing department of the Humboldt County farm bureau has purchased something over 1000 tons of alfalfa hay, which is not widely produced in Humboldt County. This has been obtained from other farm bureaus situated in the valley region of the state and distributed through the city of Eureka to such points in Humboldt County as may be desired. It has also purchased something over \$2,000 worth of feed, such as coconut meal, rolled barley, ground barley, middlings, bran, wheat, alfalfa meal, and corn. The purchasing department is also preparing to buy seeds of high grade for its members under a guaranteed test to be checked up by the government laboratory at the university.

"One of the most important activities of the farm bureau has been the quarrying of lime from its own quarry at Howe Creek, near Rio Dell. This lime is gotten out by contract and sold

at the quarry for \$3.85 a ton or \$4.95 f. o. b. at the railroad station. The specifications for this ground limestone are that 10 per cent should go through a 200 mesh screen, 50 per cent through a 150 mesh screen, and all through a 50 mesh screen. While this quarry has only been operating during a short time, it has already gotten out and sold to the farmers 400 tons of ground lime and it is expected that an exceedingly large business will be done when the time of year for applying the lime draws near.

"The farm bureau is gradually, through its purchasing agent, getting into a small marketing business and has for some time been marketing eggs for its members. It is also prepared to handle apples under certain standardization regulations and this will doubtless be undertaken in future.

"While the purchasing experiment of Humboldt County farm bureau has so far been generally satisfactory it has nevertheless disclosed, as was expected, certain difficulties of the situation which require tact and business ability to meet. The office of the state leader, further, is not advocating the establishment of any similar enterprises in other farm bureaus but is everywhere advising the other counties concerned to watch Humboldt's experiment until such time as more data is available."

CONFERENCE ON MARKETING AND FARM CREDITS

The National Council of Farmers' Cooperative Associations has joined

with the general committee of the National Conference on Marketing and Farm Credits in issuing a call for a third conference to be held in Chicago, November 29 to December 2. The purpose of the conference is to frame legislation for submission to congress at its coming session, intended to provide adequate banking accommodations for farmers, to stimulate the movement for standardization of farm products for purposes of distribution, and to promote the organization of agriculture along lines which will develop the business side of this fundamental industry.

SUGAR IN WORLD TRADE

Recent government reports covering the total exports from and imports into all the countries of the world during 1914 show that sugar is third in importance among the eight principal foodstuffs carried in international trade. These eight rank in value as follows:

Wheat and flour	\$774,000,000
Coffee	386,000,000
Sugar	382,000,000
Rice	278,000,000
Barley and malt	220,000,000
Corn and meal	210,000,000
Tea	143,000,000
Oats	102,000,000

Of this \$382,000,000 worth of sugar bought and sold in the world's marts during 1914, the bill of the United States for imported sugar amounted to \$118,000,000, or 30 per cent of the total carried in foreign trade. To pay this bill requires exports of 110,696,126 bushels of wheat, or 63 per cent of the whole amount exported.

ARIZONA STATE FAIR

The Arizona state fair will be held at Phoenix, November 15 to 20. During the entire week there will be racing events daily, live stock judging and agricultural displays. An attractive assortment of entertainment has been arranged for in addition to the sporting events. Harness and running races for substantial purses will bring out a number of fast horses from the best stables in the country. A 150-mile automobile race on the mile dirt track for a purse of \$5000 is to be the star feature of Saturday, the 20th. The same day will witness a 100-mile motorcycle race. This year an elaborate number of wild west events have been arranged for, some "bad" horses, well known in the West, are to be ridden in the contests. The famous bull bought by a local dairyman at the Panama-Pacific Exposition sale will be on exhibit. California says it is a shame the animal left the Golden state. San Francisco's famous dog judge will be on hand to decide the merits of the canine contestants. Nine counties of Arizona will send their teachers to attend the institute which will be held in Phoenix during the sessions of the state fair. Trap gun experts will hold a number of important contests during the fair week. An extensive carnival and show combination has been secured for entertainments night and day. Gold medal babies will be selected from the many entered in the better babies contests. There will be unending variety of prizes for all sorts of farm stock and products. The total expenditure to insure the success of the fair has been placed at \$80,000, and Arizona makes a show worth seeing.

"Every Day is Bargain Day" to the Man who Buys BUILDING MATERIAL from WHITING MEAD'S Big CATALOG! 1915 Edition is FREE to you—Saves 20% to 40%

\$50 Complete Bathroom Outfit for \$36.50

Consists of:
One Lavatory with Nickel Plated China Index Compression Basin Cocks, marked hot and cold, and Nickel Plated Adjustable P Trap and Rubber Stop.
One Heavy Cast Iron Porcelain Enamel Bath Tub, 5 ft. with 3-in. roll rim, including No. 4 1/2 Nickel Plated Fuller Bath Cock, offset supply pipes, connected waste and overflow, and slip joint nuts.
One High Tank, 6-gallon, Zinc-Lined Toilet Combination, complete with valve. Finished either in Natural or Golden Oak.
We guarantee this outfit in every respect—if you are not thoroughly satisfied with it, return it and we will refund your money.
This outfit was never before sold under \$50.00 retail, and is accompanied by our liberal money-back guarantee.
Shipping weight of outfit, complete, 500 lbs. First-class freight.

Shovels—At Wholesale Cost—Shovels

—You may go a life time before you get such an opportunity again. These shovels are in A-1 order but have been slightly smoked by means of a fire while in transit.
—Every one in perfect working condition, all styles and sizes: note the prices:
Long Handle, Round Point Shovels, per doz. \$4.85 or 50c each
Long Handle, Square Point Shovels, per doz. \$4.85 or 50c each
D Handle, Round Point Shovels, per doz. \$4.15 or 50c each
D Handle, Square Point Shovels, per doz. \$4.15 or 50c each
Long Handle Spades, per dozen \$3.75 or 40c each
D Handle Spades, per dozen \$3.75 or 40c each
Long Handle Scoops, per dozen \$3.75 or 40c each
D Handle Scoops, per dozen \$3.50 or 40c each

"Air Tight" Drum Heaters \$1.10 and \$1.25

—These splendid little heaters have never been equaled for giving quick, intense heat with a very little fuel.

—Burn wood, papers or coal with equally satisfactory results. Nothing better in a stove heater. Usually sold for much more but offered by us at \$1.10 and \$1.25.

\$15 to \$18 Front Doors \$10 Veneered Oak With Plate Glass

—A typical value from our Sash and Door Dept., finest quality veneered oak doors with plate glass panels at top. Secured by special purchases recently and not mentioned in our catalog. All standard sizes and styles. Write for further details.

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet.....	\$1.15
2-ply, double-sanded, per roll of 108 square feet.....	\$1.40
3-ply, double-sanded, per roll of 108 square feet.....	\$1.65
1-ply, "King" smooth, per roll of 108 square feet.....	\$1.25
2-ply, "King" smooth, per roll of 108 square feet.....	\$1.50
3-ply, "King" smooth, per roll of 108 square feet.....	\$1.75

ber we ship direct to you.
Send for free sample. Remember

Oregon Pine \$10 to \$15

—Good new rough Oregon Pine lumber, all sizes, at \$10 to \$15 per thousand.
—Oregon Pine lath, 4 ft., new, \$2.50 per thousand.
—Best grade Slashed Grain Oregon Pine, sanded finish, \$37.50 per thousand. This makes a beautiful interior finish.
—These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

geles, California, as Second-Class Matter.**Thursday, Oct. 28, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**THE COVER PHOTOS**A glimpse of the P. P. I. E. In-
ternational live stock show may be
had on this week's cover. One of Cali-
fornia's finest Jersey herds—that of
Guy H. Miller—furnishes gold medal
winners shown in the upper photo,
while the Ayrshire winners of J. W.
Clise, Seattle, Washington, are shown
below.**BOY FARMERS**Prize winning young farmers
are at present on their way East to
see agriculture in more than half the
states of the Union. They have been
contesting during the past year for
this prize. California farming should
be materially improved during the
coming years by this trip which should
broaden and give greater power to
every one of these young men.**PREPARING FOR GREAT YEAR**Manager G. Harold Powell of
the California Fruit Growers' Ex-
change, with Orange Sales Agent Dana
C. King and Traffic Manager A. M.
Mortensen has just returned from a
several weeks' trip to various centers
of divisions which are made of the
United States in the marketing scheme
of the exchange. The centers of these
divisions are: Northwest, Seattle;
North, Minneapolis; Central, Chicago;
Northeast, Boston; Atlantic Coast,
New York, and South, Houston. In
these six divisions there are 77
agencies.Each of the 77 agents came to the
centers to meet Messrs. Powell, King
and Mortensen, also Advertising Man-
ager T. J. Grassley and W. T. Kestner
of the Lord & Thomas Agency for the
purpose of discussing the market situa-
tion and to study methods of enlarg-
ing markets and of inducing greater
consumption of California oranges, or
at least those of the "Sunkist" make.One step to this end was of course
the making known to these agents of
the situation in California, the quality
of its fruits, the standardization or
dependability of the "Sunkist" brand,
and in addition—and the greatest fea-
ture of all this trip—the closer rela-
tionship or the making of the sales
force a more intimate part of the
greatest marketing system in the
world through creating a better esprit
de corps. "Sunkist" is to be made a
household word the United States
over.The exchange will control a greater
percentage of California citrus fruit
than any preceding year.**CHRISTMAS IS COMING**Christmas is coming and the
Cultivator has a hint. It would hardly
be the thing to suggest that our read-
ers shop early; that was worn outThe Cultivator as a Christmas pres-
ent has one strong point in this, that
it gives 52 reminders of the Christmas
thought that prompted its giving.**CHAMBER OF COMMERCE**Chambers of Commerce and
other development or boost organiza-
tions are responsible for the presence
of many of us in California. The cam-
paign of telling of the wonderful ad-
vantages of the land of sunshine and
flowers started more than a half cen-
tury ago and we're still at it and al-
ways will be. We always tell the
truth—we can hardly do more—and
still they come. Some succeed and
like us; some don't. The latter are
peevish and assert that the truth is
not in us. Such we urge to greater
effort and point to the fact that suc-
cess—and liking us—is a matter of
personality.

Other than that meager advice the

HOW SHOES ARE MADE CHEAPERFIGURING cost of the individual pair, a manufacturer can make
1000 pairs of shoes cheaper than he can ten pair.When he has but ten pairs of shoes to make he can't take
advantage of modern machinery—he can't have a very large fac-
tory; he can't employ much help and he certainly has to buy
his material in small quantities.The man who makes 1000 or 10,000 pair of shoes gets every advan-
tage. He can afford to buy the most up-to-date machinery; he can afford
to employ the most skilled artists; he must keep his factory healthy and
clean in accordance with the sanitary laws; he can buy material where
he likes and practically at his own price. In fact, when he is dealing
in such big quantities it is absolutely necessary that he do everything to
reduce the cost of production and keep up quality.It is the ambition of every manufacturer to make large quantities, but
the first principle of business is how to sell. He doesn't want the stock
unless he has the means of disposing of it, and this is just where adver-
tising comes in.Without advertising and a big public demand goods are produced in
only small quantities and really at a disadvantage. If a manufacturer
advertises and so creates a big demand he can afford to produce in large
quantities, hence, the larger the business, the better the product and the
more reasonably in price it can be placed on the market, so you see there
is every reason why the article which is most extensively advertised is
most extensively produced and under the most favorable conditions for
both the producer and the purchaser.Advertising may, therefore, be considered as the wind that fills
the sails of the ship of commerce, which enables her to bring reliable
merchandise to your home cheaper than it could be brought through
any other means.some years ago. But we may suggest
that all shop with more discretion,
and that certainly cannot be done on
the day before Christmas when a man
is liable to go into the crowded shops
and with hands in pockets and mouth
open order anything from a woolly
dog to a tin whistle for some staid
grandmother.Here is the hint: Look over the list
of books and magazines which the
Cultivator offers. Our clubbing list
offers almost everything in the line of
magazines and papers. The reviews
of books in our columns during the
past year have mentioned many most
valuable publications. These have
not entirely replaced, but are to a de-
gree at least improvements on, books
previously issued. They have touched
nearly every phase of orcharding, gar-
dening, animal industry and general
agriculture. The farmer and fruit
grower finds the practices of his call-
ing improving every day. If he is up-
to-date he has used institutes and con-
ventions to the limit. But better than
all is a good book or a good paper in
the quiet of the evening. The long
evenings following Christmas day will
give opportunity for the enjoyment of
just such a present. Good reading
matter is always fitting; it is not ex-
pensive; and its value lasts for many
a day. As many books have to be
ordered from Eastern publishers, send
orders soon for delivery at any spec-
ified date. With it will go a "Merry
Christmas" or presentation card with
name of the one sending the remem-
brance.settler up against strange problems in
a strange land has had little help from
promotion organizations. There has
gradually come a change and we are
now asking what can we do to advance
the prosperity of those of us now in
the field.The California Development Board
is calling for a great conference of
producers and business men to be held
in San Diego next month to discuss
marketing problems. This combina-
tion should result in something tangi-
ble and workable or at least an in-
spiration to effort which will ultimate-
ly lead to the workable.Another movement in Riverside
County has our entire approval. It is
a County Chamber of Commerce with
representatives or delegates from local
Chambers of Commerce in all sections
of the county. Farmers and bankers,
fruit growers and merchants, garden-
ers and professional men meet and
discuss advancement of the people by
the people and for the people at
home. We recently attended the
monthly session held at Indio and at
Thermal on the Colorado "Desert." By
desert we mean a place where they
grow a thousand crates of onions per
acre, fig trees bigger than a house in
two or three years and dates the like
of which the Arab or the Algerian
never tasted.But pardon us if we defer telling
of this meeting and of the productions
of the land till another issue. The
engraver was unable to reproduce
some of our photos in time.**Agricultural Notes**The Hawaiian Sugar Planters' As-
sociation has just closed its annual
convention in Honolulu.The Austria-Hungarian government
has issued a decree prohibiting the ex-
port of sugar beet seed from the em-
pire.The German government has issued
notice to all sugar refineries that they
are not permitted to sell any of their
residue to alcohol manufacturers.It is estimated that the potato crop
of Ontario, Canada, will be 25 to 40
per cent short because of rot caused
by continued wet weather during the
summer.Large quantities of American
canned tomatoes and puree are finding
a market in Leeds, England, because
of difficulty in obtaining such supplies
usually secured from Italy.The government of Guatemala ex-
tended an invitation to American
manufacturers and exporters to send
exhibits to the National Exposition of
Guatemala and Fiesta of Minerva, be-
ginning October 31.According to the International In-
stitute of Agriculture at Rome, the
production for the year 1914 (ending
February, 1915) was 3,914,048,000
bushels, as against a production in
1913, of 4,241,528,000 bushels, that is
92 per cent of the previous year.A test is to be made in the United
States of various raw materials from
the Hawaiian Islands, including kiawe
beans for their alcohol-producing
qualities and kukui nuts for oil, also
honey and wax and tamarinds, with a
view to ascertaining to what extent
they may be developed into products
of commercial value.Sugar and chocolate, because of
their strength giving properties, are
being supplied as a part of the daily
rations of soldiers fighting in the
trenches in various parts of Europe.
It has been found that a liberal allow-
ance of sugar greatly increases a sol-
dier's ability to resist fatigue and
cold, while it also gives him added
strength for muscular work.The estimated number of stock hogs
in the United States on September 1
was about 7.2 per cent more than on
the corresponding date last year, ac-
cording to reports made to the bureau
of crop estimates, United States de-
partment of agriculture. Figures
given earlier in the year showed that
on January 1, 1915, the total number
of swine on farms in the United States
was 64,618,000, valued at \$637,479,000.There are six mills in Hankow and
Hanyang, China, engaged in extracting
oil from soy beans, the capacity of
these mills being about 8,000,000
pounds per annum. This oil is used
in China principally for cooking pur-
poses, while in Europe and America it
is used in the mixture of paints, as it
has a semidrying quality. Hence its
exportation depends largely on the
price of linseed oil, its chief com-
petitor.Specialists of the United States de-
partment of agriculture have pro-
duced a new and simple device for
sampling grain, seeds, and other ma-
terial. Its purpose is to secure a re-
liable sample from a larger portion
of the material to be examined than
would be possible otherwise. The
principle is the distribution, by grav-
ity, of the material to be sampled
over a cone which is provided with
separate ducts in a way to insure
thorough mixture of the grain.

Agricultural News Notes

of the Pacific Coast

Northern California

The university farm school at Davis has an increase of 15 per cent in its attendance.

The almond crop of the Capay Valley in Yolo County is this year estimated at about 625 tons.

Thirty-nine tons of pork on the hoof were shipped out of Orland, Glenn County, one day last week.

A fine display of almonds was sent by Orland, Glenn County, growers to the Riverside County fair recently held at Riverside.

Many shipments of California canned fruits are forced to go around the Horn now because of the filling up of the Panama Canal.

The California Creamery Operators' Association will meet at San Francisco on the exposition grounds for three days, beginning October 28.

Two hundred and eighty-four carloads of deciduous fruits were received in the New York market from California the first week in October.

The California Ripe Olive Association announces a meeting of its executive committee on Friday, October 29, at its San Francisco headquarters.

The Sonoma County Grape Protective Association has decided to join the California Viticultural Association in combating the tax on wines and brandies.

Members of the Poultry Federation at Penn Grove, Sonoma County, gathered at the ranch of H. M. Bailey and helped him to rebuild a brooder house which was destroyed by fire.

Twelve thousand five hundred acres of rice were this year planted in the Richvale, Biggs and Gridley sections of Butte County. Most of this acreage is planted to the Waterbune variety.

A three days' apple school is to be held at Sebastopol during the first week of December by the Sebastopol Agricultural Club under the supervision of the state agricultural college.

Marysville is in gala attire this week. The festivities last until Saturday night, October 30, when a Mardi Gras ball will be held on the streets of the city to close the week's rice carnival.

The Sebastopol Agricultural Club at its last meeting elected the following officers: Charles King, president; Mrs. Hilda B. Nielsen, vice president; Mrs. A. Fiala, secretary; Mrs. M. King, recording secretary and treasurer.

The Glenn County farm bureau has elected the following officers for the coming year: D. C. Cowan, president; S. C. Davis, vice president; G. W. Troxel, Larkin; W. W. Foster, Corda; S. S. Havenor, Jacinto, and A. E. Linstrom, Orland, delegates at large.

The California Draft Horse Breeders' Association elected the following officers at its annual meeting in San Francisco: President, Henry Wheatley, Napa (re-elected); vice president, Al A. Smith, San Francisco; secretary-treasurer, E. W. Westgate, Rio Vista; directors, Professor True, University Farm, Davis; Professor Jenkins, Stanford university; T. McCormick, Rio Vista.

Central California

The rural credits commission held hearings at Fresno, October 20-21.

Hanford growers have subscribed about \$4500 to the Peach Growers' Company.

The Peach Growers' Company held a meeting at the Wolter's Colony on Friday, October 22.

The Oakdale branch of the Almond Growers' Exchange sent out a shipment of 57,000 pounds of almonds last week.

The Stanislaus Poultry Association has issued its premium lists for its show, to be held in Modesto, December 1-3.

The first prize in the potato growing contest of the Kern County high school was awarded to Leslie Haupt of Bakersfield.

Peach growers of the Manning school district of Fresno County have subscribed over \$1500 to the Peach Growers' Company.

The Orchardists' Committee of the Watsonville Apple Distributors is discussing the advisability of securing a farm adviser for Santa Cruz County.

Two thousand acres of Kings County lands will be planted to fruit trees this fall. Peaches, olives and apricots will be most generally planted.

The Porterville Citrus Association has arranged to cooperate with local employment bureaus in securing help in the community so far as possible.

Charles Boyd of the Dakota Colony is the prize winner in the potato growing contest carried on by the agricultural department of the Kerman union high school.

President Giffen of the Associated Raisin Company has announced that the raisin company will take no part in the organization of the Wine Growers' Protective Association.

The directors of the Stanislaus County farm bureau held a meeting in Modesto Saturday, October 23, to discuss methods of increasing interest and membership in the locals.

The Merced County Swine Breeders' Association held its semi-annual meeting at Gustine Saturday, October 16. C. R. Schaffer of Atwater is president of the association and A. W. Morley of Plainsburg, secretary.

Manager Madison of the Associated Raisin Company has issued a letter to raisin growers asking them not to rush their raisins to local packing houses but to extend deliveries as far as possible to avoid congestion.

The Associated Raisin Company is having considerable difficulty in handling raisins offered by growers because of shortage of cars, embarrassing the association not only in shipping out raisins but in slow receipt of box shock.

A portion of the canal that converts the water from the Kings River into the canal of the Alta irrigation district was destroyed last week. It is charged that this was the work of farmers who were served by canals lower down on the river which have been deprived of water by the diversion into the Alta canal.

Southern California

The Puente Walnut Growers' Association has already shipped out 15 carloads of walnuts.

Thirteen thousand six hundred and twenty-five acres of the old Chino ranch is in alfalfa.

A sharp advance is reported in the lima bean market during the past week. Many sales are reported at \$4.50 and \$4.55.

The Los Angeles County supervisors are being urged to place a bounty of \$30 on mountain lions. The state now offers a bounty of \$20.

The California Ahuacate Growers' Association held a most enthusiastic meeting in Los Angeles on Saturday. Over 300 were present.

Joseph Moore, of Saticoy, hauled in two truck loads of walnuts, 19 tons, from Saticoy to Carpinteria, a distance of 30 miles, in ten hours with a Yuba tractor.

Mrs. Anita Baldwin made large purchases of pure bred Holsteins at the Sacramento Holstein sale and has installed them on her ranch in Los Angeles County.

The seven counties joining in the Southern California exhibits at the Panama-Pacific have installed a fine moving picture theatre in the center of the California building.

The San Dimas Fruit Exchange has marketed 648,246 boxes of fruit this season. The management reports the average on Valencias for the year 60 cents above receipts for the previous year.

The Riverside County chamber of commerce visited the Coachella Valley Saturday, October 23, inspecting date growing sections and winding up with a quail dinner at Thermal in the evening.

The Chino beet sugar factory reports the biggest and fastest run ever made. The wind-up of the slicing campaign will be celebrated with a turkey barbecue. The campaign ended October 15.

Fifty-three thousand acres of land was recently added to the Imperial irrigation district by action of the board of directors and property owners who were desirous of having their land included in the district.

The Southside Improvement Association of Chino has decided to erect a canning factory to take care of peaches and apricots. This cannery is proposed to be one of a chain of three, the others to be established at Hemet and Pomona.

Forest fires which started in the oil derrick section of Ventura County swept over thousands of acres of fine bee pasture lands and caused great damage. Beekeepers estimate that it will be from five to ten years before these ranges will fully recover.

Stanley La Sha, a high school boy of El Cajon, California, has been declared the winner of the grand prize offered by the University of California to members of the Boys' Agricultural Club of San Diego County. The prize consists of a transcontinental trip to Washington, D. C.

The Coast

Willcox, Arizona, has a new creamery.

An Eastern paper predicts 50-cent wool by January 1.

Two carloads of Duroc hogs have been received in Yuma from Kansas.

The Farmers' Improvement Association of Mountain View, Arizona, met on October 27.

Thousands of head of sheep are being shipped daily from points on the Oregon Short Line in Montana.

January 3-8 is farmers' and home-makers' week at the New Mexico college of agriculture at State College.

Stockmen of Apache County, Arizona, have just secured a bunch of 30 pure bred Hereford bulls in Denver.

The Farmers' Association at Quincy, Washington, has erected a steel elevator with a capacity of 40,000 bushels.

The Utah Fruit Growers' Association has issued a bulletin of instructions in methods of picking and packing apples.

Whitman County's 20th annual fair, recently held at Colfax, Washington, had a new feature this year in the large poultry department.

The Yuma project in Arizona is being inspected by Dr. Elwood Mead, who is at the head of the irrigation department of the state university.

The live stock department of the Santa Fe railroad estimates that the fall shipments of cattle from the Seligman country, Arizona, will run about 20,000 head.

As the result of experiments on the Yuma reclamation project in Arizona the United States department of agriculture has determined alfalfa to be the best green manure crop yet found for that section.

The farmers' short courses to be given by the University of Arizona college of agriculture at Tucson will be held from January 3 to 15. The university has a new agriculture building which will be devoted to the uses of the farmers.

A band of 30 Mexican mountain sheep, believed to be the sole survivors of large bands of these animals that were once common throughout the Southwest, are being protected by forest rangers on one of the national forests in Arizona.

The advisory committee of the Arizona Cattle Growers' Association met with forestry officials in Phoenix the first of the month to discuss legislation for regulating number of herd bulls, limiting number of cattle allowed to each permittee, extermination of predatory animals and other matters of vital interest to stockmen.

Complying with numerous requests from the growers' councils, chambers of commerce, growers' and shippers' organizations in the states of Washington, Oregon, Idaho and Montana, the office of markets and rural organization of the United States department of agriculture has made plans to establish temporary headquarters in the Northwest for the study of the distribution of the 1915 box apple crop.

Making a Silo Pay

is an easy matter if you have the right kind.

THE UNIVERS-ITY FARM at Davis, Calif., last year bought an

Ideal Green Feed Silo

and tried it out in actual use beside others, including a home-made one they built.

THEY RECENTLY PURCHASED ANOTHER Ideal Green Feed Silo, which is the best evidence needed of their judgment of its quality and efficiency.

THESE TWO IDEAL GREEN FEED SILOS are used to help make a profit in their farm operations and were purchased out of their farm income.

THE MEN IN CHARGE ARE BUSINESS MEN and know a good thing when they see it.

WHY NOT PROFIT BY THEIR EXPERIENCE and order your Ideal Green Feed Silo now?

PLANS FOR A SWINE BREEDERS' ORGANIZATION

Written for the California Cultivator
By Sacramento Valley Contributor

PLAN is being discussed that has for its object some definite action along the line of hog cholera control in Colusa, Yolo and Glenn Counties.

There is a very active Swine Breeders' Association in Colusa County, with G. W. Roeber of Delevan its energetic and enthusiastic president, and State Veterinarian Chas. Keane has been working with this organization for some time.

Much good has been accomplished, but now it is being suggested that in order to bring about the greatest possible benefit to the industry in this section there should be some one in the employ of the counties and the state who shall have police power, be able to make and enforce quarantines as necessary, and whose entire time shall be devoted to looking after the swine interests in these three counties. This man should be a thoroughly qualified veterinarian who has had special training and experience with hogs.

It is thought that one man with an automobile can cover three counties satisfactorily and look after all outbreaks of disease. It is proposed that he treat all hogs free of charge for service—the owners of the animals to furnish the serum and virus. The cost of serum and virus has been reduced from two cents to one cent per cubic centimeter, so that with the arrangement suggested the work can be done at moderate cost. For instance the maximum dose generally given a mature animal is 90 cubic centimeters of serum, which costs \$1.80 plus the veterinarian's fee under old conditions. If this can be cut in two and the veterinarian's fee eliminated, it will make a great change in the situation.

It would be the business of this swine officer to see that dead hogs are not thrown in irrigation ditches or streams, and if it is done that the offender is punished so that the offense may not be repeated.

He would encourage the killing of buzzards and pigeons in the vicinity of infected premises and the destruction of stray dogs.

The farms where cholera is present would be effectively quarantined so that inquisitive friends or neighbors would not carry the disease to clean herds.

This is certainly a move in the right direction and should be given hearty support.

PRODUCTIVE SWINE HUSBANDRY

"Productive Swine Husbandry," by George E. Day, B.S.A., professor of animal husbandry, Ontario agricultural college, Canada, published by J. B. Lippincott Company, Philadelphia, at \$1.50 net. This is a magnificent book of 354 pages with complete index on heavy paper, with many illustrations and more of line engraving text figures.

"No effort has been made to avoid the practical sides of the subject in order that a certain type of schools might prefer the book. On the other hand the practical sides have been

placed foremost with the belief that all students as well as breeders should prefer to think of the subject in a practical way. An effort has been made, however, to treat the matter concisely and logically and arrange the topics in order. The chapters have been grouped into seven parts to make them more easily referred to by both students and breeders."

There are 35 chapters in the book, touching upon the place of the hog on the farm, types of swine, these two chapters comprising Part I. Part II touches upon breeding and selection; part III various breeds of swine, a chapter being given to each one of the breeds. Part IV, with seven chapters, touches upon results of experiments in swine feeding. This is one of the most interesting chapters for the practical swine breeder. Part V consists of five chapters and takes up management and feeding questions. Part VI with two chapters, marketing and curing. Part VII, four chapters, discusses fully buildings, sanitation, common diseases of swine, composition of feeding stuffs, swine literature, and one of the best features is a comprehensive index.

Of course there are tables giving composition of feeding stuffs. At the end of each chapter there is a series of review questions, these for the use of the student, also for the casual reader, for there is no better way of impressing the contents of a chapter upon the mind than to run over a series of a dozen or more questions upon the contents of that chapter. For instance, at the end of Chapter XXVII, which touches upon the care of young pigs, the questions asked are:

"Give a plan of keeping new-born pigs warm in very cold weather.

"Tell of the importance of the first milk soon after farrowing.

"Tell of the management of apparently lifeless pigs when first born.

"Give plans for teaching sucklings to eat.

"How may young pigs be induced to exercise?

"When is the best time to wean pigs? Give reasons for variation.

"Give suggestions regarding best feeds after weaning. Why avoid giving corn only?

"What is the cost given for pigs six weeks old? How is it calculated?

"What variation in these figures would be necessary for the present prices of feed?"

This book is an excellent one for the swine breeder.

SCABIES QUARANTINE MODIFIED

More than half of the territory now under quarantine in California for sheep scabies will be released on October 15. This order frees 43,243 square miles, leaving 41,710 square miles still under quarantine in California. Including the states of Colorado and Texas there will be when the new order goes into effect only 324,827 square miles still under quarantine for this disease. Originally, there were 1,784,596 square miles quarantined. The work of eradicating scabies in the three states named is being carried on by cooperation between the United States department

A LIVE STOCK "WAVE"

Written for the California Cultivator
By Special Live Stock Contributor

A part of the great "back to the land" movement that is sweeping over the country now is a desire on the part of many people in all walks of life to own live stock. Go into any small or medium sized town and you will find live stock topics being freely discussed and a good many going into the business in one way or another. And the live stock population of the farms of the state is rapidly and constantly increasing.

There are lawyers and store keepers and doctors and barbers and bankers who are getting small places close in where they can keep a few pigs, a half dozen cows or a little flock of sheep or chickens. Some of these do not get much but occupation and some pleasure, with an opportunity to pay feed bills, but there are others who build up profitable enterprises that eventually take all of their time and provide healthful and remunerative occupation.

There are not many healthy, normal persons who do not have an inborn love for live animals and derive a great deal of pleasure and satisfaction from associating with and caring for them. This is not always so strongly manifested as with the man who said "the more I see of people, the better I like hogs," but there are a great many people who would rather associate with good hogs or sheep or cattle or horses or poultry than with some folks.

Aside from sentimental or partly sentimental reasons for raising live stock—because the grower likes to be "around" and "with" the animals, there is a sound economic reason for growing them. There is an increasing demand for meat and milk and other live stock products. There will unquestionably continue to be high and low "spots" in the markets, due to periods when the marketable supply is small or large, but those best in position to know of the world's prospective needs and supply predict a constantly increasing demand at prices that cannot be permanently low. So the future of the live stock business seems bright, not only for the farmer grower but for the amateur who becomes a professional, and the beginner who eventually gives it up at a financial loss may cheerfully charge his experience to "recreation" or "sport"—for he will doubtless get as much of pleasure and satisfaction from the care of animals as from many other pastimes.

THE SOW'S FEED

Great care must be taken to feed the sow properly. If she is not being properly fed the little pigs will show it. If the pigs follow the sow around very much and pull at her teats, it is an indication that she is not giving enough milk, and more feed should be given to stimulate milk flow. When a sow is overfed, causing a heavy milk flow, scouring is generally produced in the pigs. If this happens, cut down the sow's feed immediately. Give the sow 15 to 20 grains of sulphate of iron (copperas) in her slop morning and evening, and if necessary increase the dose until results have been obtained.

EXPORTS OF CHEESE, BUTTER AND BUTTER FATS

Cheese, butter, and other butter fats are again becoming important factors in our export trade after a long period of comparative inactivity. Fifteen or 20 years ago the United States was selling abroad between 20,000,000 and 30,000,000 pounds of butter, from 50,000,000 to 80,000,000 pounds of cheese, and from 5,000,000 to 10,000,000 pounds of imitation butter annually. In later years, however, exports of this class decreased in a marked degree and in the fiscal year 1914 had fallen far below the quantities named. In the year just ended there was a distinct revival in all these lines, with totals closely approximating the high levels touched in the decade from 1890 to 1900.

The large gains made by domestic dairy products and butter substitutes are well illustrated by figures published by the bureau of foreign and domestic commerce. Butter, usually averaging about 3,500,000 pounds annually in our export trade, in 1915 went to nearly 10,000,000 pounds. During this period imports of butter were reduced by more than one-half, falling from a little less than 8,000,000 pounds in 1914 to less than 4,000,000 pounds last year.

American cheese, running at about 2,500,000 pounds a year, went to 54,000,000 pounds in the fiscal year 1915. Here also, as in the case of butter, the trade balance was transferred to the export side, for the year's imports of cheese last year only totaled 50,000,000 pounds, a decrease of 13,750,000 pounds from the total for 1914.

Exports of condensed milk, usually exported in sums valued at between \$1,000,000 and \$2,000,000 annually, in 1915 rose to \$3,000,000 in value, the quantity (37,000,000 pounds) being double that of 1914.

Imitation butter contains in addition to oleomargarine oil some butter fat. The exports of this article also doubled, rising from 2,500,000 pounds in 1914 to 5,250,000 pounds last year.

England has become our largest foreign market for butter, cheese and condensed milk, having taken 3,333,333 pounds of butter, out of a total export of 10,000,000 pounds; 48,500,000 pounds of cheese, out of a total export of 54,000,000 pounds; and 4,000,000 pounds of condensed milk, out of a total export of 37,000,000 pounds. Canada, Cuba, Panama, Australia and Venezuela also take considerable quantities of American butter; Panama and the West Indies are important markets for our cheese; while Cuba, Belgium, the Netherlands, China, Japan, Hongkong, Russia, Chosen, Panama and Brazil take large amounts of American condensed milk.

These exports, while important, represent a very small proportion of the annual products of the 60,000,000 cattle on American farms, valued at more than 2,333,333,000. As long ago as 1909 the latest period covered by the national census, we produced 1,619,000,000 pounds of butter, 321,000,000 pounds of cheese, and 5,814,000,000 gallons of milk, while the quantity of oleomargarine on which internal revenue tax was paid in 1914 aggregated 142,000,000 pounds.

By the light of the farm adviser's Ford the Farm Improvement Association of Lehi, Arizona, met in front of the meeting house which was pre-empted by the singing school.

Jane Korndyke of Riverside of the Morris herd topped the sale for cow prices, bringing \$1550 after spirited bidding.

Dairymen Attention! Stockmen

Don't fail while you are at the Exposition to look into the Silo question. Of course, there is no longer any question but that every feeder of stock, either dairy or beef, needs a silo. The question is Which Silo? If you will carefully investigate the

Remco Redwood Stave Silos

near the dairy barns, compare them with all other makes and note their many advantages you will surely be convinced this is the silo for you. We build them in all sizes and dimensions exactly as you want them for your particular needs.

Remco Redwood Tanks in All Sizes

Redwood Stave Pipe

in diameters from two inches to twelve feet. See our exhibit of pipe and tanks in Machinery Hall.

All our silos, tanks and pipe are designed by our engineers to meet every condition. Made in our big factory from Clear Air-Dried Redwood; selected from stock of 40,000,000 feet which we carry at all times, and sold direct to you.

CATTLE SHOW WINNERS

Continued from Page 411

many Brown Swiss cattle on the Pacific Coast and the interest in the breed is increasing. Their strength and hardiness combined with good milking ability commend them to many localities.

The Ayrshires

As was noted last week there was a remarkable show of Ayrshire cattle.

The Ayrshire is a wonderful dairy animal and any critical observer is impressed with the extreme to which the point of dairy excellence has been carried.

The head of a typical cow is clean cut and refined, denoting intelligence and dairy temperament; there is no beefiness nor coarseness about the neck and throat, the withers are sharp and neat as is required in ideal dairy form. There is ample chest and heart room, the back is straight and sharp, the middle of ample capacity, the rump and hind quarters beautifully square and even but without beefiness. There is ample room for the square, symmetrical udder that extends well forward and back is as perfectly formed as though it were made to order. There is ample and tortuous veining and the clean cut legs of good quality are set squarely under the four corners of the body. In short she is a model of dairy perfection. And the heifers and heifer calves are "regular little cows."

The spectacular show presented made many friends for the breed. There was an abundance of quality in the individuals and they were assembled in sufficient numbers to make a very impressive exhibit.

J. W. Clise, Seattle, Washington, had more first prize winners than any other exhibitor, although the competition was very keen and superior animals were shown from the herds of E. B. McFarland, Steybrae Farm, San Mateo; W. J. Domes, McCoy, Oregon, and the Oregon and California agricultural colleges.

The Ayrshire Breeders' Association had an attractive booth from which valuable information concerning the breed was distributed.

Holstein-Friesians

There was a royal battle in the Holstein classes; a wonderful lot of cattle, beautifully fitted and well brought out, contested for the honors.

There was the keenest of interest in the judging of the black and whites from the time the aged bulls were led in the ring until the last of the group prizes were awarded.

There were very few common or inferior individuals in the entire show, and it was no easy matter to make the selections. Judge W. H. Standish of Lyons, Ohio, performed his task carefully and well.

Honors were well divided. John L. Smith of Spokane, Washington, has a wonderful herd of cattle and is one of the great constructive cattle breeders of America. He breeds the cattle that win for him and no one knows better how to fit and show than he. His great bull, Hazelwood Ormsby Posch, was first prize aged bull and grand champion of the show, and he had winners all down the line.

Wm. Bishop of Chimacum, Washington, had a big herd on exhibit and won grand championship on the aged cow, Bonnie Ormsby Lass, a cow of wonderful capacity with a big symmetrical udder of excellent quality and having wonderful refinement of head and neck and an exceptionally mellow hide. He had many other winners.

R. R. Cartwright of Angels Camp had a popular prize winner in the beautiful cow that is illustrated and won many other prizes. His cattle were not as highly fitted as were those of the F. H. Porter herd from Halsey, Oregon, who had many at the head of the list.

The Carnation Stock Farm, Seattle, Washington, made a showing that was

a credit to the breed and was prominent among the winners throughout all of the classes. This enterprising concern has maintained an exhibit of superior cattle that has been one of the big attractions of the fair and it has been of inestimable value to the Holstein-Friesian industry.

A number of good cattle were shown by Laura J. Frakes and Brother of Sutter Creek and by the California and Oregon agricultural colleges.

The Guernseys

The strength of the Guernsey breed on the Pacific Coast was reflected in this show, which was a truly international affair when the quality of the contestants is considered. Had it been possible for the Eastern herds to have been exhibited it would have been the greatest Guernsey aggregation ever brought together, both for numbers and quality.

W. H. Dupee of Santee has a herd that ranks with the best in the world, and the animals exhibited were brought out in the pink of condition. Both grand championships went to this herd, and many other prizes throughout all of the classes. Mr. Dupee has maintained a view herd at his own expense at the exposition in the interests of the breed for some time.

W. H. Saylor of San Francisco won many ribbons on representatives from his famous herd of heavy milking, high testing animals. His cattle had not been fitted for the show as had some other entries, but they are splendid representatives of profitable dairy animals.

A. B. Humphrey of Mayhews was another prominent winner. His cattle are bred for their ability to produce profitably in the dairy and they are splendid individuals.

A. L. Gile of Chinook, Washington, won many important prizes on cattle that are royally bred, good producers and shown in fine condition.

D. H. Looney of Jefferson, Oregon, has another topnotch herd that was well up in the prize list.

Mrs. Annie S. Lathrop, Stanford university, was creditably represented

by individuals from that old established herd.

Secretary W. H. Caldwell of the Guernsey Association was in attendance and a fine meeting and banquet was held. Much valuable advertising matter concerning the breed was distributed.

Jerseys

California herds made a very creditable showing in the Jersey classes.

By many the most important class in the show was considered to be that for five cows in milk. This was won by Guy H. Miller of Modesto who showed 11 head and won 12 prizes.

The N. H. Locke Company of Lockeford, showed 19 head and won 21 prizes, and all of these cattle were bred by the exhibitor. Practically all of them are descendants in the first or second generation of the great bull King's Valet.

B. D. McGehee of Modesto had a prizewinning two-year-old bull.

Another herd of great dairy excellence, but not in high show condition, was that of S. P. Kelly, Ferndale, and the herd of S. F. Williams of Chico, was the subject of much favorable comment. Mr. Williams has been a prominent winner at California fairs.

The herds from Oregon and Washington won the bulk of the prizes in the breeding classes, including both grand championships. The owners of these herds showed a wonderful lot of beautifully finished cattle of great quality. They are by H. West, Scappoose, Oregon; C. P. Hembree, Monmouth, Oregon; F. E. Lynn, Perrydale, Oregon; E. L. Brewer, Satsop, Washington, and Guy C. Chapman, Pomona, Washington.

The American Jersey Cattle Club booth and representation was a clearing house for information concerning the breed and a popular meeting place for breeders and dairy men.

This International Show has been of greater value to the live stock industry of the Pacific Coast than it is possible to estimate at this time. The benefits from it will be continuous and far reaching.

Willowmoor Ayrshires

Winners of all Championship and Higher Awards at Panama Pacific Exposition

The Ayrshire in official and competitive tests has proved herself to be a most economical producer of milk and butter, yielding the largest possible amount for the food consumed, and at the least possible cost.

The Ayrshire is the Dairy Rustler, thriving and paying a profit on the least natural food supply, because she is a vigorous feeder, not at all dainty in her appetite, eating with a relish everything that comes in her way in the line of forage; good grass, poor grass or browse, all is food for the Ayrshire cow.

While the Ayrshire is strictly a dairy cow, she fattens so quickly when dry, and is so heavy in hind quarters and loin that she is a favorite with butchers.

This herd of three hundred head of registered Ayrshires holds first place as producers in the show ring.

Peter Pan, one of our herd bulls, was Grand Champion at the Royal Agricultural Show, Great Britain, before imported, at the National Dairy Show, Chicago, and at the Panama-Pacific Exposition, and wherever shown on the Pacific Coast. Production records of his daughters place him at the head of producing Ayrshire bulls.

Stock sold on production records of dams; all tests 365 days.

Of eight world's records made by all Ayrshire breeders in America since 1900, this herd has made three.

Catalogue and prices upon application.

INCUBATOR CHICKS OR CHICKS HATCHED BY HENS, WHICH?

Written for California Cultivator
By Jos. E. Blackshaw

In the Cultivator under date of September 9, 1915, appeared an article denouncing incubator chickens as breeders.

In reading the article there came to my mind a time in a large Eastern manufacturing plant when an innovation was made whereby instead of 100 to 150 articles being turned out per day, there were made from 700 to 750 of similar articles, and more perfect than formerly, per day. The man who used to make 100 to 150 per day, coming in, was asked "What do you think of that?" As he turned and almost ran away he said "It can't be done!"—in spite of the fact that it was being done.

Now I will admit that many persons are unable to turn out good chicks from an incubator; also there are many blacksmiths and carpenters who cannot turn out good work, but none the less there are quite a number of good blacksmiths and good carpenters, although there are comparatively few good ones. It is so in educational work; of all our school teachers how few really excel! But must we blame our normal schools and say they are a failure because many who graduate are poor teachers? They had the same textbooks, the same teachers; why then were not all the graduates equally good? And so it is with the incubation and raising of chickens!

Give 100 eggs from the same flock, laid on the same day, to each of five men, and some of them will hatch hardly any; others will hatch a large percentage of all the eggs, even though the machines are of the same make and run in equally good cellars! Why?

Then again some of them will hatch a nice looking bunch and in five or six weeks have few (if any) left; and any still living will be miserable, scrawny specimens. Some will have 95 per cent of all hatched at the end of five or six weeks still bright and happy. Why? Simply because the human factor comes in; there is that much difference between individuals, and for that reason alone there will always be good room for the man or woman who can properly run an incubator, run it so as to turn out strong, healthy, livable chicks.

Now this is not all a built-up theory of what should be, but is drawn from many years' incubating and raising.

Thirty-five years ago the writer made his first incubator, and from 60 eggs put in incubator hatched 42 fine chicks and raised all but one to maturity by artificial methods; they never heard the cluck of a mother.

Last spring I built (so far) my last incubator. In it I put 1243 eggs and from these eggs I hatched 1055 chickens! The eggs were laid by hens who for several generations had been hatched and brooded artificially. I sold several hundred to different parties, all of which were reported as doing fine; further, my incubator hatches this year averaged over 80 per cent of all eggs put in incubators, and all these eggs were from the same hens,

and I have today in my own yards about 600 pullets from ten weeks to seven months of age that are the equal of any chickens for vigor.

I believe that I can beat the old hens any year in raising a certain number of good pullets from 1000 eggs.

Of course I know too many day-old chicks are sold that under any system of raising could not make healthy, vigorous hens, even though their parents had been all that could be desired; because some day, some night or some hour, something had gone a little wrong with incubation.

It takes grit to cull out fowls properly. One of my positive rules is "not to breed from male or female who has in any way been sick," even though it were only a slight cold. There, I believe, is one great point!

WATER FOR POULTRY

One of the most important things in summer is to have plenty of fresh water for the fowls. The water vessels should be refilled twice a day and should be thoroughly rinsed out each time. It will not do to fill them by merely adding more water. Particularly is this the case if the water is not well protected, for then it becomes a constant menace to the health of the flock.

Anyone who has seen a number of fowls gather about a fresh supply of water on a hot day and noticed with what eagerness they drink, will realize how much the freshness of the water is appreciated.

It is true fowls will drink out of a mud puddle at times, but perhaps this is done for a change, at any rate it does not prove that stale water will answer the purpose as well as fresh.

It is of course more advantageous to have running water through the yard or yards but where this is not possible it should be seen to that the water supply is kept fresh. On one farm that came to the attention of the writer the poultry yards ended at a clear running brook, thus making an ideal watering place for the fowls.

In getting new poultry or making a change in the drinking vessels it is well to keep watch of the fowls for a short time. It has been the experience of the writer that poultry accustomed to certain styles of drinking fountains may not take to the new ones at once if these are of different design. This is more apt to be the case with fowls that have been used to getting the water from open drinking vessels as they seem to have difficulty in bringing themselves to drink from fountains where the water is confined.

It would seem that where water vessels are given the requisite amount of attention that the open drinking vessels if not too shallow and properly placed and protected, are preferable to those fountains where the water is confined except for the small space from which the fowls obtain the water.—Farmers Guide.

The Reedley chamber of commerce has decided to hold a fall festival some time in December.

DROOPY WINGED CHICKENS

While a few beginners, observing the long wings of their Leghorn chicks, congratulate themselves on rapid growth, a great many of the more observing beginners write to Helen Dow Whitaker of the poultry division of the state college of Washington, asking how to prevent them. In reply Mrs. Whitaker states that droopy wings and loose feathering are more frequent among the Leghorns and other lightweight breeds than among the heavier birds which seem to use food first for frame and muscles and later for feathers. In general, drooping wings show lack of assimilation of sufficient nourishment in the food to keep up with rapid feathering. The following are conditions favoring them: Overheating, crowding, impure air; but especially lack of exercise and lack of green food in a rather rich ration, which finally results in indigestion. The chick is unable to assimilate the nutriment in his food and he suffers from lack of nourishment just as surely as though he were underfed.

To avoid droopy wings, avoid the conditions that induce them. Feed a ration containing oats, first rolled oats, breakfast food form but uncooked, from the fourth week on sprouted oats; also feed cracked wheat and after the fourteenth day an equal bulk of finely cracked corn. For a mash use to every 10 pounds of bran at least one pound each of dry granulated bone and high grade beef scrap. Best of all, give chicks all the clabbered milk they will drink but do not let the milk become bitter before feeding. Keep the chicks hungry and keen for each meal, feeding little and often. Twice a day feed an abundance of finely cut, tender, juicy green food. Send every chick to bed with a comfortably full crop. Under these conditions, if the chicks are not of weak stock, few will have droopy wings.

UTILITY EXHIBIT

At a meeting of the San Francisco Poultry, Pigeon and Pet Stock Association, held in the rooms of the California Development Board in the Ferry building on Sept. 16, T. E. Quisenberry, poultry commissioner of Missouri, and superintendent of poultry at the Exposition, gave an interesting lecture illustrated by 95 lantern slides regarding the one-hundred-acre poultry experimental farm which is maintained by the state of Missouri with an appropriation of over \$81,000, supplemented by an additional \$20,000 for extension work, etc.

The chief object of the meeting, however, was the establishment of rules and regulations governing the utility division of the Panama-Pacific Exposition Poultry Show, Nov. 18 to 28. It was decided to call upon all poultry keepers for suggestions in regard to the methods of handling this new feature of poultry shows. The American Poultry Association is preparing a utility standard which will no doubt be adopted at the convention to be held at the time of this show, but any rules or plans established at that time cannot be applied to this show. Poultry keepers everywhere who breed poultry for utility or market purposes are urgently requested to send their suggestions to T. E. Quisenberry, superintendent of poultry, Panama-Pacific Exposition, San Francisco, at once.

ELIMINATION OF BACILLARY WHITE DIARRHEA

The Extension Service and the experiment station of the Massachusetts agricultural college will cooperatively undertake a campaign to rid the flocks of Massachusetts of bacillary white diarrhoea among chicks—a disease which yearly causes thousands of dollars of loss to poultry-keepers, and which is transmitted by infected hens in the breeding pens. These hens can be detected by a laboratory test of their blood. The college will, so far as its facilities and force of workers permit, make this test for all owners who apply for it, charging therefor in order to cover a part of the cost the sum of five cents per hen.

The blood samples will be taken by a man working under the extension service; the laboratory test will be made in the veterinary department of the experiment station.

NOW is the time to Feed Coulson's Egg Food

to your pullets as well as your hens, commencing at the age of three months. This enables them to rapidly complete their growth and get down to the business of egg laying. Write for free book "Chickens" and don't be put off with any other egg food.

Coulson Co.
Petaluma, Cal.

VEGETINE Makes Bank Balances

We can save you from ten to twenty-five per cent on your feed bills. This means the difference between success and failure in the chicken business.

We have a wonderful new poultry food that contains more protein than Bran, which sells at a price thirty-five to fifty per cent cheaper than Bran. Write for circular "Food for Thought and Feed for Chickens," which tell all about this great money saver.

Mr. Kline of Burbank, Cal., one of the most successful poultrymen of Southern California, says:

"I have been using VEGETINE for the past four months on my whole flock and as far as I am able to determine at this time I am fully convinced that it is a saving in food price. We have gotten up to and above normal egg yield during the time at an appreciably lower cost."

Mammoth White Holland Turkeys—H. McKusick, Calexico, Cal.

WANTED

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

Wanted—To hear direct from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

LIVE STOCK

Big Type Poland Chinas—I have an extra good lot of strictly high class young boars from three months to one year old that are fit to head any herd anywhere. Visitors say they are the best they have seen. They have the large size, the good hams and shoulders, the strong arched backs, great length and depth of body, plenty of smoothness, mellowness and quality—in fact, they have two good ends and a good middle, are good lookers and money makers. Their dams are either from Illinois, Iowa or Missouri, or they are from dams whose sire or dam are from these states. These boars are sired by Iowa Wonder, who will weigh over 1000 pounds in show condition. He is a son of A WONDER, the greatest Poland China boar living or dead. These young boars carry the stamp of their sire and will sire pigs that will please you. Satisfaction guaranteed in every particular. I am overstocked. I have boars galore. I will sell them at extremely low bargain prices. No females for sale at present. The book on "THE HOG SUPREME, THE POLAND CHINA" will be sent to you free for the asking.

Yours for the BIG TYPE—the kind that grow faster and larger and have more pigs. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I. C. Swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

Del Dayo Farm (Old Haggin Bottom Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

65 Head Registered Poland China Hogs for sale; all sizes, both sexes. None better anywhere. Large and medium type. \$20.00 and up. We will please you or refund your money. W. A. Young, Lodi, Cal.

Blue Ribbon Herd Duroc-Jersey Hogs, Service Boars and Bred Gilts a specialty; also boar and two sows, not related. Meet me in S. F., 1915, prices. John P. Dagg, Modesto, California.

For Sale—Jersey Bull Calf, eligible for registration. Dam and calf first prize at Orange County Fair. Price \$50.00. Fine stock. T. H. Bowen, Route 2, Santa Ana, Cal.

Milch Goats—Two ¾ Toggs, does, 2 years, both bred. One ¾ Toggs, doe, 7 mo.; one 15-16 Toggs, buck, 5 mo. H. D. Minor, Wasco, Cal.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Milch Goats—Young Nubian Swiss does from heavy milking stock. For prices, etc., write Miss E. Stocker, 587 N. Broad St., San Luis Obispo, Cal.

Poland Chinas—200 head fine individuals, weanlings to eight months. Satisfaction or money refunded. Geo. V. Beckman, Lodi, Cal.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Navato, Cal.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Calif.

Registered Thoroughbred Berkshires of all ages; Cholera Immune; large boned. Ricconi Bros., Mountain View, Cal.

Poland Chinas—Young Stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

Glennview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

W. J. Hanna, Reaoks Ranch, Gilroy. Large type Poland Chinas; bred gilts. Service boars.

For Sale—One Saanen doe, three years old, also Saanen buck four months old. Add. Mr. Fred Hansen, Carpinteria, Cal.

Berkshires—Boar pigs for sale. Butte City Ranch, Butte City, Glenn Co., California.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

SEEDS AND PLANTS

Strawberry Plants of the following varieties: Gold Dollar (extra early, fine, our leader.) New Oregon, "Morse" and the famous Ettersburgs No. 80, and No. 112, price 75c (postpaid) per 100, \$3.50 per 1000. Foreman Bros., Corning, Cal.

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs, \$8.50 per 100; \$50 per 1000. Labranza Ranch, Athlone, Merced Co., Cal.

For Sale—First class re-cleaned alfalfa seed that has been inspected in the field by the Horticultural Commissioner, and is free from noxious weeds. Also choice Peruvian seed. O. C. Nordahl, Bard, Cal.

Fifty tons of choice white Egyptian corn for sale at \$30.00 per ton f. o. b. Lemoore, also a few tons of choice feterita at same price. C. R. Flory, Lemoore, Calif.

Peruvian Alfalfa Seed—Hairy varieties, also Algerian wheat. S. P. Huss, Yuma, Arizona.

Ahuacate (Alligator Pear) seed for sale, \$4.00 per hundred. Mrs. L. M. Chaffee, Box 742, Sherman, Cal.

POULTRY

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., 607 E. Third St., Los Angeles, Cal.

S. C. Rhode Island Reds, Lester Tompkins and Winslow strains eggs for hatching. Day old chicks. Prices on application. Raines Court Poultry Ranch, Zelzah, Calif.

San Francisco. Seattle.

Do Your Eyes Trouble You?

If So, Consult an Experienced Specialist

Eyesight is a priceless possession, yet many people neglect their eyes until too late. Perfect vision is a real blessing—every person owes it to himself to preserve it. Those who have difficulty in seeing properly should lose no time in consulting a competent eye specialist—an oculist. The danger of strain on the sensitive nerves and delicate muscles can hardly be overestimated.

Dr. C. N. Hopkins, the noted oculist, speaking of the ailments many times due to defective eyesight, says that indigestion, headaches, neuralgia, and nervous ailments are included among the long list. He further states that glasses are not always needed to eliminate these causes; skilled treatments often form an important part. He says that if the public were educated to go to a specialist for timely advice as to the care of the eyes, less than 50 per cent of the people with an incurable eye defect would be in that condition.

Dr. Hopkins, during his nineteen years of experience in Los Angeles, has successfully treated and prescribed for thousands of eye cases. The equipment of his offices in the Homer Laughlin Building, 315 South Broadway, Los Angeles, is exceptionally complete. He does not use drops in the eyes in testing for glasses.—Adv.

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Trespassing Turkeys

If C owns turkeys which D kills on his alfalfa does C have cause for action or can he recover worth of turkeys, and how should he proceed? No fences are maintained and no damage whatever was done by the turkeys.—Subscriber.

The procedure would be to commence action for such damages as can be proved. If, as stated, the turkeys did no harm to the alfalfa field, without question the full amount which it can be proved the turkeys were worth can be recovered. This necessitates suit and it is possible the owner of the alfalfa might endeavor to set up counter claim for damages to his alfalfa.

Blossom End Rot

I have a field of tomatoes about one-fourth of which appear to have dry rot. The disease is confined to one part of the field. What causes it and what remedy would effect control?—Subscriber, National City.

This sounds like a case of blossom end rot, a general description and discussion of which appears in Bulletin 239, "Culture of Tomatoes in California with Special Reference to Their Diseases," by S. S. Rogers, issued by the University of California agricultural experiment station, Berkeley. This is not a fungus and it is generally believed that it is not a bacterial trouble. The only treatment recommended in this bulletin is to keep the plants growing steadily. Irrigate at regular intervals, putting on sufficient amount each time to allow the water to reach the feeding roots. Cultivate thoroughly after each irrigation.

The Best and Cheapest Way to

Control Scale and Fungus

on Citrus Trees is to spray with

Citrus Zeno

(The Standard Tree Spray)

Because

It kills the scale as thoroughly as fumigation.

It destroys the black fungus (which fumigation is not even expected to do.)

It cleans and renovates the tree. It is not a caustic material. It is easy to mix and apply. It is a proven material.

It is being used by many of the largest and most progressive growers. We operate under state license.

We can show you. And all this for one half the cost of fumigation.

Citrus Zeno sold in 50-gal. bbls. at \$14.00 per bbl., f. o. b., Los Angeles.

For summer and fall spraying dilute at the rate of 1 gal. Citrus Zeno to 30 gals. water.

Made by

Standard Chemical Company

Rainfall—Government Land

Where can I secure information as to location of homesteads in California, also rules for homesteading? To whom should I write to learn as to rainfall of certain counties?—Subscriber, Tulare.

Write Secretary of the Interior, Washington, D. C., for Suggestions to Homesteaders, Circular No. 224, also Classification of Public Lands, Bulletin 537, and for the Three Year Homestead Law, Bulletin 132. Write the land office of the district in which there are lands on which you wish to file. If in the district from which you write the nearest land office is at Visalia. As to rainfall, you will probably be able to get from United States Weather Bureau, San Francisco, tables showing precipitation in nearly every county of the state.

Rat Poison

Please give formula for an effective rat poison.—Subscriber, El Monte.

Bulletin 33 of the United States department of agriculture, "The Brown Rat in the United States," gives the following: "One of the cheapest and most effective poisons for rats and mice is barium carbonate. This mineral has the advantage of being without taste or smell. It has a corrosive action on the mucous lining of the stomach and is dangerous to larger animals if taken in sufficient quantity. In the small doses fed to rats and mice it would be harmless to domestic animals. Its action upon rats is slow, and if exit is possible they usually leave the premises in search of water. For this reason the poison may frequently, though not always, be used in houses without disagreeable consequences. Barium carbonate may be fed in the form of dough composed of four parts of meal or flour and one part of the mineral. A more convenient bait is ordinary oatmeal with about one-eighth of its bulk of the mineral, mixed with water into a stiff dough. A third plan is to spread the barium carbonate upon fish, toasted bread (moistened) or ordinary bread and butter. The prepared bait should be placed in rat runs, a small quantity—as a teaspoonful—at a place. If a single application of the poison fails to kill or drive away all rats from the premises, it should be repeated with a change of bait." Strychnine is also good. The dry crystals may be inserted in small pieces of raw meat, sausage, or toasted cheese, and these placed in rat runs or burrows, or oatmeal may be moistened with a strychnine syrup, and small quantities laid in the same way. Strychnine syrup may be prepared by dissolving a half ounce of strychnia sulphate in a pint of boiling water, adding a pint of thick sugar syrup and stirring thoroughly. In placing bait in runs or burrows be sure that domestic animals cannot gain access to it.

White Grubs in Ferns

I have a nice collection of ferns of different varieties but am troubled with small white worms at the roots or just under the soil. They are about the size of a pin. What can I put in the soil to kill the worms or will it be necessary to repot the ferns?—Subscriber, Porterville.

Lime water will usually drive these pests from the soil. For instance, if a pound of lime is thoroughly slaked and diluted with one and a half or two gallons of water, a cup of this added to the soil in the pots will probably destroy every one of the worms and will not prove injurious to any plant that we have ever tried it on. We do not believe it would injure ferns. Another remedy is white hellebore which is said to be an excellent remedy against nearly all root or soil maggots. Use at the rate of one ounce in a gallon of boiling water. When cool apply in sufficient quantity to saturate the soil.

Dependable Quality Means

care in manufacture—proper materials in correct proportions—years of experience—a trained organization—results.

ORCHARD BRAND Lime Sulphur Solution, Atomic Sulphur and Bordeaux Mixture, are so prepared as to avoid unnecessary labor, dependable in quality, uniform and in proper consistency.

ORCHARD BRAND Crude Oil Emulsion and Miscible Oil are especially effective for killing scale insects and aphid eggs.

Arsenate of Lead, an **ORCHARD BRAND PRODUCT** is a standard poison for killing all chewing insects.

Our information bureau is at your disposal free of charge. When writing state quantity and kind of material desired, or give the age, number and kind of trees and the pest you wish to control.

WHEN THE FROST IS ON THE PUNKIN.

When the frost is on the punkin and
the fodder's in the shock,
And you hear the kyouck and gobble
of the struttin' turkey cock,
And the clackin' of the guineas, and
the cluckin' of the hens,
And the rooster's hallylooyer as he
tiptoes on the fence;
Oh, it's then's the time a feller is
a feelin' at his best,
With the risin' sun to greet him from
a night of peaceful rest,
As he leaves the house bareheaded and
goes out to feed the stock,
When the frost is on the punkin and
the fodder's in the shock.

They's something kind o' harty like
about the atmosfere,
When the heat of summer's over and
the coolin' fall is here—
Of course we miss the flowers and the
blossoms on the trees,
And the mumble of the hummin' birds
and buzzin' of the bees;
The air is appetizin', and the land-
scape through the haze
Of a crisp and sunny morning of the
airly autumn days
Is a pictur' that no painter has the
colorin' to mock—
When the frost is on the punkin and
the fodder's in the shock.

The husky, rusty rustle of the tassels
of the corn,
And the raspin' of the tangled leaves,
as golden as the morn;
The stubble in the furries—kind o'
lonesome like, but still
A preachin' sermons to us of the barns
they grewed to fill;
The strawstack in the medder, and
the reaper in the shed;
The hosses in their stalls below—the
clover overhead—
Oh, it sets my heart a clickin' like the
tickin' of a clock,
When the frost is on the punkin and
the fodder's in the shock.

When your apples is all gathered, and
the ones a feller keeps
Is poured around the cellar floor in red
and yeller heaps,
And your cider makin's over, and your
wimmen folks is through
With their mince and apple butter,
and their sauce and sausage too;
I don't know how to tell it—but if
such a thing could be
As the angels wantin' boardin', and
they'd call around on me—
I'd want to 'commodeate 'em—all the
whole indurin' flock,
When the frost is on the punkin and
the fodder's in the shock!
—James Whitcomb Riley.

FATE

Dorinda Mills carefully muffled the
front door bell and removed the gate
from its hinges to a safe place in the
woodshed. Then she closed and fast-
ened the old-fashioned wooden shut-
ters that no mischievous boy might
construct a nerve-irritating "ticktack"
against the window pane.

"I guess those boys'll find mighty
little to play the mischief with this
Halloween," remarked Dorinda as she
complacently opened the weekly news-
paper.

Outside the little house, the October
wind blew crisply through the dead
leaves and shrilled defiantly down the
wide-mouthed chimney. Indoors the
sitting-room was snug and warm with
the cheery light from the green-shaded
lamp falling on Miss Dorinda's brown
hair and pretty blue dress.

Suddenly, out of the commonplace
paragraphs of village happenings, a
few lines sprang out as if writ in let-
ters of fire:

"Daniel Fuller of New York City
has been spending a few days with his
father at the old homestead. It is un-
derstood that Mr. Fuller will return at
Christmas and claim a bride chosen
from among Elmwood's fairest daugh-
ters.

The paper rattled to the floor while
Dorinda stared unseeing at the leaping
flames in the fireplace, where bright
pictures took shape and faded to give
place to others more sombre and
lonely.

Her first response to Dan Fuller's
tender wooing and their engagement;
the preparations for their wedding on
Halloween; their bitter quarrel a
week before the date and the broken
engagement that followed; Dan's de-
parture for the city, where he buried
his sorrow in business matters—all
these things came before her as she
sat in the lonely brown house.

Dorinda never had admitted to her-
self that she still loved Dan Fuller;
she simply ignored the fact that he
had ever existed in her life, and out-
wardly went on in her calm, unruf-
fled way, living alone in her girlhood's
home.

For the first time in 15 years she
had barricaded herself against Hal-
loween merrymakers. The recurring
anniversary of her wedding day always
jarred upon her sensibilities, but she
had fought down the desire to hide
herself behind closed doors while the
youthful countryside played pranks.

She was glad to be alone with the
newspaper paragraph about Dan Ful-
ler's marriage! Who could it be that
he had chosen from among Elmwood
girls—the fairest daughters of the
village—so the Bugle had announced?
Perhaps one of the pretty Lansing
twins—

There were guarded footsteps on the
front porch, and then the bell gave
forth a stifled peal. The boys were
at their usual mischief. Again the bell
pealed, and the steps died away from
the porch and presently crackled on
the hard gravel of the path around the
windows.

Someone rapped smartly on the
closed shutters and from a distance
came suppressed laughter. Then all
sounds ceased and silence fell upon
the house.

An hour later the bell pealed once
more and again the closed shutters
were rattled, but Dorinda did not move
from her chair.

The tall clock in the hall had
chimed the quarter hour before 12
when she at last arose and, standing
on tiptoe lifted from the wall a small,
round looking glass. She hastily blew
out the light and felt her way to the
side door and presently stood on the
porch in the pale moonlight, looking
like a ghost herself with her white
face and wide startled eyes.

"I used to do it—before I met him,"
said Dorinda to herself: "there must
be some fate for me, too! I can't go
on forever just thinking and think-
ing!"

Many Halloweens ago fate had
shown her Dan Fuller's handsome
face in the mirror beside her own and
she had turned to find his arm about
her waist. Tonight she made the cir-
cuit of the house with a heart beat-
ing as wildly as it had sixteen years
ago, and when she stood again be-
fore the side porch the moonlight re-
vealed no face save her own, pale
and quivering.

With a gesture of disgust she
tossed the mirror into the shrubbery.

"Dorinda Mills, you're the silliest lit-
tle fool! Don't you know that you've
just got to live all alone the rest of

Star Oil Gas Burner

to friends and neighbors.
STAR OIL GAS BURNER CO.,
Pasadena, Cal.

COOKING ON A
GAS RANGE

HOME-MADE ACETYLENE

is not poisonous
to breathe

The home paper will print your obituary in the next issue—if you ever "blow out the gas" when you visit your cousin in the city. But when your city cousin comes to your country home, he can blow out your acetylene gas light and it won't hurt him a bit to breathe it all night.

Your Home-Made Acetylene gas is much the best in many other respects. A hundred cubic feet of it will give you more light for your house and barn than a thousand feet of your cousin's city gas. Your light will also be far more brilliant and beautiful, and your acetylene cooking range will have every feature of the finest gas range used by the cities' millions.

To make acetylene for country home use you require an automatic generator. You simply feed this generator the gas producing stone, *Union Carbide*, about once a month—the machine does the rest.

The use of Home-Made Acetylene has grown steadily while a hundred other

In gray drums
with blue bands

competing light propositions have died by the wayside. Today we supply *Union Carbide* to over a quarter of a million country home families.

Modern acetylene generators are wonderful improvements over the earlier kinds with which you may have been familiar. We will be very glad indeed to have you ask us any question that may come to your mind.

You will find our advertising literature intensely interesting. Address

FOR FIGHTING FIRE USE GARSTANG GRASS BURNER

For the city lot owner, or rancher. Designed solely for fighting dangerous and useless brush and weeds. Clears off city lots or vacant acreage. Kills the seed of weeds and rank vegetation at the right season. Safe, inexpensive and an efficient safeguard against accidental fires. Burns oil, distillate or gasoline. Prices on application.

Richard Garstang, Patentee, 224 W 30 St., Los Angeles

your life and sew and sew!" She broke into a little sobbing laugh and turned to enter the house.

A shadow detached itself from the tall shrubs and came across the turf. "Dorinda Mills," said the shadow in a strangely familiar voice—a voice that belonged to Dorinda's youth.

"What do you want?" asked Dorinda boldly. "Who are you?"

The shadow evolved itself into a man's tall form. He paused before her and turned his face toward the moonlight. "Daniel Fuller," he said quietly.

"O!" said Dorinda breathlessly.

"I came to see you earlier this evening—I rang the bell, but you did not answer. I came around the house and found the shutters closed. I supposed you were away and so I sat in the garden awhile—we used to sit there, Dorinda, you remember?"

Dorinda nodded her brown head.

"It is not much like the garden I remember, that was full of roses," he said musingly. "You remember that, too, Dorinda?"

"Yes," she said, slowly.

"I remember everything—everything—and because I did remember I came back tonight—I am going away tomorrow and next week I must leave on an extended Western trip—will you forgive a fool, Dorinda, and marry him and go along, too?"

"No—no—" she cried sharply, leaning against the pillar of the porch. "I can not do that!"

"Why not?" he demanded. "Then you don't care for me. Of course, after all these years you would forget," he said hopelessly.

"I have not forgotten," she retorted; "only—only you saw me running around the house with that ridiculous mirror—and you are sorry for me—and you are asking me out of pity!"

"Your eyes are the mirror of my fate, Dorinda. Look in them and you will see your own sweet face."

"And yours in mine, Dan," she whispered softly.

SOME HALLOWE'EN SUGGESTIONS

Jack-o-lanterns

Everybody, old and young, is acquainted with the jolly pumpkin jack-o-lantern family, but if you want more jack-o's than you have pumpkins, take pasteboard boxes and cut in one side faces or outlines of animals or other figures. The outline should first be traced upon the box; back of the cut-out places paste colored tissue paper; fasten a small candle in the bottom of the box with pins. It is best to use one end of the box for the bottom and fasten the lid to the box as a door. Miniature jack-o-lanterns for table decorations may be made of scooped-out apples or large cucumbers; the bell-shaped white squashes also furnish an effective oddity.

Decorating Cakes

Cookies which will grace a grown-up Halloween celebration or delight the hearts of a youngster's party are easily made as follows: Ice smoothly vanilla wafers or small homemade sugar cookies. When the icing is dry, make some melted sweet chocolate by grating the chocolate into a dry bowl and melting over a tea-kettle whose steam will keep the chocolate fluid enough to work with. With this draw with a toothpick or perfectly clean small camel's hair brush, little brownie heads, surrounded by a ring, one-fourth of an inch inside the outer edge of the cookie. Any little head that you can find in a magazine or book may be used, if you prefer—or just plain jack-o-lantern heads would be equally attractive.

The Supper

A good menu for the Halloween supper, may consist of the following: Oyster soup, cold sliced chicken, sandwiches, olives, cheese, ice cream in small paper pumpkin cups, chestnuts, bonbons, angel food cake and coffee. Fake candies may be made by covering marbles with candy fondant, for one knows the evil spirits will mix bad candy with dainty confections. Hot roasted chestnuts and peanuts may be served during the meal or afterward when the ghost stories are being told.

Choosing Partners

Something new in regard to choosing partners at a Halloween party is

Redeem Your Karo Syrup Labels —Karo Premium Offer

SEND us labels from 50c. worth of Karo (red or blue) and 85 cents and receive this Wonderful 10½ inch Aluminum Griddle by prepaid parcels post. This griddle retails regularly at \$2.25. It cooks uniformly on entire baking surface. Needs no greasing, therefore does not smoke, is as light and bright as a new dollar, never rusts, easily kept clean, will not break and lasts a lifetime.

At great expense we are seeking to place a Karo Aluminum Griddle in the homes of all Karo users, so that Karo—the famous spread for griddle cakes and waffles—may be served on the most deliciously baked cakes that can be made.

Karo the Syrup Choice on Thousands of Farm Tables

THE woman who keeps the syrup pitcher filled knows better than anyone else how strong the men of her household are for Karo on the griddle cakes, hot biscuits, bread and waffles.

She may not know how many thousand cans of Karo are used in her home state, but she does know how often her own Karo pitcher is emptied. The forehanded housewife buys Karo by the dozen and keeps it in the pantry ready for the daily filling of the syrup pitcher.

Great Majestic

Awarded
"GOLD MEDAL"
Highest Award
Panama Pacific Exp
San Francisco

The "Thoroughbred"

It's as poor policy to keep a "scrub" range in the kitchen as to keep a "scrub" cow on the farm. Whether it be range or cow, the cost of keeping a scrub is more than that of the thoroughbred—and the results are less.

The Majestic is the thoroughbred among ranges. It takes a small "feed" of fuel and gets the utmost cooking value out of it, because it distributes the heat where it will do its best work and keeps it there—the heat can't leak out of the ever-tight, cold-riveted Majestic. With no heat wasted, less fuel is used.

The Majestic oven never fails you because its scientific construction circulates the heat evenly to all parts of oven; and its heavy

asbestos lining reflects the heat all over and under the baking; perfectly baking and browning all sides, without turning.

The Majestic body of charcoal iron resists rust three times as long as steel; and its top, doors, frames, etc., made of tough, malleable iron are unbreakable. Repair expense is reduced to practically nothing.

The little extra price of a Majestic is soon saved by its economy in fuel, food and repairs—and it outlasts three ordinary ranges.

There is a Majestic dealer in nearly every county of 42 States. If you don't know one near you, write us and we will tell you who he is.

One quality, many styles and sizes, with or without legs.

Write for Book.

Tells what to look for and what to avoid when buying a range. You can't judge a range by looks. You should know how they are made and why.

IDEAS FOR HALLOWE'EN

Continued from Page 429

to have the house darkened and each
young man given a tiny candle which
he must light and then go in search
of a girl partner. The girls are to be
hidden all over the house, and since
the candles do not last long, the search
must be expeditious and interesting.

SIMPLE MENU FOR HALLOWE'EN

Nut Gingerbread Coffee
Rosy-Cheeked Apples and Nuts
Here is the recipe:

Nut Gingerbread

Sift three-quarters of a pound of
flour into a basin, add one cup of
chopped walnut meats, half a teaspoon
of salt, half a teaspoon of soda, one
teaspoon of ground ginger, one tea-
spoon of ground cinnamon and a little
grated nutmeg. Melt together in a
saucepan one cup of molasses, four
heaping tablespoons of sugar, four
tablespoons of butter and half a cup
of milk. Cool and add to the dry in-
gredients with two well-beaten eggs.
Mix well, then pour into a buttered
and floured cake tin. Bake in a mod-
erate oven three-quarters of an hour.

The gingerbread may be served
plain in the good old-fashioned way, or
it may be cut in squares, decorated
with white frosting, and a tiny candy
pumpkin placed on each portion while
the icing is still soft.

HALLOWE'EN SUPPERS

Shredded pineapple and orange
cocktails served in shells of bright red
apples. "Little pigs in blankets"—
fried oysters rolled in bacon, accom-
panied by baked potatoes, broken
open and seasoned with butter and
pepper. Green peppers, stuffed with
tomatoes and garnished with a slice
of carrot, are as pretty as they are
delicious. The salad may consist of
chopped apples and chestnuts on let-
tuce leaves. The dessert could be
only one thing—pumpkin pie. Stuffed
olives and celery for the relishes, with
toasted marshmallows to end the
feast.

Another:

Little Hot Buttered Biscuits
Jellied Chicken Fruit Salad
Doughnuts Coffee

Doughnuts

One-half cup sour cream, one-half
cup milk, two eggs, one cup sugar,
one teaspoon soda, two teaspoons
cream tartar, just enough flour to
make a dough that will roll nicely. Do
not make too stiff. Whip the egg, add
sugar and cream and beat well, then
the dry ingredients sifted together.

Krogh

AWARDED

Gold Medals

The name "Krogh" has for 37
years stood for the best Irrigation
Pumps of all kinds. This name,
furthermore, stands for satisfactory
pumping service, as we watch
your pump as long as you use it.
Turbine, Verticals and Horizontal,

SPERRY SURELAY

Won

The Gold Medal

At the Panama-Pacific-International-Exposition

BECAUSE

It is a perfect food for egg producing. It contains just those food elements that keep the hens strong and healthy. It is a perfectly balanced egg food. It contains the proper proportion of protein for the white—the proper proportion of fat for the yolk—the proper proportion of lime for the shell.

What SPERRY

SURELAY

BALANCED EGG FOOD

is composed of is plainly stated on each sack and what's on the sack is in the sack and that's what's in the egg. The awarding of this Gold Medal is but another tribute to

the goodness and merit of SURELAY. It confirms the judgment of those poultrymen who feed it. It serves as an unusual inducement for all other poultry raisers to follow suit.

SURELAY is Packed in New YELLOW STRIPED Sacks. Be Sure You Get SURELAY.

Formulas and Calendar for Fighting Pests

Losses Decreased by Use of Best Methods of Control. Fungicides and Insecticides Given in Various Formulas and Calendar Showing Treatment for Different Fruits and Crops

F the losses which are caused by the pests of this country could be saved, education, national defense, and several other of our most expensive problems would be readily solved. The insects and the fungous troubles, to say nothing of the four-footed pests, cost us hundreds of millions. In fact, we doubt not it would take ten figures to express the real loss to this country. There is generally no eradication, but there is control, and with most of the pests within economic bounds. But the best control is prevention, that is, if taken in time the insect which may become millions in a few days may be destroyed and crops saved.

In any case the handling of these pests calls for intelligent consideration on the part of every farmer and fruit grower. Know which are friends and which are foes and know in a general way at least how the pests may be controlled. The spray which is effective with a fungous disease may have no effect whatever on insects. Also in the diagnosis be sure that insects are the cause of the trouble. There is often a yellowing of the leaf or other indication of sickness which comes from poor soil, air or water conditions.

If the trouble is of a fungous nature Bordeaux mixture is the best general remedy. Methods of application are given in the following pages either under the formulas or under the calendar of different plants.

Distinguish between the fungous trouble and the bacterial disease. The fungicide has no effect whatever on the bacterial trouble. The tissues of the plant are attacked in such a way that no spray will reach it. In such cases the pruning shears—disinfected after each cut—is the only efficacious remedy.

If the trouble is caused by insects there are two kinds of control. The first is typified by the grasshopper. These are the biting insects, the eaters of fruit, leaf or stem. Poisonous insecticides should then be used. The sucking type of insects may only be reached through contact sprays which destroy the tissues of the insects or smother them by making a coating over their bodies.

For particulars see the formulas and the calendar following:

FORMULAS FOR FUNGICIDES.

1. Bordeaux Mixture

The formula ordinarily used, the 5-5-50, is entirely harmless when the plant is dormant. It may also be used on some growing plants; others it will kill or greatly injure. It may be used even stronger than the formula given when the plant is dormant, but these proportions are effective with most fungous troubles. By the 5-5-50 formula is meant:

(a) Copper sulphate 5 pounds
Stone lime 5 pounds
Water 50 gallons

The weaker solution is

(b) Copper sulphate 3 pounds
Stone lime 5 pounds
Water 50 gallons

If hydrate of lime is used add one-fourth more.

To mix, dissolve the copper sulphate with water in proportion of one pound of sulphate to sufficient water to make one gallon of solution for each pound of sulphate used. The stone lime may be slaked and dissolved in water in the same proportions as the sulphate. This gives convenient stock solutions, every gallon

of which contains one pound of lime or of sulphate. To make the mixture from these stock solutions take say, for the formula (a) above, five gallons of the lime solution which will contain five pounds of stone lime and five gallons of the sulphate solution which will contain five pounds of copper sulphate. Five gallons of each of these two solutions may now be mixed with water by pouring through a strainer into water sufficient to make 50 gallons. Do not mix the solutions before pouring into the water.

2. Bordeaux Paste

The best cure for gum disease.
Blue stone 1 pound.
Fresh burned lime 2 pounds.

Dissolve the blue stone in one gallon water, using wooden or earthen vessel, by hanging it in a sack near the top of the water; slake the lime in about one-half gallon of water. Stir together when cool, making a mixture about the consistency of whitewash. Apply with a brush. May be applied to healthy bark as a preventive. Mix fresh each day or two.

3. Flowers of Sulphur

Flowers of sulphur (use high-grade) is effective on surface mildews when dusted over the plant when leaves are moist. Sulphuric acid 1-1000 has also proven successful on rose mildew and similar fungi.

4. Copper Sulphate

Copper sulphate 1 pound
Water 15 gallons

For use on dormant trees or for disinfecting seeds copper sulphate without lime may be employed. The stock may be mixed as for Bordeaux. On growing plants it may be used with a reasonable degree of safety at the rate of one pound to 100 gallons of water.

5. Corrosive Sublimate

Corrosive sublimate 2 ounces
Water 15 gallons

Corrosive sublimate or bichloride of mercury, one of the deadliest of poisons to animal life, is a very effective disinfectant and fungicide. It is one of the best preventives of potato scab. This is one of the solutions used after pruning for antiseptic dressing of wounds of trees affected with blight. It should be made and kept in wooden or earthen vessels.

6. Formalin

Formaldehyde vapor dissolved in water in what is usually called the 40 per cent solution is one of the best fungicides and is often used in place of corrosive sublimate. It is also used for treating seed potatoes, oats and wheat. It should be employed in strength of

Formalin 1 ounce
Water 2 gallons

Sulphur sprays given under "Contact Insecticides" are also fungicides, though not with the success secured through the use of the copper solution.

CONTACT INSECTICIDES

7. Lime-Sulphur

Quicklime 33 pounds
Sulphur 66 pounds
Water 200 gallons

Sift sulphur through box with screen bottom into boiling tank with 50 gallons of water. Add the lime and boil 45 minutes to one hour. Stir

frequently. Strain through cheesecloth or burlap and dilute to make 200 gallons. If extra lime is desired strain in milk of lime when spray is ready for use.

8. Commercial Lime-Sulphur

The standard strength corresponding to the above formula is obtained when commercial solution is diluted one to 11.

9. Lime-Sulphur for Use on Foliage

Commercial material 1 gallon
Water 30 to 100 gallons

Measure the water for the spray into the spray tank and add the lime and sulphur, agitating thoroughly. The variation in strength of from 30 to 100 gallons is determined by the kind and condition of the foliage.

10. Lime-Sulphur and Flour Paste

Water 200 gallons
Flour paste, 8 8 gallons
pounds flour in water
Sublimed sulphur 10 pounds
Lime-sulphur solution 2½ gallons

The flour is first made into a thin paste by adding one pound to each gallon of water, according to the above formula. The sulphur is made into a paste also and added with the flour paste and lime-sulphur solution to the 200 gallons of water in the spray tank. This spray is excellent for the red spiders on almond and citrus trees. Minus the lime-sulphur solution it is a very effective spray for the two-spotted mite, Tetranychus telarius, on hops.

11. Self Boiled Lime-Sulphur

Flowers of sulphur 8 pounds
Lump lime 8 pounds
Cold water 50 gallons

Place the lime and sulphur together in a barrel and add just enough cold water to slake the lime, stirring constantly to prevent burning. Keep a piece of old carpet or burlap sack over the top of the barrel to retain all the heat possible. Watch the mixture carefully and as soon as an orange colored liquid starts to gather on the surface add the rest of the water. Strain through a fine sieve to remove the particles of lime, but work all the sulphur through.

Do not use hot water or allow the mixture to stand after the lime is slaked and before dilution. In this spray we do not want the soluble sulphides (orange colored) to form, for these will injure the foliage and fruit. This formula is first class for summer spraying, but may be replaced with atomic or milled sulphur with practically as good results.

12. Resin Wash

Resin 20 pounds
Lye (concentrated) 5 pounds
Fish oil 2½ gallons
Water 100 gallons

Put resin, lye and fish oil, with sufficient water to cover them well, into a large iron kettle and heat until all are well mixed and thoroughly dissolved. Add cold or hot water to make when finished 100 gallons of spraying material. This is one of the oldest sprays and very adhesive. Its great drawback is the time required for mixing and the expense.

This formula is seldom used for orchard sprays because of its expense. However, it is still used successfully by nurserymen as a dip.

13. Distillate Emulsion

Distillate (28° Baume) 20 gallons
Whale oil soap 30 pounds
Water to mix 12 gallons

Dissolve the whale oil soap in the hot water, then add the distillate and stir for a short time while it is still hot. Dilute each gallon of above to 20 gallons with water.

14. Crude Emulsion

Water 175 gallons
Liquid soap 3 gallons
Crude oil 25 gallons

Fill the spray tank with the 175 gallons of water; add the liquid soap; agitate thoroughly for one minute, after which add the crude oil, continuing the agitation. If the liquid soap cannot be had, use 20 pounds whale oil soap, dissolved in ten gallons of boiling water, to which three pounds of lye have been added.

During the spraying operation this mixture should be thoroughly agitated and great care taken to wet all of the twigs. From 8 to 15 gallons should be used on a tree. The application should be made from November to February. It should be applied in the winter, when the trees are dormant.

To also kill moss or lichens on fruit trees add two pounds of lye to the formula of the stock solution.

15. Kerosene Emulsion

Kerosene 20 gallons
Whale oil soap 5 pounds
Water 10 gallons

Dissolve the soap in hot water. Add the kerosene while the suds are still hot (be careful not to get the kerosene too close to the fire) and stir thoroughly. After thorough emulsification dilute with cold water 1 to 8.

The emulsions are more satisfactory for hand pumps or even power pumps. They are less injurious to the tree and do not need as much agitation as a tree distillate spray.

16. Distillate

Distillate 28°, refined for tree use 12 gallons
Water 200 gallons

For use only with power sprayer with good agitator which is necessary to make a mechanical mixture of the oil and water.

17. Distillate-Potash

Distillate 10 gallons
Lye or caustic soda 5 pounds
Water 200 gallons

Use only with power pump and agitator.

This is one of the best home made sprays for black scale on olives.

18. Distillate-Tobacco

Distillate 4 gallons
Black leaf 40 2 to 3 pounds
Water 200 gallons

For thrips and plant lice. To be applied by power outfit with agitator only.

19. Soap Solution

Whale oil or any good soap 1 pound
Water 6-12 gallons

20. Tobacco Extract

Black leaf 40 or nicotine sulphate 2 to 3 pounds
Water 200 gallons

21. Milled Sulphur

(a) Flowers of sulphur 20 pounds

Mermaid Spray Powder

FOR
CITRUS
AND
DECIDUOUS
FRUIT
TREES

Made
in
California

Analysis Curd Soap 50%, Bi-carbonate Soda 0.5%, Carbamate Soda 37.5%, Balance Moisture.

Soap Spray An effective soap spray used in the proportion of one part of powder to six gallons of water with 200-pound pressure. Not harmful to trees or fruit if properly used.

Eradicates Scale

Mermaid Spray Powder will kill this form of pest when applied conscientiously with the above proportions at the right time. You will also note its effectiveness towards reducing red spider while spraying for scale.

Cost A cheaper and purer soap powder that is prepared with accuracy.

Uniformity Guaranteed to be at all times uniform and without lumps and to dissolve with absolutely no waste, thus saving time and money by not having your spray machine stopped to clean out impurities.

Delivery Promptness is our watchword. Any order placed with the Fruit Growers' Supply Company will receive immediate attention.

Write Us Today

We will cheerfully give reference from Professional Sprayers and Growers throughout Southern California who have tried all other Powders and have found MERMAID SPRAY POWDER without an equal. If California can produce the goods—it is up to you. Investigate.

OAKLEY PAINT MFG. CO.

1515-17 Naud St.

Los Angeles, U. S. A.

Hydrated lime 20 pounds
Thoroughly dust over the foliage, if possible when moist with dew, sulphur mixed with hydrated lime in even parts. The lime is used to increase the adhesiveness, and this has been found fully as effective and more economical than when sulphur is used full strength. If preferred mixed with water, use:

(b) Sulphur 30 pounds
Stone lime 15 pounds
Water 200 gallons

22. Carbolic Acid Emulsion

Crude carbolic acid 5 gallons
Whale oil soap 40 pounds
Water (hot) 40 gallons

The 40 gallons of water are first poured into the cooking kettle and allowed to boil. While the water is getting hot, the whale oil soap is cut into fine pieces, so as to make it dissolve easily, and added to the water. When the soap is all dissolved in the hot water the carbolic acid is added, and all is allowed to boil for a short time to insure thorough mixing. The whole operation requires less than one hour. This makes about 43 gallons of rich stock solution. For spraying the stock solution is diluted one to 20 of water, thus making approximately 860 gallons of spraying material. The stock solution will keep indefinitely, but is preferable fresh. When diluted with water it makes a perfect emulsion and can be applied with any spray pump, since an agitator is not needed. When the stock solution is allowed to stand for some time it is best to stir it up before diluting it for spraying.

COMBINED INSECTICIDES AND FUNGICIDES

It is found desirable at times to combat both the insect pests and the fungi at one application of the spray and for this a combination of the insecticide and fungicide is used. This results in a saving in the cost of labor and time spent in spraying.

Prof. W. H. Volck, horticultural commissioner of Santa Cruz County, recommends the following especially for apple pests:

The apple is attacked by a number of pests, both fungi and insects. To combat these economically the spray mixture should contain remedies for as many pests as possible.

First spraying, to be applied just as the blossoms are falling or in full bloom, according to locality:

23. Arsenate-Sulphur

(a) Acid arsenate of lead 8 pounds
Milled or atomic sulphur 5 pounds
Dilute bordeaux mixture to make 100 gallons

Where apple scab is not a factor use water instead of bordeaux.

Second spraying: apply ten days to two weeks after the first spraying:

(b) Neutral arsenate of lead 6 pounds
Milled or atomic sulphur 3 pounds
Water 100 gallons

Third spraying. Repeat the second spraying formula in about three weeks.

If it is desired to control aphids add one to two pounds of black leaf 40 to any of the above.

24. Bordeaux-Arsenate of Lead

Neutral lead arsenate 3 pounds
Bordeaux mixture 50 gallons

Where a stronger poison is desired the arsenate of lead can be increased to three or four pounds. A more uniform distribution of the arsenate of lead is secured throughout the spray when it is added to the milk of lime instead of placing it in the spray tank.

25. Lime-Sulphur-Arsenate of Lead

(a) Neutral lead arsenate (neutral by ammonia test) 3 pounds
Dilute lime-sulphur (see 10) 50 gallons

or

(b) Arsenate of lead 2 pounds
Self boiled lime and sulphur 50 gallons

Have the arsenate of lead in the form of a smooth paste and add to the lime and sulphur solution at the same time stirring the spray thoroughly. If a power sprayer is used it is advisable to keep the agitator working.

“They Are Best by Every Test”

When writing advertisers, mention The Cultivator.

POISON INSECTICIDES FOR CHEWING INSECTS.

26. Lead Arsenate

Neutral lead arsenate	
(neutral by ammonia test)	3 pounds
Water	50 gallons

27. Vegetable Bait

Valuable protection of gardens and low growing plants may be had by use of a vegetable bait which grass hoppers, army worms and similar pests may prefer to the growing crop. Spray portion of alfalfa or white clover with a solution of

Paris green	1 pound
Water	150 gallons

then distributing where protection is needed, preferably at night as the bait will keep its freshness longer and also because the principal depredations of the pest are at night.

28. Bran Mash

Bran or flour	10 parts
Paris green	1 part
Molasses or glucose	2 parts

29. Citric Bran Mash

Part 1—

White arsenic or Paris green	2½ pounds
Bran	50 pounds

Mix these dry.

Part 2—

Lemons (chopped fine, including rind)	½ dozen
Syrup or molasses (cheap)	4 quarts
Water	5 gallons

Mix these together.

Mix Part 1 and Part 2 and add enough water to make a wet mash. The parts should not be mixed until ready for use. Distribute broadcast in front of the pests early in the morning.

DUSTS

30. Sulphur and Lime

Even better than sulphur alone is hydrated lime and flowers of sulphur mixed in equal parts and blown upon the trees with a power machine. In the citrus orchards this is a very important method of controlling the citrus red spider and the two-spotted mite.

31. Pyrethrum

One of the very best of insecticides, especially for household use where poisons are dangerous. Usually sold in California under name of buhach. Buy fresh and in original packages.

32. White Hellebore

White hellebore	1 pound
Water	50 gallons

Mix the hellebore with a small quantity of water and pour into the spray tank containing the required amount of water.

It may be applied as a dust spray by mixing with five to ten parts of flour or road dust, and with this dust the plants when the dew is on, either early in the morning or late in the evening. White hellebore loses its strength rapidly and should be kept in airtight receptacles.

Also effective against root maggots, especially those affecting cabbage and cauliflower. Make decoction of one ounce to one gallon of water, a cupful of which may be poured about the plants whose roots are infested. Excellent for potted plants.

33. Dry Arsenate

Experiments the past year have shown dry powdered arsenate of lead of high quality effective against corn ear worm or eating insects infesting other plants. The powder is placed in cheesecloth or coarse muslin bag and shaken over corn as it is coming into silk or over plants.

Where preferred bellows dusters may be used. Large dust machines have been used to a limited extent but under California arid conditions are not so generally used as liquid sprays.

FUMIGATION

34. Hydrocyanic Acid Gas

Fumigation is a rather complicated process for a layman to take up; it is the work of the specialist and this year has shown that to secure best results machinery should be used. The best of tents are always necessary. Cyanide of sodium has entirely re-

placed cyanide of potassium. An ounce of cyanide of sodium for each 100 cubic feet is perhaps a fair average for killing dose.

In handling this gas care must always be exercised for the chemicals are deadly poisons and the gas means death to the higher animals as well as to the insects. In fumigating buildings close all cracks before chemicals are brought together and the operator must get out of room immediately after bringing acid and cyanide together. Still better is a pulley system of lowering the cyanide into the acid after the operator has retired.

Rooms should not be entered for ten or 12 hours and then with care. Excepting where strong dosage is necessary the following will prove effective:

Sodium Cyanide:

Sodium cyanide	1 ounce
Sulphuric acid	1½ fluid ounces
Water	2 fluid ounces

The acid and water are mixed in the vessel and the cyanide dropped in at the last moment.

35. Carbon Bisulphide

Carbon bisulphide, one pint to each 1000 cubic feet of space. Place liquid in saucers or shallow vessels near top of room or over seed to be fumigated. For underground insects a tablespoonful placed in holes a few feet apart and covered tightly, works satisfactorily. For squirrels place one ounce on a piece of cotton, insert in hole and tamp tightly.

Government agents have perfected a squirrel destructor for use in applying the bisulphide. It consists of a chamber in which is a supply of bisulphide of carbon and a set of valves which enables the operator to pump the hole full of the deadly gas. Its operation is so effective and so simple that it is proving one of the most economical methods of ridding lands of squirrels. It must be borne in mind that in very dry soils the gas is dissipated so rapidly through the porosities that this treatment cannot be thoroughly effective.

MISCELLANEOUS

36. Sulphate of Iron for Weeds

Many weeds are susceptible to a spray of sulphate of iron and some, especially mustard, are so sensitive to it that spraying a grain field will often eradicate the mustard and still leave the grain growing lustily. A very strong solution is used:

Sulphate of iron	100 pounds
Water	50 gallons

Dissolve by constant agitation.

37. Torch for Dodder

Dodder, a most perplexing pest of alfalfa and other crops, may be controlled by the use of a gasoline torch burner. The kind with a chamber for compressed air and of large capacity is necessary. After cutting alfalfa, use the torch over infested spots in the field.

38. Tree Whitewash

In order to prevent sun scald whitewashing the trees or protecting by shade is at times necessary. Where a tree has been severely cut back or where a protecting limb has been broken off apply to the exposed limbs and trunk the following, known as California Tree Whitewash:

(a) Quicklime	30 pounds
Tallow	4 pounds
Salt	5 pounds
Water enough to make the mixture flow freely.	

(b) Waterproof Whitewash.

(1) Quicklime	62 pounds
Water (hot)	12 gallons
(2) Common salt	2 pounds
Sulphate of zinc	1 pound
Water (boiling)	2 gallons
(3) Skimmed milk	2 gallons

(1) Slake the lime thoroughly; (2), dissolve the salt and sulphate of zinc in the two gallons of water; pour (2) into (1) and add (3). Mix thoroughly. Two pounds of flour paste (dissolve in two gallons of hot water) may be added instead of the skimmed milk.

39. Tree Barriers

Use the commercial tree tanglefoot, or if preferred mix as follows:

Mix with a gentle heat one pound of resin and one gallon of castor oil, and when cold thin as desired with more castor oil. One of the best ways to

HURST SPRAYERS

The Famous Quality Line

The result of 28 years' practical experience in building sprayers. Hurst Sprayers have stood the test of time and stand today head and shoulders above all competition. The big success of the Hurst line can be summed up in one word "Simplicity." Every Hurst Sprayer is a marvel of simplicity. No unnecessary parts to cause trouble and annoyance. Combined with simplicity they have the greatest convenience and utility.

32 Different Styles

A quality sprayer for every known need. Man, horse and gasoline engine power. Various sizes and styles of power sprayers, with and without engines. The Acme, shown below, is an exceedingly popular machine with the Western grower.

Get our Big FREE Book

This book should be in the hands of every fruit grower and farmer. Used as a class book in many of the Agricultural Schools. Contains 74 illustrations and descriptions of insect and fungus pests and gives the remedy for each. Shows our complete line of sprayers.

The Law says KILL 'EM

Did you know there's a California law compelling all persons to rid their land of ground squirrels? But law or no law, you're alive to the damage these pests do to crops and trees and land. You want a cheap, easy way to fight them.

KILMOL SQUIRLGOPHENE

The United States
Destructor
Use Kilmol
Gives 100% Effi-
ciency

Is simple, sure, quick and practical. Saturate balls of hemp-waste in Kilmol, place one in burrow and ignite. The deadly fumes remain in the burrow for hours—the rodents can't escape. 100 per cent efficient first time. Used by government, state and county officers. Ask your dealer. Write for interesting information about rodent eradication.

Herbert F. Dugan
1170 Sutter Street
San Francisco, Cal.

apply it is to saturate a piece of baling rope with the well thinned mixture and tie around the trunk of the tree. This will remain sufficiently sticky about ten days, as long as anything of the kind we know of. A strip a few inches wide surrounding the tree trunk, placed in the fall and tended during the winter will prevent the ascent of the cankerworm moth. Placed in hop vines it prevents ascent of the hop flea beetle. Will bar Argentine ants or most other insects that reach the foliage by crawling only.

Cotton Bands. A four-inch strip tied around the tree by a string at the lower edge, and the top then pulled down over the string is in use against Fuller's rose beetle on the orange, and other beetles and worms.

Asphaltum. A strip six or eight inches wide painted about base of tree trunk will prevent the entrance of the peach tree borer.

40. Potato Bait

Wire worms, which have proven a great pest in some lima bean sections, have been successfully trapped by using potato bait. Before planting the beans potatoes cut in two have wire attached with small cloth or other signal and the potato is buried two or three inches under the surface. Wire worms are attracted and when bait is lifted out a day or two later it is often nearly covered with the worms. These are shaken into oil or other liquid and destroyed. The cost is said to be not over \$3.50 to \$5 per acre.

The calendar which follows gives only the number of the formula which is given in the preceding columns. That is, instead of giving particulars of sulphur-lime wash under "Aphis, Green" we say "apply 7 or 8," referring to the numbers of those formulas.

APPLES, PEARS AND QUINCES

Insect Pests

Aphis, Green (Aphis mali). Apply 7 or 8 just before buds open, if orchard has been badly infested in past years. Apply 15, 18 or 20 as soon as the insects make their first appearance.

Aphis, Leaf-Curling (Aphis sorbi). Seven or 8 plus Black Leaf 40, one pound to 100 gallons. Apply when the buds are beginning to open, pink showing in a few blossoms; spray very thoroughly.

Aphis, Woolly (Schizoneura lanigera). Spray with 15, 18 or 20 whenever this pest appears above ground. Use at least 150 pounds pressure. For underground forms proceed as follows: Remove soil until upper roots are exposed at the base of the tree. Pour several gallons of 20 around crown and replace soil when it has soaked in. Repeat often.

Bud Moth (Lithophane antennata). Use 7 in winter and 26 before leaf buds open and after blossoms fall. Repeat every ten days if necessary.

Brown Apricot Scale (Lecanium corni). Apply 13, 15 or 16 just as soon as leaves fall. Applications should be made before December 1.

Codling Moth (Carpocapsa pomonella L.). Apply 24 or 26. Continue to spray at intervals of ten days or two weeks throughout the season (at least four times).

Canker Worms, Fall Canker Worm (Anesoptryx pometaria Harris). Spring Canker Worm (Paleacrita vernata Peck). Apply 26 when worms first appear. Spray as often as needed. Tanglefoot bands on the trees are very effective in keeping the caterpillars from the trees.

Tussock Moth. Spray in full bloom with zinc arsenite, six pounds to 200 gallons, and follow in ten days with neutral lead arsenate, 15 pounds to 200 gallons.

Greedy Scale (Aspidiotus camelliae). Apply 7, 9 or 16 when trees are dormant. This scale seldom needs treatment.

Oyster Shell Scale (Lepidosaphes pomorum). Apply 7 or 9 when trees are dormant.

Pear Slug (Selandria cerasi Peck). Dust on Paris Green, hellebore or pyrethrum.

San Jose Scale (Aspidiotus perniciosus). Apply 7 or 17 when trees are dormant. If 8 is used be sure it is no weaker than given. Repeat in spring.

The Best and Cheapest Way to

Control Scale and Fungus

on Citrus Trees is to spray with

Citrus Zeno

(The Standard Tree Spray)

Because

It kills the scale as thoroughly as fumigation.

It destroys the black fungus (which fumigation is not even expected to do.)

It cleans and renovates the tree. It is not a caustic material. It is easy to mix and apply. It is a proven material.

It is being used by many of the largest and most progressive growers. We operate under state license. We can show you.

And all this for one half the cost of fumigation.

Citrus Zeno sold in 50-gal. bbls. at \$14.00 per bbl., f. o. b., Los Angeles.

For summer and fall spraying dilute at the rate of 1 gal. Citrus Zeno to 30 gals. water.

A Good Salesman is Always Wanted

The pumps made by the Krogh Manufacturing Company, of San Francisco, are supplying most of the water used on the Panama-Pacific Exposition grounds.

Fungoid or Bacterial Diseases

Black Spot Canker (Myxosporium curvisporum Sacc.). Apply 1-a. the first and 15th of November.

Bitter Rot (Glomeralla ruformaculans). Apply 1-b. at first appearance of rot. Repeat every two weeks if needed.

Moss or Lichens. Apply 1-a, 7 or 17 when trees are dormant.

Pear Blight—No spray effective. The only treatment consists in cutting off blight as fast as it appears. Cut below affected parts so that good live wood is secured. Sterilize implements after each cut by dipping them in 5 or 6.

Powdery Mildew (Podosphaera oxycanthae). Apply 1-a when trees are dormant, then 1-b during spring and early summer. Remove mildewed tips in winter. Apply 7 just before buds open.

Apple Mildew. Cut off infested tips both winter and summer, also prune back all twigs somewhat as apricots are pruned. Spray with arsenites and Bordeaux combined.

Sappy Bark. Cut away diseased parts when trees are dormant.

Scab (Venturia inaequalis, Winter). Apply 1-a before buds start. Spray again with 1-b as soon as blossoms fall. Repeat several times at intervals of three or four weeks. (This should be done especially if the weather is damp.)

CITRUS FRUITS.

Insect Pests

Black Scale (Saissetia oleae) Fumigate with 34 during period between September 1 and January 1. Spray young trees with 12 or 16 during the months of September, October and November. Remove nightshade from orchard before fumigation to prevent reinfection. Fumigate also olive trees or oleanders which may be near your orchard.

Chaff Scale (Parlatoria pergandii). Fumigate with 34 at any season.

Fuller's Rose Beetle (Aramigus fulleri). This insect cannot fly and can be kept from the trees by means of tanglefoot bands.

Hemispherical Scale (Saissetia hemispherica). Same as for Black Scale.

Long Scale (Lepidosaphes gloverii). Fumigate as soon as found with 34. Repeat if living forms are found a month later.

Mealy Bugs: Long Tailed Mealy Bug (Pseudococcus longispinus); Citrus Mealy Bug (Pseudococcus citri); Fumigate as soon as found with 34 applied as follows: Give regular dose and at the end of one hour's exposure repeat the dose and expose for another hour, thus making the dose twice 34 and the entire exposure two hours.

Oleander Scale Aspidiotus hederae). Fumigate with 34. Not a serious citrus pest

Orange Aphis (Aphis gossypii glover). Spray with 15 or 20 as soon as found.

Purple Scale (Lepidosaphes beckii). Fumigate with 34 as soon as located and repeat in one month if necessary.

Red Scale (Crysomphalus aurantii). Treat same as Purple Scale.

Red Spider (Tetranychus mytilaspidis). Apply 21-b or commercial lime-sulphur when foliage is damp. Repeat until pests disappear. A new practice which has given excellent results is obtained by adding flour to the spray as follows: Four pounds flour to 100 gallons water. Make a paste of the flour, using the proportion of one pound flour to one gallon cold water, strain and add in proportion required to each tank of spray material. The advantage in using flour is that it prevents the spotting so often noted in use of lime-sulphur spray, which injures the fruit, and spreads in a thin film over the tree.

Yellow Scale (Chrysomphalus aurantii citrinus). Treat same as for Purple and Red Scale.

White Cottony Cushion Scale (Icerya purchasi, Mask.). This pest is handled perfectly by its natural enemy, Novius cardinalis, commonly called the "Vedalia," which may be had from the State Insectary, Sacramento. Release colony at any time of year scale appears.

White Fly (Aleyrodes citri). Defoliate trees when the larvae appear and scrub with 17 or 19. Better to fumigate with 34.

Thrips (Euthrips citri). Spray with 18 in spring.

Army Worms (Various species). Apply 28 under trees; also if they have not already secured access to orchard, surround trees with deep furrow, vertical side toward trees. If cover crops are growing, remove such growths as project up into branches of the trees. Paint tanglefoot bands around tree trunk. (See 39).

Fungoid and Bacterial Diseases

Brown Rot (Pythiacystis citrophthora). Sow cover crop in orchard. Plow under in spring and cultivate well under the trees. In washer use 6, bluestone, or permanganate of potash. Eliminate infected fruit and disinfect boxes and picking sacks.

Dieback (Bacterial). Improve physical conditions of trees by deeper and more thorough tilling of soil. If excessive applications of nitrogenous fertilizers have been made, discontinue until tree has resumed normal conditions.

Gum disease, formerly considered a physiological trouble, now best treated by raking away dirt from trunk of tree, scraping off all diseased bark or tissue and painting with No. 2.

Mottle Leaf (Physical). Improve physical condition of tree by deep culture. Make applications of lime and manure to soil. Examine soil as to hardpan, and if it exists, break up if possible.

Smut (Meliola camelliae, Sacc.). A fungous growth caused by honey dew

exuded by scale insects, plant lice and white fly. Remove pest and smut will disappear.

Wither Tip (Colletotrichum gloeosporioides, Penz.). Apply 1-a as soon as it appears and repeat as often as necessary.

DATES

Marlatt Scale. (Phoenicococcus marlati). Dip young plants or spray old ones with a solution of phenol.

Parlatoria Scale. (Parlatoria blanchardi). Most effective treatment burning with gasoline torch.

OLIVE

Insect Pests

Black Scale. Best treatment, fumigation with 34 October-January. If sprayed use 12, 13 or 15. Annual spraying not effective. When young insects appear in large numbers on leaves and stems apply spray. Two or three sprayings may be necessary in some years; in others none.

Twig Borer. (Polycaon confertus). Cut off twigs and prune.

Fungoid and Bacterial Diseases

Dry Rot or Fruit. Keep trees free from other pests, well pruned out so as to admit light and air.

Olive Knot. A bacterial disease in the form of a woody tumor. Attacks most vigorous trees. Distributed principally by pruning tools. After pruning dip tools in 5 or 6. Cut off all

tumors, removing the entire twig when possible, and burn.

Peacock Leaf Spot. (Cycloconium oleaginum). Fungus on leaves and fruit. Spray with No. 1.

PEACH, NECTARINE AND APRICOT

Insect Pests

Aphis, Black Peach (Aphis persicaeniger). For those above ground use 15 or 20. Destroy the underground forms by pouring carbon bisulphide into holes in the ground (made by a crowbar) six inches to six feet away from the tree and about two feet apart. Pour 20 around base of tree often.

Apricot Scale (Eulecanium armeniacum). Apply 13, 15 or 16 just as soon as the leaves fall. All applications should be made before the first of December.

Black Scale (Saissetia oleae). Same treatment as Apricot Scale.

Borer, Peach Tree (Sanninoidae pacifica Riley). Dig out and kill, or destroy by inserting a flexible wire into their burrows and apply 38-b.

Bud Moth (Lithophane antennata). Use 7 during winter months when tree is dormant. Use 26 just before leaf-buds open and just after blossoms fall. Repeat every ten days if necessary.

San Jose Scale (Aspidiotus perniciosus). Spray with 7 or 17 when trees are dormant.

BEAN POWER SPRAYERS

Powerful Durable Economical Efficient

Nothing has been overlooked that might add to the completeness, sturdiness and downright serviceability of Bean spraying outfits.

Feature after feature has been developed, tested, patented, and incorporated into their construction to make them better. And besides these big outstanding features there are a thousand and one little perfections that put the Bean absolutely in a class by itself.

After all, the only genuine test of a sprayer is actual service—and it is in the field that these many superiorities prove their real worth. "Time out" for broken parts, adjustments, etc., is a rarity. Pump trouble is practically unknown. The reliable little Novo engine does its work with perfect regularity. Of course there are some parts that wear in time, but these can be quickly, cheaply and easily replaced, thus keeping the outfit as good as new for an interminable period.

As a concrete example of Bean leadership take

Bean Pressure Regulator

Until we developed this feature the relief valve on all sprayers was a source of unending trouble. The old-style valve was not only uncertain and unreliable, but even unsafe. It simply could not be depended upon and when the nozzles were shut off the engine and pump worked away at full pressure just the same—at a tremendous waste of fuel and the cause of considerable wear and tear on the outfit.

We have eliminated this relief valve trouble altogether, with the Bean Pressure Regulator. It holds the pressure at exactly the desired gauge—can never fail to operate accurately—and is so constructed that when the nozzles are shut off the engine ceases to work against the pressure and simply pumps the liquid back into the tank, thus effecting a decided saving in fuel and eliminating the wear and tear on the rig that was caused by the old type of valve.

Send for New Catalog

The largest, finest and most complete catalog we have ever issued is now in the hands of the printer. It describes our new outfits and improvements and explains the entire Bean line of Hand Pumps and Power Sprayers (\$100.00 up). Use the coupon.

12 Distinctive Features of the Bean

1. Patented Pressure Regulator.
 2. Patented Threadless Ball Valves.
 3. Porcelain-lined Cylinders.
 4. No Stuffing-Box.
 5. Eccentrics Instead of Cranks.
 6. Underneath Suction.
 7. Bean Quick Re-filler.
 8. Rocking Bolster.
 9. One-piece Steel Frame.
 10. Reliable Novo Engine.
- There are many other features fully explained in our catalog.

After the Harvest

comes the general repair and clean-up work to prepare for the long winter. Lots of time and labor can be saved in this work by using

G-E ELECTRIC MOTORS FOR RANCH AND FARM

A G-E motor will prove ideal in the farm repair shop. It will also turn the grindstone, operate the wood splitter, run the circular saw, the cider press, the hay baler, the corn sheller and many other labor saving devices.

Electricity, wherever available, is the safest, most efficient, convenient and reliable power for the farm. You will never regret the purchase of a sturdy, dependable G-E motor.

Phone 4551

425 Magnolia Ave.
Whittier, Cal.

When writing advertisers, mention The Cultivator.

Twig Borer (*Anarisa lineatella*). Spray with 7 or 9 just when the buds are swelling.

Fungoid and Bacterial Diseases

Blight, Peach (*Coryneum beyerinkii*). Spray last of November or before December 15 with 1-a, 7 or 8.

Curl Leaf (*Exoascus deformans*, Fuckel). Spray thoroughly with 1-a. Later sprayings should be made with 1-b.

Shot-hole Fungus (*Coryneum* sp.). Spray with 1-a about ten days before buds open and with 1-b when fruit is about one-fourth grown.

CHERRIES, PRUNES, PLUMS.

Insect Pests

Cherry Slug (*Caliroa cerasi*). Feed upon the upper surfaces of the leaves exposing the veins. Spray with 26 or dust 32 liberally upon the trees as soon as slugs appear.

Prune Aphis (*Aphis prunifolii*). Spray in the fall with 7, 8, 9 or 11 and as soon as the lice appear with 15 or 20.

Black Peach Aphis (*Aphis persicae-niger* Sm.). See same under Peach.

Peach Root-Borer (*Sanninoidea opal-escens*). See same under Peach.

Canker Worm (*Paleacrita vernata* and *Alsophila pometaria*). See under Apple.

Tent Caterpillar (*Malacosoma dis-tria*). See under Apple.

Brown Day Moth (*Pseudohazis eglanterina*). Attacks particularly the prunes and cherries. Spray with 26 or 27 as soon as larvae appear.

Red Hump (*Schizura concinna*). Spray early with 26. Burn cocoons.

Fungoid and Bacterial Diseases

Brown Rot or Fruit Mold (*Sclerotinia fructigena* Sch.). Produces a rot on the fruit. Spray with 1-a early in the spring, and with 1-b as soon as the buds begin to open.

Leaf Curl or Witches Broom (*Exo-ascus cerasi* Fuckel). Cut out and burn infested parts. Spray with 1-a early, and with 1-b as soon as the buds begin to swell.

Leaf Spot or Shot Hole Disease (*Cylindrosporium padi* Karst). Produces a shot-hole effect upon the leaves. Spray in early spring with 1-a, when the buds begin to open with 1-b, and when the fruit is one-fourth grown with 1-b.

Powdery Mildew (*Podosphaera oxy-canthae* DC.). Appears on the leaves late in the season. Spray as soon as found with 1-b and repeat if neces-sary.

Crown Gall (*Pseudomonas tumefa-ciens* Erw. Smith and Town). If on young trees recently set from nursery, remove and burn. If bearing trees, chisel away until only the healthy wood remains. Paint with 2. Watch for a reappearance and treat as before.

Gummosis. Dig out the gum pock-ets and wash out with 1-a or 2.

NUTS

Insect Pests

Aphis. In winter spray with 7 or 8. For summer spraying use 18, 19 or 20.

Greedy or Walnut Scale. Spray with 7 or 8, when trees are dormant.

Red Spider of Almonds. Spray with 9, using very weak solution, say about one gallon to 33 gallons of water. Also see Peaches.

Fungoid and Bacterial Diseases

Crown Gall. If young trees dig up and burn; if older treat with 2, chisel-ing down to healthy wood and paint with 2.

Dieback. A physical disturbance caused by unnatural soil conditions.

Walnut Blight. Sprays ineffective. The only treatment is prevention by using resistants.

GRAPE

Insect Pests

Grape Phylloxera (*Phylloxera vast-atrx*). Attacks roots and foliage of the vines. Plant resistant stock. Be sure of your nursery stock. When pos-sible long continued flooding of fields is beneficial.

Vine Hopper (*Typhlocyba comes* Say). Infests foliage of the vines. Use hopperdozer in spring before adult females deposit their eggs. Spray as soon as the young begin to appear with 13 or 15.

Grasshoppers. (See under Beans). California Root Worm (*Adoxus ob-scurus* L.). A black beetle whose lar-vae attacks the leaves, stems, petioles,

Stop Losing Money

If your clipper bruises an orange's skin you open the way to decay. The cut may be too small to notice—one decaying orange may spoil an entire box.

You won't bruise fruit if you use

WISS ORANGE CLIPPERS

The blades are specially curved and ground; the points and outer edges are rounded to avoid bruising.

U. S. Government experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they last longest, do best work and save money by minimizing the liability of bruising the fruit.

When writing advertisers, mention the Cultivator.

roots and fruit of the vines. Cultivate deeply around the base of the vines. Spray with 26 as soon as beetles appear.

Flea Beetle (*Haltica carinata* Germ.). It infests the foliage and may be handled by spraying liberally with 26.

Hawk Moth (*Philaenus chemon* Drury). The large green larvae of this moth feed upon the foliage. Hand pick, or if too numerous spray with 26.

Grape Leaf Folder (*Desmia funerals* Hub.). The larvae roll themselves up in the leaves which they eat. Spray with 26.

Erinose (*Eriophyes vitis*). This so-called disease is produced by a small mite, which is characterized by forming swellings upon the upper surfaces of the leaves. Dust plants liberally with 3 when they are wet with dew.

Nematode Root Gall (*Heterodera radicola* Mull.). A minute worm attacking the small roots. Destroy all infested vines. Sterilize soil with 35. Plant only hardy varieties where this exists.

Fungoid and Bacterial Diseases

Powdery Mildew (*Uncinula spiralis* and *Uncinula necator* Schw.) Grows upon the canes, leaves and fruit. Dust often with 3 as soon as the disease appears. Spray early with 1-a.

Downy Mildew (*Peronospora viticola* DB.) Attacks all green portions of the plant—leaves, young shoots, and berries. Spray with 1-b as soon as first appearance.

BLACKBERRIES, RASPBERRIES, LOGANBERRIES, STRAWBERRIES

Insect Pests

Rose Scale (*Aulacaspis rosae* Bouche). A white scale thickly infesting the canes just above the surface of the ground. Spray with 7, 8, 12, 13 or 16.

San Jose Scale (*Aspidiotus perniciosus* Comst.) A small scale badly infesting the canes particularly of the raspberry. Spray with 7, 8 or 11.

Strawberry Plant Louse (*Myzus fragaefolii* Kell.). A light yellow louse attacking the buds, blossoms and young fruit. Spray with 15 or with 20.

Fungoid and Bacterial Diseases

Orange Rust (*Gymnoconia peckiana* Tranz.). Forms orange-red colored masses on the leaves, which finally kill the plant. Dig out and burn all diseased plants as soon as rust first appears.

Leaf Spot on Blackberry and Raspberry (*Septoria rubi* West.). Produces small pale spots on the leaves. Spray with 1-b when leaves are half-grown and repeat every two weeks if necessary.

Leaf Spot of Strawberry (*Mycosphaerella fragariae* Lind.). This disease first appears as small discolored spots upon the leaves which destroy the tissues of the plant. Spray before the flowers open with 1-b. If the disease appears late, mow off and burn the leaves. Spray the newly appearing leaves with 1-b.

Powdery Mildew of the Strawberry (*Sphaerotheca humuli*). Produces a whitish powdery covering on the foliage which soon kills the plant. Dust with 3 when the plants are wet, or spray with 5.

Crown Gall (*Pseudomonas tumefaciens* Erw.). Affects, especially, the blackberry. Dig vines as soon as this trouble appears; there is no cure. Secure new, clean stock and plant on fresh ground.

CURRENTS AND GOOSEBERRIES.

Insect Pests

San Jose Scale (*Aspidiotus perniciosus* Comst.). A small scale infesting the stalks. Spray when dormant with 7, 8 or 11.

Curant Stem Borers (*Sesia tipuliformis* and *Chrysobothris femorata*). Small white larvae which bore into the stalks of the plants. As a preventive, wash plants in the spring with 19.

Imported Curant Worm (*Nematus ventricosus* Klug.). Attacks the leaves in the spring. Dust plants with white hellebore when they are wet, or spray with 32.

Leaf Hopper (*Empoasca albopecta* Walsh). Usually appears in great numbers on the undersides of the

leaves. Spray with 15 as soon as the first ones are noticed.

Curant Leaf Louse (*Aphis ribis*). Usually works upon the ends of the tender shoots and stunts their growth. Spray with 15 or 20.

Fungoid Pests

Leaf Spot (*Septoria ribis* Desm.). Produces large pale spots with brown borders upon the leaves. Spray with 1-b as soon as first spots appear and repeat as often as is necessary to keep down the disease. Spray with 1-b twice after fruit has been removed.

Anthrachnose of Curant (*Pseudopeziza ribis* Kleb.). Produces small brown spots upon the leaves, petioles, young canes, fruit stalks and fruits. Spray with 1-a before leaves appear and with 1-b while leaves are unfolding and repeat every three weeks until fruit ripens.

Gooseberry Mildew (*Sphaerotheca morsuae* B. & C.). Produces a mildew upon the stems, leaves and particularly upon the berries, causing them to spoil. Spray with 1-b just as the buds are breaking open and repeat every 12 days until about July 1. Spray plants in winter with 7, 8 or 11.

PEAS, BEANS, VETCH, CLOVER, ALFALFA

Insect Pests

Alfalfa Weevil. Not yet in California. About the only treatment is dragging the field with brush drag. The fight is still with the California plant quarantine officers.

Wireworms (Various species). Affect beans and many other garden plants. Rotation of crops to starve out the infestations is perhaps the best treatment. Where this cannot be done, the use of carbon bisulphide in sandy ground is advised. Fertilize with nitrate of soda or kainit. Also use 40.

Bean Aphis (*Aphis rumicis* L.) Works on the leaves, young shoots and tender pods causing much damage. It is usually cared for by an internal parasite and by a predaceous ladybird, (*Scymnus sordidus*), but if it becomes too destructive spray with 15 or 20.

Green Pea Aphis (*Nectarophora destructor* Johns). Also attacks vetch, geraniums, malva, and many other plants. Spray with 15 or 20.

Cut Worms (*Peridroma saucia*, *Agrotis ypsilon*). Do great damage to all crops at certain seasons. Plow around field so as to have straight side of furrow next to the crop. Poison with 27 or 28.

Grasshoppers (Various species). Are very difficult to handle. Poisoned baits as given in 27 or 28 have given good results.

Fall plowing of breeding grounds essential.

Bean Weevil (*Acanthoscelides obtectus* Say).

Pea Weevil (*Laric pisorum* L.). Fumigate seed with 35 and be sure that no infested seed is planted. Test by placing in water; infected seeds will float.

Fungoid and Bacterial Diseases

Bean Anthracnose (*Colletotrichum lindemuthianum* B & C.). Produces brown sunken areas upon the pods. It also attacks the young plants. Treat seeds with 6 before planting. Spray with 1-b as soon as young seedlings are well under way. Repeat if necessary. Practice clean cultural methods.

Bean Blight (*Bacillus phaseoli*). Attacks pods and produces wrinkled and distorted seed. Treat seed with 6 before planting.

Rust (*Uromyces appendiculatus* Lev.). Produces rust colored spots on foliage. Spray with 1-b. Burn all infested plants.

Downy Mildew (*Phytophthora phaseoli* Thax.). Turns foliage dark and causes it to wilt and die. Select clean seed. Spray with 1-b.

Downy Mildew of Alfalfa (*Peronospora trifoliorum*). Spray with 1-b or dust with 3.

Pea Mildew (*Erysiphe polygoni* DC). Appears early and late, covering plant with a white felt-like powder. Spray with 1-b or dust with 3.

ONIONS, LEEKS, GARLICS, ETC.

Insect Pests

Onion Thrips (*Thrips tabaci* Lind.). Attack the leaves and flowers causing considerable damage in some locali-

PRINCE ALBERT
GRIMP CUT
LONG BURNING PIPE AND
CIGARETTE TOBACCO

Prince Albert is sold everywhere in toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors and in that fine crystal-glass pound humidor with sponge-moistener top that keeps the tobacco in such first-class trim.

Prince Albert

is such a real smoke!

No matter how long-ago you shut-off on a pipe or stopped rolling cigarettes, you get a few new notions about this Prince Albert tobacco. Because, it is the brand that will hand you a lot of happiness and you will sincerely appreciate its merits. The patented process fixes that—and cuts out the bite and parch.

Prince Albert has revolutionized smoking-satisfaction for thousands of men. It has brought countless pipes back into the sunshine; it will give you more fun than you've had since those hickory-stick-school-days!

PRINCE ALBERT

the national joy smoke

can be smoked all day long, and all evening, without any kind of a come-back but real and true joy. It certainly has the flavor you like best because it is the choice of smokers, not only in the United States, but all over the world! Now, if men of all tastes and all nations say that Prince Albert is right, we are certain it will meet your favor!

Remco Redwood Pipe Tanks

We build to order, for any capacity, TANKS FROM CLEAR AIR-DRIED REDWOOD—THE WOOD EVER-LASTING.

Our tanks are built to exact measurement by the most skilled mechanics.

THEY ARE GUARANTEED ACCURATE IN EVERY PARTICULAR.

Built for All Purposes

They are cheaper than metal tanks and outlast several of them.

WE ALSO BUILD TANK TOWERS.

Remco Redwood Pipe

Is scientifically designed and perfect in manufacture. The smooth interior gives greater carrying capacity.

Design and workmanship give strength.

Redwood gives length of life.

Suitable for Irrigation, Power, Water Supply and Drainage or Sewage Disposal.

HERCULES MFG. CO.
1929 2nd Street
Centerville, Ia., U.S.A.

ties. Spray with 15 as an insecticide and with 1-b as a repellent.

Cutworms. See Beans, Peas, etc.

Fungoid Diseases

Downy Mildew (*Peronospora schlei-deniana* DB). Produces a white mould on the leaves causing them to wilt and die. Spray with 1-b.

Onion Smut (*Urocystis cepulae* Frs.). First appears in the form of dark spots upon the leaves and later as longitudinal rifts upon the bulbs. The following drilled into the soil at the rate of 150 pounds per acre has given good results: lime 50 pounds mixed with sulphur 100 pounds. Also treat seed with 6 as they are being drilled into the soil.

CABBAGE, CAULIFLOWER, KALE, TURNIP, RADISH, MUSTARD

Insect Pests

Harlequin Cabbage Bug (*Murgantia histrionica* Hahn). Attacks all cruciferous plants, cultivated and uncultivated, as well as many other hosts. It is no little difficulty to keep these insects from taking a crop, but by observing the following they may be held in check: keep weeds from the field at all times; plant late trap crops of kale or cabbage and burn them when they become infested, or kill the bugs with pure kerosene. Hand pick adult insects as soon as they first begin to appear. Spray with 15.

Cabbage Aphis (*Aphis brassicae*). Attacks a wide range of cruciferous plants, cultivated and uncultivated. In time, it is subdued by parasitic and predacious enemies, but often not until it has done great damage. It can be controlled by spraying with 15 or 20.

Cabbage Worms (Larvae of *Pieris brassicae*, the Large White Butterfly, and of *Pieris rapae*, the Small White Butterfly). These green worms do great damage by destroying, for market, great quantities of cabbage and cauliflower. The state insectary is at present propagating a very efficient parasite which destroys the chrysalid of this insect. As a repellent apply 32; as an insecticide apply 12.

Cutworms. (See under Beans, Peas, etc.)

Fungoid and Bacterial Diseases

Club Root (*Plasmodiophora brassicae* Wor.). A disease producing a peculiar enlargement of the roots giving the plants an unhealthy appearance and finally causing their death. The disease may be carried over in the soil, so the following has been recommended as a means of control: lime the soil at a rate of 100 bushels per acre, every few years. Rotate crops. Employ clean culture methods.

Black Rot (*Pseudomonas campestris* Smith). A bacterial disease first producing a burnt margin on the leaves and finally causing them to drop. The disease is readily carried from year to year in the seed. Before planting treat the seed with 5 or 6. Eliminate infected plants as soon as they appear in the beds. Rotate crops.

TOMATO, POTATO, EGG-PLANT, TOBACCO, ETC.

Insect Pests

Tomato Worms. (Are the larvae of two *Sphinx* Moths, *Plegethontius quinque-maculata* How. and *Plegethontius sexta* Joh.) These large green caterpillars feed upon the foliage and are easily recognized. Due to their large size, it is very effective to hand pick the infested area. If very numerous spray with 26.

Flee Beetle (*Epitrix parvula* Fab.). A very small beetle which works on the leaflets. As a repellent spray with 1-b; for an insecticide 26.

Twelve Spotted Cucumber Beetle (*Diabrotica soror* Lec.). A small green beetle with 12 black spots on the elytra. The larvae work on a great variety of plants. Spray with 26.

Tobacco Worms:

Cutworms. (See Beans, Peas, etc.)

Fungoid and Bacterial Diseases

Winter Blight or Downy Mildew (*Phytophthora infestans* DB.) Attacks nearly all of the plants of this family, killing the leaves and injuring the tubers. Plant clean seed. Disinfect doubtful seed with 6. Spray plants with 1-a as soon as symptoms first appear.

Root and Stem Rot (*Corticium vagum* var. *solani* Burt.). Causes a "damping-off" of seedlings. Also attacks the tubers of potatoes, the subterranean parts of the tomatoes, and the fruits touching the soil. Apply lime to aerate the soil. Rotate crops.

Dry Rot of Potatoes (*Fusarium oxysporium* Schl.). Wilt of Tomatoes (*Fusarium lycopersici* Sacch.) and Wilt of Egg-Plant (*Fusarium* sp.). All produce a wilt upon the host plants, affect the roots, and may even cause a "damping-off" of seedlings. Treat seed with 6 before planting. Keep weeds out of fields in winter. Rotate crops, so as to have clean soil each year.

Early Blight (*Macrosporium solani* E. & M.). A typical leaf-blight causing brown spots to appear on the foliage. Affects potatoes, tomatoes and daturas. Spray with 1-a when the plants are six inches high and repeat with three applications two weeks apart. Treat seed with 6 before planting. Rotate crops.

Potato Scab (*Oospora scabies* Thax.). Produces large rough blotches on the tubers. This disease cannot be dealt with while the plants are growing. Great care must be exercised in the matter of seed selection. Treat all seed of doubtful origin with 6. Rotate crops so as to keep the soil fresh.

SQUASH, PUMPKINS, CUCUMBERS, MELONS, ETC.

Insect Pests

Melon Aphis (*Aphis gossypii* Glov.). Attacks all parts of the vines and is usually accompanied by a black smut, which grows upon the honey-dew secreted by the louse. Spray with 15 or 20.

Cucumber Beetles, Striped (*Diabrotica vittata* Fab.).

Twelve-spotted (*Diabrotica soror* Lec.). The larvae and adults of these beetles destroy flowers and foliage of the plants and gnaw the rinds of the fruit. Methods of control are as follows:

Repellents—Dust with 31 or with Naphthalene. Soak lumps of gypsum in a mixture of kerosene and turpentine and place them under infested vines. Insecticides—Dust with lime and then spray with 26.

Squash Bug (*Anasa tristis* DG.). Hand pick early in the season; also pick off eggs and destroy. Eggs are deposited in clusters on the leaves when the vines are very young. Trap bugs by laying boards loosely on the ground under which they crawl for protection. If very troublesome a repellent of gypsum saturated with kerosene scattered about the grounds is effective. As soon as crop is harvested, gather and burn vines. Do not allow weeds to grow on the ground during winter months.

Fungoid and Bacterial Diseases

Downy Mildew (*Pseudoperonospora cubensis* Rost.). Disease first appears in the center of the vine and spreads outwardly. Spray with 1-b to which is added one gallon of sulphurous acid to every 100 gallons of spraying material. Repeat every ten days.

Leaf Blight (*Altenaria brassicae nigrescens* Pegl.). Produces spots on the leaves which spread very rapidly. This disease hastens ripening, injures production, and destroys the quality of the fruit. It particularly affects cantaloupes. Destroy affected plants as soon as they first appear. Spray often with 1-b. Rotate crops.

Anthraxnose (*Colletotrichum lagenarium* E. & H.). Forms circular dead spots on the leaves and long shrunken areas on the stems. The fruits of the watermelon are often badly spotted by this disease. Spray with 1-b as soon as fungus appears.

Common Wilt (*Bacillus tracheiphilus* Erw. Sm.). Produces a sudden wilt of the vines by stopping up the water-carrying vessels of the stems. Destroy infected plants as soon as infection appears.

Fusarium Wilt (*Necospora vasinfecta* var. *nivea*). Can be handled only by crop rotation.

Powdery Mildew of the Cucumber (*Erysiphe polygoni* D C.). Attacks other members of this group also. Forms a white powdery coating on the leaves and stems and soon kills the plants. Spray as soon as it first appears with 1-b.

When writing advertisers, mention The Cultivator.

CELERY, CARROTS, PARSNIPS.

Insect Pests

Celery Leaf-tyer (*Phlyctaenia ferrugalis* Hbn.). Destroys foliage, and its presence may be told by the many leaves which are curled and fastened together by this insect. It is particularly bad in greenhouses. Spray with 26 not later than three weeks before marketing crops, because of the danger of poisoning. Hand pick.

Viridescent Leaf-hopper (*Empoasca viridescens* Walsh). Use hopperdozer in large fields or spray as soon as insects first appear with 15.

Cutworms. (See Beans, Peas, etc.)

Fungoid Diseases

Celery Blight, Early Blight (*Cercospora apii* Fr.). Produces spots upon the leaves causing them to turn yellow, to wilt, and finally kills them. This disease also affects parsnips, and usually appears early in the season. Spray early and repeatedly with 1-a.

Late Blight (*Septoria petroselinii* var. *apii* B. & C.). Produces rusty brown spots upon the leaflets which may rapidly spread to cover the entire foliage. Spray with 1-a throughout the season.

ASPARAGUS

Insect Pests

Asparagus Beetle (*Crioceris asparagi* L.). Dust air slaked lime upon the plants when they are wet with dew. Apply 26 dry. As a repellent spray with 32.

Fungoid Diseases

Asparagus Rust (*Puccinia asparagi* DC.). Attacks the bushy tops, producing black and red rust, the latter being the destructive stage. Keep the plants cut back until July 1. Apply 150 to 200 pounds of 21 dry per acre. three weeks after cutting tops and before rust appears. Make the applications in the morning when the plants are wet with dew, or first spray with 1-b.

CORN, SORGHUM

Insect Pests

Corn Worm (*Heliothis armiger*). Is hard to deal with because it works on the ear in the husk. It is best handled by the rotation of crops, late plowing followed by harrowing to destroy the pupae in the soil, and by planting crop as early as possible to assure rapid growth.

Corn Root Aphis (*Aphis maidiradicis* Forbes). Attacks the roots causing a dwarfing of plants in patches over the fields. Crop rotation is the most important method of control. Stir old corn ground thoroughly before planting it again to corn.

Wireworms (See under Beans).

Fungoid Diseases

Smut (*Ustilago zeae* Ung.). Causes enormous enlargements of the kernels, producing large sacs of smut. Cut off and burn the first infestations. Treat seed with 6 before planting. Rotate crops.

Wilt of Sweet Corn (*Pseudomonas stewartii* Erw. Smith). Plants die by wilting due to the shutting off of the water supply. Select resistant stock. Treat seed with 6 before planting. Rotate crops.

Showing how buyers from great distances are seeking California live stock. G. A. Murphy of Perkins reports the sale of Berkshire boar Ruby King, son of Kennett Lee Jr. and Robins Ruby Champion sow to the Kamehameha Schools of Honolulu.

H. S. Kirks, Mahajo Farm, Perkins, Sacramento County, is getting together an exhibit of fine birds for the National Poultry Show at the San Francisco Exhibition, November 18-28. Mr. Kirk has a model plant, running 44 500-egg incubators in season.

Rucker & Coppin of Fair Oaks report sale to Ed. E. Johnson, Turlock, of Duroc boar Dreadnaught for \$225. He was first prize 18 months and under two years boar and headed first prize aged herd at Sacramento State Fair 1914.

Twelve fine Berkshire hogs from the herd of G. A. Murphy, Perkins, Sacramento County, will be shown at the swine show at the Panama-Pacific Exposition and entered for sale at the swine congress sale on November 6.

The Alpha Automatic Power Spray Outfit (Patented)

Fitted with 2 in. or 2½ in. Automatic Duplex or Triplex Pump

Equipped With the New Mechanical Automatic Pressure Governor

The Automatic Pressure Governor Insures Safety, Secures Uniform Pressure and Eliminates Unnecessary Wear. No Relief or Diaphragm Valve Required. Top Guard Rails Fold Up or Can Be Quickly Removed. Gear or Belt Driven. Brass Fitted Throughout.

THE TWO ESSENTIALS in a power sprayer are a thoroughly dependable engine of ample horse power and a positive and reliable pressure regulator that will insure uniform pressure and eliminate unnecessary wear.

THE AVERAGE SPRAY RIG is equipped with a cheap engine and a make-shift pressure relief valve or diaphragm which is exposed to the corrosive action of the spray material which soon puts it out of commission.

THE ALPHA AUTOMATIC PRESSURE GOVERNOR with which the Alpha Spray Outfit is equipped is a simple arrangement of two levers and a spring on each plunger connecting rod which, when the pressure reaches a pre-determined limit, automatically discontinues the operation of the pump without interrupting the driving power, again permitting it to resume operation when the pressure falls below the point at which it has been set.

THIS INSURES SAFETY, secures uniform pressure, and eliminates unnecessary wear (no liquid pumped except it passes through the nozzles), the pressure relief is not dependent on the operation of a sluggish or defective relief valve, but is positive and mechanical, thus making it impossible to run the pressure up to the danger point.

THE POWER PLANT depending on the size rig is either a 2½ H. P. or a 3½ H. P. Alpha Engine equipped with a "built-in", gear-driven, positively timed magneto, requiring no batteries or coil, and is easily started on the magneto without cranking.

CAN YOU AFFORD to own a spray outfit that will balk? When you get ready to spray you have no time to tinker with a defective engine, pump or relief valve, but want an outfit that is capable of a continued high pressure maintenance and one that is thoroughly dependable in every particular.

THE ALPHA AUTOMATIC SPRAY OUTFIT will meet your most exacting demands. The entire frame work is made of channel and angle iron, fitted with a wrought steel bed plate on which the engine and pump are mounted, direct connected with machine-cut steel gears.

BUILT IN ALL SIZES from a 2-inch pump and a 100-gallon tank to a 2½ by 3-inch pump and a 200-gallon tank. (Either duplex or triplex.)

IT WILL PAY YOU to investigate thoroughly the merits of the Alpha Combination Power Sprayer before buying. Send for catalog and prices.

1 Pound of Earth Moved with 0.69 Pounds of Draft

1.45 Pounds of Earth Moved with 1 Pound of Draft

(Report of University of California Experiment Farm)

NOT A PROBLEM, Mr. Farmer—a Solution! A solution of your scraper problem, solved by the Schmeiser Manufacturing Co., of Davis, Cal., and checked by the U. of C. Experimental Farm by actual test on Saturday, Oct. 2, 1915.

The meaning of the above equation is simply this:

The New Schmeiser Wheel Scraper

(built for four horses)

PRICE \$40 F. O. B. DAVIS, CALIF.

requires only 69 hundredths of a pound of pulling energy for each load pound in the scraper. It moves 69-100 of a cubic yard of earth with the same ease as the old-style Fresno moves 53-100 of a cubic yard. A gain in efficiency of 30% (.69 yard—.53 yd.=.16 yd. .16 yd.=30% of .53 yd.)

Why? Because it rolls along smoothly and easily instead of sliding jerkily. It is built on wheels! A labor saver—a profit booster! And the cost is so low that it pays for itself in no time. Stop dragging the life out of your horses with the old-time "Fresno."

Schmeiser Manufacturing Co.

C. A. Cour, Globe Bldg.,
St. Louis, Mo.Entered at the Post Office at Los An-
geles, California, as Second-Class Matter.**Thursday Nov. 4, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**ACKNOWLEDGEMENT**For much help in correcting and
adding to the formulas given in this
issue we acknowledge the assistance
of Prof. E. O. Essig of the state uni-
versity and County Horticultural Com-
missioner Volck of Santa Cruz County.**HELD OVER**When we began planning for
this pest fighting number we wished
every department as complete as pos-
sible though we fully realized the
limitations and the fact that a weekly
paper of this size could not be made
a complete treatise on all the pests
and their control. However, even
then we have asked too liberally of
our contributors and the advertisers
have asked too liberally of us—the
publisher is not writing this—and in
order to maintain entire harmony
some of the very best contributions
have been held over to a later issue.We are very sorry, but honestly
they're worth waiting for.**CITRUS CANKER**We call attention to the request
of Dr. Cook that California unite with
Florida in her efforts to secure fed-
eral aid in her fight against citrus
canker. This is one of the worst pests
that has ever attacked citrus trees.
The only method of eradication is de-
struction of every tree infected. It is
scattered by the lightest wind and may
travel for miles. It is not only in
Florida but in Louisiana and Texas.
California, it is to be hoped, will
always be free from it, but our selfish
interests alone should demand that we
unite with Florida in inducing the fed-
eral department to take up the fight.
When the federal department under-
takes to eradicate a pest, it usually
eradicates it. It has eradicated the
Texas fever tick in many sections;this fight against the citrus canker is
well worthy the best intelligence of
the department of agriculture.**NOT LOST**With the indifference which
seemed to prevail over California, as
shown by one of the lightest votes
ever cast in the state, rural credits,
and every other measure proposed,
went down to defeat, with the excep-
tion of Number four which had to do
with the appointment of judges for the
short term of one month. The lack of
only 7800 votes shows that it was not
an overwhelming defeat. However,
for the present it will be impossible
to secure state legislation giving all
that is desired by those who favor a
safe and sane system of rural credits.
This simply means that the short cam-
paign of education which has been
conducted since the rural credits com-
mission visited Europe will have to be
continued. We say it will have to be
continued, for whether a better rural
credits system is secured through the
exact plan outlined by the defeated
measure or through some other plan,
a more just means of financing agri-
cultural operations must be devised. If
not, stagnation will result. Agricul-to suffocation last Wednesday to hear
reports from Messrs. G. Harold Pow-
ell, manager, and Dana C. King,
orange sales manager, as to their re-
cent trip to the six marketing centers
of the United States. The manage-
ment deemed it wise to better
acquaint the managers of these East-
ern marketing centers, and all other
agents, with California methods of
growing, and especially give informa-
tion as to the quality of our fruits.
This has been done to a degree in
former years, but this year the agents
at various trade centers were asked
to come to the division centers and
regular schools of salesmanship in
citrus fruits were instituted, the man-
agement feeling that this effort would
result in great good to the California
orange industry.Mr. Powell referred frequently to
the kindly feeling of the trade for Cal-
ifornia fruit, yet notwithstanding that,
Florida has many advantages, such as
short haul, labor at one dollar per day
from sunrise to sunset and less dan-
ger of freezing in transit. The com-
ing selling campaign will be one of
the keenest ever conducted in Califor-
nia. The most hopeful feature of next
year's business is the fact that thebut if its efficiency is enough greater,
under certain circumstances it is jus-
tified. We believe these methods will
improve and future years show great
advancement in even this effective
method. The greatest advancement
should be along the line of reduction
of cost. In this machinery will aid.**CITRUS CANKER**A most fatal fungoid malady, sup-
posed to have been introduced from
Japan, is rampant in some of the cit-
rus groves of the Gulf states, but
though very virulent when introduced,
it is as yet not widely distributed. Ex-
tirpation is now possible, but so colos-
sal an undertaking requires and de-
serves governmental aid. The State
Horticultural Society of Florida, that
state and the government have al-
ready enlisted to the extent of thou-
sands of dollars each in this work of
extermination, but more aid is re-
quired, and our government must in
the interests of wise economy come
forward most generously to assist in
this great undertaking. We should
enlist in this conflict, were we indi-
vidually unconcerned, but this is far
from true. California has been well
protected through our superb quaran-
tine and our drastic inspection of all
plants from the Gulf states and the
Orient. When so much is at stake we
must not feel safe if so serious a men-
ace is in any part of our country even
though a continent intervenes be-
tween the infected area and our own
groves. Therefore, in California's in-
terest we must exert every energy to
secure the complete eradication of this
citrus canker from the United States,
even should this require the purchase
and destruction of entire groves. The
seriousness of the situation has led
the state commissioner of horticulture
of California to urge strongly upon our
entire congressional delegation to use
its best endeavor to secure the de-
sirable and sought for legislation. He
also urges associations, exchanges,
chambers of commerce, boards of
trade and individuals of California to
act at once and strongly to secure
federal aid in the extermination of this
most dangerous fungus.—A. J. Cook,
State Commissioner of Horticulture.**THE GARDEN BEAUTIFUL**The Garden Beautiful in California,
a practical manual for all who garden,
by Ernest Brauntton, published by the
Cultivator Publishing Company, Los
Angeles, at \$1.00 postpaid.Mr. Brauntton began writing for the
ornamental garden department of the
California Cultivator some 15 years
ago and we assume our readers feel
somewhat acquainted with him and
his ideas on gardening. His whole life
work has been given to this particu-
lar line and he is fitted to give to
California gardeners just what they
want in information which fits our
local conditions. There have been
more expensive books published on
this subject but we do not think any
which give more specific instruction.
And certainly in consideration of its
price it has wonderful value. Friends
have asked the Cultivator "How can
you do it at such a price?" There are
208 pages in the book and 14 full half-
tone plates, together with many text
figures. There are 13 chapters touch-
ing upon planning the place, lawns
and soil covers, trees and shrubs,
climbers and trailers, rockeries and
feneries, annuals and perennials,
water gardens, house and porch
plants, bulbs and tubers, roses, chry-
santhemums, pests and diseases, and
perhaps best is a garden calendar
touching upon gardening operations
for each month of the year. The
glossary is of value for it explains
many of the hard-to-understand words
used in floriculture. We feel that
every subscriber of the Cultivator
should add this book to his library. It
will be sent post paid to cash in ad-
vance subscribers for \$1.75, including
a year's subscription.HILE the formulas given are thoroughly dependable and at
times of great value to many, it must be borne in mind that
many of our largest and best orchardists find satisfaction and
profit as well from using the commercially prepared articles.
The Bordeaux, lime-sulphur and other washes for instance as
now prepared are so thoroughly dependable that we feel justified in urging
their use, both on the grounds of economy and efficiency.ture in this state has suffered greatly
during the past few years, but for-
tunately the spirit of the West pre-
vails, and some step, we believe,
which will give definite relief, will be
taken in the near future.**REDUCE THE PESTS**The grower who takes delight
in the fact that he has to fight pests
because if he did not he would have
so many neighbors growing the same
fruits he does that the world could not
consume the production, has but few
who believe with him. There is a
measure of truth in what he says, but
most of us feel that Dame Nature has
been rather unkind to us in favoring
the vast hordes of animal life which
prey upon man, or at least upon the
crops which he is endeavoring to pro-
duce. It seems that every sort of
bacterium, fungus, insect and four-
footed pest stands ready to nullify our
effort. Not only that, but weather con-
ditions are against us. If it isn't hot,
it's cold; if it isn't wet, it's dry. But
since the mistake made in the Garden
of Eden it has been necessary for us
to earn our bread in the sweat of our
brow. The pests were here before we
began raising oranges and olives,
pears and persimmons and all the
other products of the earth, and we
must fit ourselves to dispute with
them the right of way. This week's
Cultivator is given over almost entire-
ly to discussing some of these pests
and methods of controlling them. It
would be foolish to attempt descrip-
tion of all or to give methods for con-
trolling all, within the scope of such
a paper, but we hope this edition will
prove of value to many a farmer, and
to that end it should be laid on a con-
venient shelf for future reference.**MARKETING**The assembly room of the board
of directors of the California Fruit
Growers' Exchange was packed almosttrademark "Sunkist" is synonymous
with the word "orange," and when the
trademark is mentioned California
oranges are at once spoken of.**FUMIGATION**The greater number of the pests
affecting agriculture may be con-
trolled, or at least their worst depre-
dations avoided by seasons of planting,
by the use of resistant stocks, by poi-
soning, spraying, dusting or fumigat-
ing. Probably the one invention which
has most benefited the fruit grower is
the spraying machine and it has
been vastly improved during the
past few years. There is scarce-
ly one of the deciduous fruit crops
but it is necessary to bring to
their help sprays and modern spray
machinery. It is only a very few years
since the most efficient spray pump
was run by man power. If man power
only were available today in spraying
operations there would be a great im-
petus given to the labor market. But
the little gasoline engine is working
wonders and reducing the cost of the
work. There are occasions, however,
where the most improved spraying
machinery is, if not ineffective, at
least not so efficient in its operation
as the gas tent. With the citrus tree
always in foliage, likewise the olive
and many others, it is almost impos-
sible for sprays to reach all parts of
the tree.A third of a century ago orange
growers began to dream of a more
effective method. It had to come or
the orange industry would languish. It
came in the form of hydrocyanic acid
gas treatment. There were trees
killed; there was poor work done; but
ultimately a very satisfactory method
was developed. Only the last two
years has seen great improvement in
this modern method of insect control
and the exactness of machinery is now
entering as the big factor. It is neces-
sarily more expensive than spraying,

Agricultural News Notes

of the Pacific Coast

Northern California

Marysville's week of rice carnival came to a successful close Saturday night.

Palermo, Butte County, shipped two carloads of oranges to New Zealand on October 14.

Leonard Prisk has been declared the champion potato grower of the Grass Valley high school agricultural club.

Ducks are reported as doing thousands of dollars of damage to rice crops in the Colusa section of Glenn County.

W. L. Hobbs of Yreka, Siskiyou County, has sold a 1000-acre dairy and stock ranch near Edgewood to Alves and Santos.

Butte County olive growers are ready for the harvesting season. Picking will commence early in November. The yield is estimated at normal.

Experiments carried on by Prof. Gordon H. True of the state agricultural college have determined that almond hulls have practically no feeding value for sheep and swine. The gains heretofore reported on swine fed on almond hulls are therefore concluded to be really due to meats left in the hulls as usually fed.

Central California

Harvesting has begun in the rice fields at Kerman.

The Visalia canneries are sending out two carloads of canned fruit daily to the Eastern market.

The Tagus Ranch, north of Tulare, secured 38 head of pure bred Holsteins at the recent Holstein sale at Hanford.

A number of raisin growers of Kingsburg, Fresno County, have signed up with the Associated Raisin Company.

The Tulare Cooperative Poultry Association reports a substantial gain in business during September, 1915, over September, 1914.

Salinas sent eight boy contestants in its bean growing contest to the agricultural club convention at the Davis university farm.

The Mountain View branch of the Stanislaus County farm bureau held a general social and get-together meeting the night of October 16.

The Tulare Cooperative Poultry Association is talking of holding a show sometime in December or January. Local poultrymen are evincing considerable interest in the proposed show.

Southern California

Several different plans are being discussed for an organization of bean men of Southern California.

The Almond Growers' Association of Banning has shipped out over 100 tons of nuts, with about 75 tons yet to go.

The San Bernardino County Poultry Association has been organized. F. H. Bean of Colton has been made secretary.

Serious fires have been burning in the San Timoteo and Live Oak canyons in San Bernardino County. Much grain land was also burned over.

"The Proof of the Pudding" is the title of a booklet being issued by the Sixth National Orange Show, containing expressions of appreciation by exhibitors and business men of the benefits of the 1915 show.

Ranchers of Hesperia in San Bernardino County requested permission of the county supervisors to establish a pound district in which straying stock could be confined, but the district attorney's office has decided that as all the cattle are branded, and therefore the owners known, there are practically no "estrays" in the meaning of the law.

The Coast

Dona Ana County, New Mexico, has a newly appointed farm adviser.

Gilbert, Yavapai County, Arizona, is assured of a new \$15,000 alfalfa mill.

Arizona poultrymen are planning for a big show at Tucson December 18-20.

The state of New Mexico recently sold over 80,000 acres of grazing land to cattlemen.

The Arizona Cattle Growers' Association will hold its annual convention at Prescott, January 15-17.

The premium list is now being mailed for the annual Pima Indian Fair, to be held at Sacaton, Arizona, November 3-5.

The annual show of the Arizona State Poultry Association will be held at Tucson, December 16, 17, 18. The secretary is B. F. White, Tucson.

A rancher in the Artesia district of New Mexico catches grasshoppers in a hopperdozer, dries them in the sun, and saves them for winter feed for his chickens.

The board of directors of the Wenatchee, Washington, reclamation district has organized and elected officers and is now preparing estimates for improvement work.

Pear Blight Treatment

Written for California Cultivator by Percy L. Gammon, Giving Methods as Practiced in Sacramento County

HE time is at hand when your pear blight can be most successfully eradicated. To do this work a trained man is absolutely essential. If none are available, send a young, energetic and methodical employe, one who has your interest at heart, for a week's training with some authority on blight. A month would be better.

Supply him with the proper tools and see that he is unhurried and unharrassed by your own interference into the efficacy of, for instance cutting this tree down or cutting so much away from that tree. He must be, however, versed in the right way of making good clean workman-like cuts, being careful not to leave snags or stumps. The success of your treatment depends solely upon the knowledge and personality of your blight cutter. Half way methods are worse than useless, and a careless, slovenly worker may do much more harm than good.

Just before the leaves fall and before the first frost is the time to inspect the foliage for a reddish color which indicates either diseased or injured areas in the limbs, trunks, or roots. Mark these as suspicious characters, as they may or may not be caused from blight, but in many cases are the surface indications. These should receive especial attention.

When you look the trees over also cut out with a long handled pruning hook all traces of twig blight.

As soon as the trees become dormant start your large limb, trunk, crown and crown union inspection. This inspection is carried on by gouging at least every four inches, being

careful to disinfect your tool and your cut surface after every cut. Every pear tree in your orchard should be gone over in this manner.

The disinfectant best suited for this purpose is bichloride of mercury, 1-500 solution. Get the tablets in thousand lots from any druggist. Carry the solution in a two gallon composition bucket. Metal or wooden buckets neutralize the disinfectant. Apply with sponges and use at every cut and every opportunity.

Cut away all diseased portions where found, scrape all diseased surfaces with a scraper and keep edges perpendicular so as to promote as much as possible the growth of healing tissue. Disinfect every cut. The tools necessary to this work are as follows: One three-quarter inch gouge, one half inch gouge, one one inch gouge, one one inch chisel, one three-quarter inch chisel, two large scrapers, one small scraper, one shovel, one hand axe, one large axe, one pair two-handed pruning shears, one long handled pruning hook, saw, bucket and sponges.

To prevent decay paint four times a year with white lead and linseed oil. The spring and summer treatment is more generally understood, so I will not dwell on it here. I will, however, give one warning: Keep your suckers down throughout the entire year. If you cannot do this and keep your blight down with one man, keep more, and keep them all the time. That is the only way in which you may fully succeed. Half way measures are futile.

tention was first called to the probable need of regular spraying against this fungous enemy. Soon after Dr. Woods had made this observation California received a visit from Professor P. H. Rolphs, director of the Florida agricultural experiment station, who had first investigated wither-tip fungus in the citrus orchards of Florida in the early nineties and since that time had had continuous practical experience in its control by artificial means. Spraying with Bordeaux mixture had been found by Florida growers the most effective measure against it. This was the remedy and preventive advised by Professor Rolphs.

Doubtless most citrus growers know that Bordeaux mixture is a spray made of copper sulphate, commonly termed "bluestone", good dry barrel lime and water, the traditional standard mixture containing six pounds copper sulphate, six pounds lime and 50 gallons water.

For citrus spraying Professor Rolphs recommended as sufficient, instead of the 6 6-50 formula given above, a 4 4-50 or 3 3-50 mixture. The acreage sprayed for wither-tip control in 1909 and even up to the present time has been confined quite largely to lemon acreage in the near-coast regions where the more humid atmosphere furnishes more favorable conditions for fungus growth. The writer's experience has been exclusively with lemons.

In comparison with both home made and commercial lime-sulphur sprays, and with an ammoniacal solution of copper carbonate, the 4 4-50 Bordeaux proved more effective in preventing the characteristic wither-tip spotting of the lemons. To be most effective, however, all of these sprays, as experience has shown, must be applied as late as possible in the fall, but in advance of the principal rainy season. October and November are probably the best months, one year with another.

The subsequent discovery that trees and fruit sprayed with Bordeaux were extremely sensitive to the burning action of hydrocyanic acid gas, so widely and frequently used for fumigation, made the use of this spray extremely hazardous. The growing necessity for control measures against the red spider called for a sulphur spray. Though generally considered somewhat inferior to Bordeaux the sulphur sprays have been widely used for many years in the summer spraying of deciduous orchards for fungus control. Experiments demonstrated that fumigation could follow safely within

a few days, or weeks at the most, a thorough spraying with the lime-sulphur solutions. Consequently, serving a double purpose as it does, the lime-sulphur has almost entirely displaced the Bordeaux as a remedy against wither-tip.

But the Bordeaux still has its place in the lemon orchard, leading all known fungicides in the fight against the common "brown-rot" decay of the fruit and the "brown-rot" gummosis of the tree trunk. In 1912 Professor H. S. Fawcett, then pathologist for the state commission of horticulture, made that most valuable discovery that practically all of the gum disease of the lemon tree is caused by the brown-rot fungus. For this he suggested the use of Bordeaux paste on the trunks affected, applying it with a brush after cutting out the diseased areas, and also as a preventive on trees not already infected, but apparently in danger of infection. The usual formula for this paste is as follows: One pound copper sulphate, two pounds lime, one and one-half to two gallons water.

Coincident with this discovery came the idea of spraying with Bordeaux the trunks of the trees, the ground beneath them, and the low-hanging boughs, so that every part of the tree within two feet of the ground might be as nearly as possible immune against brown-rot infection. While apparently commercially controlling the wither-tip yet the lime-sulphur sprays have conspicuously failed to hold in check the brown-rot in the orchard and prevent the infection of fruit hanging on the tree near the ground or in contact with it. For this purpose the Bordeaux is indispensable. Such spraying, however, should never be done until just after a fumigation or a year ahead of one, so that as long a time as possible may elapse before another fumigation. Thus far experience seems to show that if a full rainy season follows this ground spraying there is small likelihood of its seriously affecting the trees when fumigated the following summer or fall.

As the citrus orchards advance in age, shading more and more of the soil, keeping it wet in winter and preventing the growth of vegetation, it seems quite likely that brown-rot will become more and more destructive of both trees and fruit, unless preventive measures are carefully practiced. Bordeaux spray, used only on the ground and lower two feet of the tree, and the Bordeaux paste are the surest and safest preventives known and proven at the present time.

Fungicides at Limoniera

By Jas. D. Culbertson, Assistant Manager Limoniera

N California the year 1909 marked the real beginning of commercial spraying of citrus orchards for fungus control. A little desultory and experimental work had been done

previously, but it was following the discovery and identification of the "wither-tip" fungus by Dr. A. F. Woods, then of the United States department of agriculture, in the spring of 1909, that the citrus grower's at-

DE LAVAL SEPARATORS

Make Fall and Winter Dairying More Profitable

THERE are special advantages in using a good cream separator during the fall and winter months. The milk from cows long in lactation is hardest to cream, and likewise hardest to separate with an inferior separator.

Moreover, cream and butter prices are highest, so that the waste of gravity setting or a poor separator counts for most.

Then there's the sweet, warm skim-milk for stock feeding, alone worth the cost of a separator in cold weather.

There is surely no reason to delay the purchase of a separator or to continue the use of an inferior one.

You can't afford to wait until next spring. Let the De Laval start saving cream for you right now and it will earn its cost by spring. See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

LOUDEN

BOOK OF BARN PLANS FREE

If You Intend to Build a New Barn or Remodel an Old One You Should Have This Book

Louden Barn Plans is not a catalog of barn equipment. It is a complete and valuable book of reference and instruction on barn construction.

The 96 pages of Louden Barn Plans are full of dollar-saving information. It contains 51 representative designs for cow barns, horse barns, combination and general purpose barns, as well as many other designs for hog barns, pens, bay sheds, chicken houses, etc.

In addition to the barn plans shown in the book, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.

When Writing for This Book Please State When You Expect to Build, and How Many Cows and Horses You Want to House

We have designs for nearly 4,000 barns, and our architects will give your letter personal attention if we learn your exact requirements.

Louden Barn Equipment

Louden equipment makes possible a clean, sanitary barn with a minimum of expense. When cows are transferred from dark, dirty barns to Louden barns the milk flow often increases from 15 to 25 per cent, and the labor of caring for the herd is reduced from one-third to one-half. Louden equipment is just as great economy for the man with a half dozen head of stock as for the man with hundreds of animals. The percentage of labor saved is the same.

The Louden Line of Sanitary Steel Equipment Includes:

Litter Carriers	Cow Stalls	Hay Loft Equipment	Sheep Pens
Feed Carriers	Horse Stalls	Cow Pens	Water Basins
Milk Can Carriers	Mangers	Calf Pens	Bird Proof Barn Door
Harness Carriers	Manger Divisions	Bull Pens	Hangers
Hay Carriers	Feed Racks	Hog Pens	Power Hoists and
Feed Trucks			Other Barn Specialties

Sanitary Barn

Cleanliness as a Preventive of Disease. Methods of Treating Some of the More Common Pests Affecting Stock.

TOO many barns are maintained in unsanitary condition. This may be partly the fault of construction, but it is more generally the fault of the farmer. The health of live stock depends upon right conditions to almost as great an extent as does the health of the family upon ventilation and proper sanitation in the house. We have visited barns which were so strong with the fumes of ammonia when the doors were opened in the morning that it seemed strange the eyes of the stock were not blinded. Of course such a condition is the result of negligence in the continual piling up of manure which has partially decayed and set up formation of ammonia. Such conditions should be corrected by cleanliness and the use of disinfectants or absorbents. The farmer who is saving his stable manure—and he is a poor one if he is not—may well afford to purchase rock phosphate, gypsum or some other absorbent which not only gives his stock more healthful surroundings, but furnishes for his trees the richest of fertility.

Again, many permit the infestation of live stock with mites or vermin of various kinds. This is even more deplorable than the unsanitary condition mentioned, for even the best of dairy cows cannot fill the milk pail and feed blood-thirsty insects all over the body. Still worse, these insects often carry disease from one animal to another. Eliminate dust, use the spray pump freely, apply kerosene emulsion and whitewash all the interior of the stables. If in addition there are cement floors with gutters the live stock should be kept in excellent condition.

Of course most important of all is the keeping down of the pest of flies, for the sake of humans as well as stock. Take all manure directly to the orchard or field and if possible plow under. Where necessary to store keep in fly-proof bins or boxes. As a repellent use a mixture of fish oil one gallon, oil of pine tar two ounces, oil of pennyroyal two ounces, kerosene one-half pint. Apply as a spray to the animals.

Ox Warble

For partial control of this pest the legs of the animals may be kept treated with the fly repellent given above. Be sure and squeeze all grubs from the backs of the animals in midwinter. Some prefer the injection of kerosene, carbolic acid or turpentine through the small opening in the back.

Texas Fever Tick

To control the Texas fever tick the usual dipping methods are resorted to. Arsenical dips have been found most efficient. For a vat holding 1500 gallons, use 74 pounds sal soda, 24 pounds white arsenic (99 per cent arsenic trioxide), and three gallons pine tar. The reader is referred to Circular 183, bureau of animal industry, department of agriculture, Washington, for specific directions, or apply directly to the state veterinarian for assistance.

Swine Parasites

Creolin dips at from three to four per cent are strongly recommended. Repeat in ten days.

Lime sulphur dips are especially recommended, i.e., in the proportion of eight pounds of lime and 24 pounds of sulphur to every 100 gallons of soft water. The dip must be used warm, and in severe cases should be rubbed in thoroughly by hand.

Sheep Dip

The two principal dips used against scab are tobacco and lime and sulphur. It has been found by careful experimentation at the Kentucky agricultural experiment station that there is no advantage in adding sulphur to tobacco dips. The per cent of nicotine in the dip should be from 0.05 per cent to 0.07 per cent. The proportion of the ingredients used in the lime-and-sulphur dips varies somewhat according to the severity of the disease, i.e., flowers of sulphur 24 to 33 pounds, unslaked lime from eight to 11 pounds to 100 gallons of water.

Lice

Lice are as a rule quite easily killed by an application of a two per cent to three per cent solution of creolin or other standard proprietary remedy used as directed.

Four-Footed Pests

Coyotes, Gophers, Rabbits and Other Pests Almost Innumerable Contend With the Farmer for Every Crop. Methods of Control. Written for California Cultivator.

THE greatest loss to California farmers from depredations of four-footed pests comes from the common California ground squirrel. It is estimated that it costs the state yearly millions of dollars. There is a state law which makes it a misdemeanor to harbor these pests; it should be enforced more rigidly.

The best remedy is carbon bisulphide used in an instrument called the squirrel destructor. This was patented by officials of the United States department of agriculture and the patent dedicated to the use of the public. It consists of a receptacle holding the fluid, with a measuring device which the operator can set so as to give proper amount for every hole. The tube is conducted into the hole, the gas injected and the hole instantly stopped up. Twice over the field eradicates practically 100 per cent. The best season for work is after the rains have soaked the soil so as to hold the gas.

The best poison is probably that recommended by the hospital marine service which has made a campaign to eradicate this pest in the counties

about San Francisco Bay—this because it was found that some of the squirrels were infested with ticks carrying the germ of the bubonic plague.

Government Formula for Poisoned Grain for Squirrels

This formula is said to be 85 to 90 per cent efficient if applied four or five times at ten-day intervals during the season.

Whole barley (recleaned).....18 pounds
Strychnine sulphate.....1 ounce
Soda (bicarbonate).....1 ounce
Saccharine.....1 dram
Thin starch paste (laundry starch).....1 pint
Corn syrup (Karo or equal) 2 ounces

Dissolve the strychnine in hot water; thicken with starch to about the consistency of soup. Dissolve the soda in one-half pint of hot water and add a little at a time to the poisoned starch until effervescence stops, then add the syrup and saccharine, mix well and apply to the grain, stirring constantly until the poison is evenly distributed throughout.

Remember strychnine is a deadly

CALIFORNIA AND THE JERSEYS

Editorial Correspondence

"California should be a Jersey paradise." This is a statement made during the Panama-Pacific International Exposition Cattle Show by no less an authority than the capable and energetic president of the American Jersey Cattle Club.

It is a statement that means much to the live stock industry of the state. Progress and extension are watch words in the "Jersey Camp" now.

For years the American Jersey Cattle Club has been controlled by conservative, wealthy breeders who have, to say the least, had less interest in the popularizing of the breed than have those in control of some of our other breed societies. The value of the Jersey as a capable, honest producer of dairy products on the farms of hundreds and thousands of dairy farmers in moderate circumstances has not been given the attention and publicity that has been given similar facts about other breeds.

Now those who are most interested in the progress of the breed believe that an increase in the number of breeders among the dairymen all over the country and their enrollment as members of the club warrants the effort necessary to bring about this result.

We produce wonderful Jersey cattle in California. We have a combination of peculiarly favorable feed and climatic conditions that makes it possible to grow animals of great vigor and vitality, profitable dairy animals that will make big money for their owners.

And if the American Jersey Cattle Club decides to conduct a campaign to further popularize the Jersey in California great results should attend the effort.

CALIFORNIA CREAMERY OPERATORS

Written for California Cultivator

The State Creamery Operators' Association closed what every attendant stated was by far the most successful convention yet held in California last Saturday night at a banquet held at Inside Inn, Exposition grounds, San Francisco. The attendance was large and an excellent spirit prevailed at every session. The program which was given in a former Cultivator was followed to the letter, which was a satisfaction to those who came for certain features at a certain time.

One of the pleasant features of the banquet was the presenting to butter scoring contest winners the various special prizes won. Details of the contest and list of winners will be given in the next Cultivator.

There was discussion as to law enforcement and methods of securing more hearty cooperation between inspectors, dairymen and creamerymen.

The state dairy bureau is unable to employ sufficient inspectors to cover the state more than once a year, so that in some sections the dairymen become lax as to cleanliness and as to condition of cream delivered. Tulare County has an inspector under county employment and he is securing cooperation on the part of most dairymen and creamerymen.

Many valuable suggestions were made by Mr. John Sollie, one of the judges of the butter scoring contest. He was not agreed with entirely in one point—that the maximum acidity of cream at time of churning should not exceed .35 per cent. Many creamerymen felt that the flavor of butter from such cream would not be received by the trade as well as from a cream testing at least a half of one per cent.

The next annual meeting will be held at Ferndale, and a movement was started at the banquet to make it a great meeting. Many hearty commendations were given to retiring President W. H. Roussel and his committee and to Secretary Davis for the plans for the most successful convention.

Officers for the new year are president, H. F. Harbers of the convention town, Ferndale; vice president, W. P. Hopkins, Petaluma; secretary, Prof. Leon M. Davis of University Farm, Davis; executive committee, C. E. Gray, T. J. Harris and H. S. Baird.

LOUDON

STALLS and STANCHIONS

The Clean-Cut Simplicity of the Loudon Stalls and Stanchions in design and construction; their absolute freedom from dirt-gathering cracks, crevices, corners or attachments, make them the only really sanitary barn equipment.

The Superior Flexibility of the Loudon Stanchion permits the cow to lie down or rise without the dangerous straining common to the more rigid type. The Loudon Stanchion (all steel or wood-lined) is an absolutely safe and comfortable stanchion.

Loudon Stalls and Stanchions are built of the finest, high-carbon tubular steel and are exceptionally strong, easily installed and cost no more than wood.

We also manufacture Feed and Litter Carriers, Spring-balanced Mangers and Manger Partitions, Bird-proof Barn Door Hangers, Hay Tools, Power Hoists; Calf, Bull, Cow and Pig Pens, Window Ventilators, Etc.

Write us for Free Illustrated Catalogs. We can plan your barn. Our experts will give you FREE sketches. Write us.

A Guaranteed Worm Expeller

GILBERT HESS, M.D., D.V.S.

Worms are responsible for nine-tenths of your hog troubles at all seasons of the year, but especially in the fall. Do not be misled, thinking your hogs have some other ailment. Nine times out of ten their trouble is worms. My Stock Tonic will positively expel these worms and keep your hogs in a healthy condition, thereby enabling them to resist disease and lay on fat. Feed my Stock Tonic to your hogs right now.

Dr. Hess Stock Tonic

Makes Stock Healthy—Expels Worms

25-lb. pail, \$2.25; 100-lb. sack, \$7.00

Why pay the peddler twice my price?

It isn't enough to rid your hogs of worms, mark you. You must also tone them up and put them in such a clean, vigorous condition as to make worm development impossible. That is why my Stock Tonic not only contains vermifuges to expel the worms, but it also has in it tonics, blood builders and laxatives to build up and regulate the animal's system.

My Tonic is highly concentrated, as the small dose quantity will prove, and as I have no horses, wagons and salesmen to pay for, I can sell you at rock-bottom prices through your local dealer.

My Stock Tonic also aids digestion and assimilation, makes your hogs and other stock thrive; it is the result of knowledge which I have acquired as a veterinarian, doctor of medicine and stock raiser. Formula on every package.

So sure am I that Dr. Hess Stock Tonic will keep your stock healthy and expel worms, that I have authorized my dealer in your town to supply you with enough Tonic for all your stock and, if it does not do all I claim, just return the empty packages and get your money back.

25-lb. pail, \$2.25; 100-lb. sack, \$7.00, smaller packages as low as 50c. Send for my free book that tells all about Dr. Hess Stock Tonic.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-cé-a

A splendid tonic during the moulting period. It gives the moulting hen vitality to force out the old quills, grow new feathers and get back on the job laying eggs all winter. It tones up the dormant egg organs and makes hens lay. Also starts the pullets to laying. Economical to use—a penny's worth is enough for 30 fowl per day. 14 lbs. 25c; 3 lbs. 50c; 7 lbs. \$1.00; 25-lb. pail, \$3.00. Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks and dust bath. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 50c. I guarantee it.

If you have a sick or injured animal, write me, giving symptoms, and I will send you prescription and letter of advice free of charge. Send 2c stamp for reply.

The Big Money Power Behind Your Herd

INCREASED PROFITS through an increased herd is one of the first results of installing the Empire Milker. Once you get rid of the hard job of milking—and see how easily you can milk more cows in less time and at less expense—you will increase your dairy business just as the grain farmer increased his acreage when he threw away the cradle for the reaper.

EMPIRE Mechanical Milker for Large or Small Dairies

works by natural air pressure—not compressed air. Operate by any power. Collapsing and expanding of soft lining in teat cups coaxes the cow to let down milk easily. Cows stand quietly and yield more milk. The Empire Milker is now used in thousands of successful dairies all over the country. Let us refer you to owners and tell you how easily you can install it and make it pay. Address

SHEEP AND GOATS AT THE EXPOSITION

California is a great sheep state but
it is not apparent from the entries at
the exposition this week for nearly all
the entries are made from outside the
state. Great attention is attracted
by a fine exhibit of Romneys from
New Zealand. The Rambouilletts top
the list as to numbers with 209. Other
breeds number: Hampshire, 57; Cotswold, 59; Oxford, 12; Dorset, 14; Southdown, 21; Romney Marsh, 33; Corriedales, 62; Persian Fattails, two groups; Karakules, one group.

Goats

Angora goats, 87; Toggenberg milch
goats, 23.

GREATEST EXHIBIT OF BERK- SHIRES

Berkshire swine outclass everything
at the swine exhibit now being made
at the exposition. It is pronounced
the finest and biggest exhibit of Berk-
shires ever made. There are 294 single
entries besides many groups;
other swine classes are generally
large. They number as follows—all
figures are as to single entries. In
each there are group exhibits as well:
Poland Chinas, 143; Duroc Jerseys,
106; O. I. C., 13; Hampshires, 93;
large Yorksires, 14; Essex, no single
entry but several groups.

At this writing, Monday, all stock
not placed but sufficient are in pens
to indicate a great show.

RED POLLED PRIZE WINNERS

In last week's leader article, "Pana-
ma-Pacific Cattle Show Winners",
mention of Red Polled cattle was by
error placed under "Holsteins". This
paragraph should have appeared
under "Red Polled Cattle" on the first
page of the article on which was
shown photograph of prize winning
Red Polled cow exhibited by Mr. Cart-
wright: "R. R. Cartwright of Angels
Camp had a popular prize winner in
the beautiful cow that is illustrated
and won many other prizes. His cat-
tle were not as highly fitted as were
those of the F. H. Porter herd from
Halsey, Oregon, who had many at the
head of the list."

SEE THE MOVIES

One of the most educational fea-
tures of the exposition is given by the
use of moving pictures. Many manu-
facturers show the processes of their
factories, the government is using
them in explaining mining and other
operations, and at almost every turn
there is an opportunity to rest and
be instructed. In this respect the ex-
hibits are very educational, for the
movies are worthy of something better
than cowboy stunts. As one has ex-
pressed it, "If one sees nothing else
at the exposition but the movies he
has gained a fair insight into what the
world is doing."

AUCTION 54 Horses and Mules

Implements, Etc.

4 Miles North of Capistrano

AT GALIVAN. TAKE SANTA FE MORNING TRAIN TO GALIVAN, CON-
VEYANCES IN WAITING MORNING OF SALE. AUTOS TAKE SAN
DIEGO ROAD TO GALIVAN AND TURN EAST 1 1/2 MILES.

MONDAY NOV. 8 At 10:00 A. M.

The owners have instructed us to dispose on above date to highest bidders
POSITIVELY WITHOUT LIMIT OR RESERVE the following described stock
and implements:

Twenty extra good mules, 3 to 9 years old, weights from 1100 to 1400
pounds each, sound and in good condition and as fine a lot of young mules as
can be found.

Thirty heavy horses and mares, 4 to 9 years old, weights from 1200 to 1500
pounds each, sound and in fine condition. There are a number of matched
spans of both horses and mules in this sale, and buyers looking for extra good,
clean ranch stock should attend.

One team of driving horses, weights about 900 pounds, 5 years old and well
matched.

Two good saddle horses.
Implements: 18 sets of good double harness, 7 farm wagons, header beds,
spring wagons, three 6-gang plows, one 4-gang plow, one 3-disc plow, McCor-
mick mowers, rakes, steel harrows, disc harrows, Cyclones, spring tooth har-
rows, cultivators, sidehill harvester with attachments to thresh beans or grain,
2 gasoline engines, 2 1/2 horse and 1 1/2 h.p., lots of good lumber and roofing,
water tank, tank wagon, complete blacksmith outfit with assorted tools,
pipe, etc.

Terms—\$100 and under cash, over \$100 a credit of nine months with note
and approved security and 8 per cent interest. Five per cent discount for cash
on time sums.

If you are in the market for first class stock and implements don't miss this
genuine closing out sale. Free lunch at noon.
No outside stock will be offered at this sale.

GOOD DISINFECTANT

The great live stock show being held
at the Panama-Pacific Exposition is
thoroughly disinfected with Parke-Davis
& Co.'s Kresol. This work and the ex-
hibit of this company is in charge of S. S.
Dougherty, who is handling the situation
very capably.

Poultry Yard Pests

Written for California Cultivator by Jean A. Koethen.
Profit and Pests Cannot be Produced in
the Same Yard

NE of the most difficult prob-
lems of the California poul-
tryman is the keeping of his
birds and houses free from
lice, mites, ticks and fleas.

All these pests multiply rapidly in
warm weather and must be fought con-
stantly and persistently.

Lice

Lice, like the poor, are always with
us. Leghorns and other Mediterran-
ean breeds, often keep themselves
fairly clean without attention and can
be kept clean with two or three good
dustings yearly, but the fat, lazy hen
of the heavy breeds is rarely without
them unless she is regularly treated.
Dusting is the method most generally
employed in ridding hens of these
pests. A cheap powder is made by
mixing three parts gasoline with one
part crude carbolic acid or cresol and
adding gradually, while stirring, enough
plaster of paris to take up all the
moisture, which is generally about
four quarts plaster of paris to one
quart of the liquid. A dry, pinkish-
brown powder will result and may be
put through a sieve if lumpy. Work
this well into the feathers, especially
about the vent, as often as lice are
found. To avoid wasting the powder
hold the bird over a box or paper. On
some ranches a special dusting box is
kept for this purpose.

The dust box filled with road dust
or road dust mixed with lice powder
has gone out of fashion because the
birds declined to use it. Instead a
dusting hole of moist earth in the soil
of the run is recommended. Many birds
keep themselves fairly clean if they
have such a dust hole in a shady place.

Dipping the birds in sheep dip or
coal-tar preparations, while it is some-
times practiced, is out of the question
when a large number of birds are to
be treated and is only possible in very
warm weather.

Blue ointment, a mercury prepara-
tion which may be bought of any drug-
gist, has been successfully tried out by
many Petaluma ranchers and is highly
recommended by experiment stations.
It is thoroughly mixed with an equal
quantity of vaseline, and an amount
of the mixture no larger than a kernel
of corn rubbed into the fluff about the
vent. This ointment is poisonous and
must be carefully handled.

To prevent head lice in baby chicks,
grease heads with lard. Dust at first
with buhach, afterward with any good
louse powder

Turkeys are even more susceptible
than chickens to the ravages of lice
and should be dusted thoroughly under
wings and over head and back at least
once a week.

Mites

The common red mite, *Dermanyssus
gallinae*, is found in almost every hen
house that is not protected against it
by painting and spraying. It hides in
cracks, under the straw in nests, and
under the ends of roosts, and comes
out at night to suck the blood of its
victim. Absolute cleanliness is the
only protection against it.

Wash walls and roosts every two
weeks with the garden hose and paint
with a mixture of three parts kerosene
and one part crude carbolic acid or
three parts kerosene and one part
cresol, or with cresol disinfectant,
which is made by steeping a ten cent
cake of laundry soap in a pint of
water till a paste is formed, adding
one pound of commercial cresol, and,
when the paste is dissolved, a gallon
of kerosene. Carbolineum and other
coal-tar preparations are also recom-
mended. The main thing is that the
application be thorough, and no mite
allowed to escape. Nests should be
frequently renewed and nest-boxes
painted or sprayed. Remove all dropp-
ings at least once a week.

Brooders and coops where young
chicks are kept should be cleaned and
painted weekly with one of these prepa-
rations. Sitting hens' nests may be
made of tobacco stems or sprinkled
with tobacco dust or louse powder.
Nest boxes should be clean and new.

If necessary saturate boxes with kero-
sene, but keep the oil from the eggs.

Ticks

The poultry tick is a terrible pest
in some localities, especially where
soil is sandy and buildings are old. As
it is rarely seen in daytime, but sucks
the blood of its victim at night, it may
breed and multiply for some time be-
fore it is discovered. Fowls are some-
times protected by suspending roosts
by wires so that they do not touch the
walls, or by the use of the galvanized
iron house.

Soaking the walls of an infested
house with boiling soapsuds or with
soapsuds and kerosene, or with boiling
water alone will often rid it of ticks,
if thoroughly done, but in the worst
cases a corrosive sublimate solution
(eight ounces to 20 gallons of water)
has been found the only remedy. As
a rule, whatever will protect a build-
ing from mites will keep ticks out.
Once they are in they are the hardest
of all pests to eradicate.

Ticks that have fastened themselves
upon the heads or bodies of fowls may
be killed by touching them lightly with
a brush dipped in corrosive sublimate
diluted with alcohol, but this is a dan-
gerous remedy.

Fleas

Two varieties of fleas are known in
California, the common hen flea,
Pulex gallinae, and the stick-tight flea.
For the former thorough cleaning of
houses and painting walls and roosts
and nest boxes with carbolineum or
the kerosene and crude carbolic acid
mixture, with especial attention to
dark corners, or better still, their
elimination, and frequent changing of
straw in nests is sufficient treatment.

Stick-tight fleas, which are usually
found on dry, sandy soil, must be re-
moved from the heads of the birds
where they sooner or later find lodg-
ing, and also from the soil of the runs.
Paint the heads, where the fleas have
fastened themselves, with equal parts
kerosene and olive oil in which has
been mixed a little carbolated vasa-
line, taking care not to touch the eyes.
Clean runs thoroughly, removing
feathers, droppings and litter. Dis-
solve ten cents' worth of rock salt in
two gallons of water, add lime enough
to make a thin whitewash, and sprin-
kle the ground well. Keep the soil
moist by sprinkling for several days,
or, if possible, till cooler weather, for
heat and dryness are the conditions
under which fleas thrive, and damp-
ness is fatal.

DIRTY WATER DANGERS

How much disease amongst poultry
has its start in the drinking crock?
Even in the cool climates of the East
I have known first class poultrymen
attribute 50 per cent to the water.
One of the most successful men I ever
knew gave his chickens no water at
all for the first two months, and rarely
lost one. All the liquid they ob-
tained was from the morning dew and
the moisture in their soft food. Poul-
try don't need liquid always before
them any more than humans do. In
the hottest weather I see plenty of
men who practically never drink ex-
cept at meals, and they are quite as
well as those who don't like to let the
ice water out of their sight. What
happens when fowls do have water
always before them, especially in very
hot weather, is that they speedily
make it filthy and unsanitary. Instead
of being beneficial, it only becomes a
ready medium for conveying disease.
It is not easy to avoid this happening.
A running stream is the ideal but that
cannot be had by most people. The
next best thing is—plenty of shade of
course being provided—to let them
have what water they really want at
certain times, morning and night in
particular, and then turn the crocks
over. They may not like it at first,
but it is simply a matter of habit, and
they will soon understand. When you
have only a few birds it is not difficult
to do this.—J. R. Henderson, Phoenix,
Arizona.

Lee's Insect Powder

LIVE STOCK

Big Type Poland Chinas—I have an extra
good lot of strictly high class young boars from three months to one year old that are fit to head any herd anywhere. Visitors say they are the best they have seen. They have the large size, the good hams and shoulders, the strong arched backs, great length and depth of body, plenty of smoothness, mellowness and quality—in fact, they have two good ends and a good middle, are good lookers and money makers. Their dams are either from Illinois, Iowa or Missouri, or they are from dams whose sire or dam are from these states. These boars are sired by Iowa Wonder, who will weigh over 1000 pounds in show condition. He is a son of A WONDER, the greatest Poland China boar living or dead. These young boars carry the stamp of their sire and will sire pigs that will please you. Satisfaction guaranteed in every particular. I am overstocked. I have boars galore. I will sell them at extremely low bargain prices. No females for sale at present. The book on "THE HOG SUPREMACY—THE POLAND CHINA" will be sent to you free for the asking.

Yours for the BIG TYPE—the kind that grow faster and larger and have more pigs. Geo. A. Smith, Corcoran, Cal.

For Sale—Our Fine Registered Berkshire
Boar, Banker's Brother, A. B. A. No. 196175. Just coming two years old. Good quality and very active. A "top-notch." Price \$40.00. Also two five-months-old registered boar pigs by him out of Silver Star 9th A. B. A. No. 196557 and Lady Corona A. B. A. 199113 at \$15.00 each. These animals all in fine condition and can be seen at our ranch near Corona, Riverside County. Address Sterling Milk Co., Room 6, H. W. Hellman Bldg., Los Angeles.

Billiken Herd—Pure bred, pedigreed O. I.
C. Swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

Del Dayo Farm (Old Haggin Bottom
Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

Farmers and Dairymen—Liquid Ice to
keep milk and cream sweet for 72 hours, fifty cents pint, also, poultry conditioner and egg producer, fifty pounds prepaid or both formulas for one dollar. Sublist, Box 127, Tacoma, Wash.

The Efficiency of Spray Machinery

Prof. C. W. Woodworth Writes for Cultivator Readers of Economy of Operation of Spray Machinery

A SPRAYER may often desire to know whether he is operating his outfit in such a way that he is securing the greatest economy in the work required in applying the spray. The necessary data is not available in any of the literature devoted to spraying to enable the determinations to be made; and the method of testing such apparatus is neither difficult nor does it require much expenditure of time.

The three features of a spray apparatus that must be separately tested are the engine, the pump and the nozzle. In the present paper we will only give the method of comparing the theoretical horse power with that obtained in actual practice.

a man can pump a gallon in five minutes and maintain a pressure of 90 pounds he is doing two-tenths of a gallon per minute, which by the table shows that he is exerting 1.04 man power and on a spurt he could do very much more than that.

The German military authorities are reported to have sent notice to all the sugar manufacturers in the country that statements must be made out covering the stocks of jute sacks, canvas, thread, rope and other materials used for the packing of sugar. As there is a shortage of these articles in Germany, the military authorities plan to commandeer the stocks on

The amount of power necessary to discharge a certain quantity of water under a specified pressure can be calculated as equal to the weight of that amount of water multiplied by the number of feet of height necessary to produce the pressure of discharge. Thus, since the weight of a column of water a foot high and a square inch in section is a little less than half a pound, a column over 200 feet high would give a hundred pounds to the square inch. A gallon weighs about eight and one-third pounds and therefore the delivery of a gallon at 100 pounds is equivalent to upwards of 1667 foot pounds.

A horse power is 3300 foot pounds per minute and therefore should give two gallons per minute at 100 pounds pressure, but in practice it is found it requires more power than this, (1) because an engine seldom is kept up to its rated horse power and (2) to overcome the friction in the pump, it is a common practice, therefore, to obtain an engine with four times the horse power necessary, thus expecting the efficiency to run almost as low as 25 per cent. Much better results than this should be secured. The method of testing is to find the maximum pressure the engine will make with all lines of hose open and find how long it takes, under these conditions, to fill a fifty-gallon barrel from which one can figure the minutes per gallon and by consulting the above table read the horsepower secured on the line corresponding with the readings on the pressure gauge. Then calculating what per cent this is of the rated horse power of the engine gives the per cent efficiency.

Thus if it takes ten minutes to fill the 50-gallon barrel and a five horse power engine is just able to hold the pressure up to 70 pounds, the rate per minute is five gallons and the table gives 2.02 horse power. This is 40 per cent of five and therefore the outfit shows 40 per cent efficiency.

The table can be used for man power on a hand outfit by reading the top line of figures as tenths of gallons since a man power is usually figured as a tenth of a horse power. If

hand and use them for military purposes.

“High Pressure Sprayers”

EXTERMINATE

the Tree Pest, while the low pressure or fog Sprays merely suppress them for a time.

“S-B-U” High Pressure Power Sprayer

Actual experience and suggestions of prominent fruit growers have now taught us that true results are only obtained from spraying when “spray force” is made the chief requisite.

A “spray force” of not less than 225 pounds’ pressure is necessary for Tree Pest and Tree Disease EXTERMINATION. To get this pressure and economically maintain it the Spray Pump must be especially designed for the engine. This has been done in our “S-B-U” HIGH PRESSURE POWER SPRAYER, and a talk with OWNERS will convince you of its merits.

Write for special literature “S-20” together with our low prices on Spray Outfits.

“Creeping Grip” Tractor of General Utility

Plowing is Only One-Third of Your Work. The “Creeping Grip” is the Rancher’s Best Friend.

This tractor materially reduces the cost of plowing, harrowing, seeding, harvesting and hauling. The creeping principle provides more than five times the tractive surface obtained with the wheeled tractor. The bearing surface on the ground is wide and long and keeps the tractor on top of the ground and does not pack the soil or bury itself.

Have you a tractor problem? We can supply you the size tractor best suited to the work you have to do. On exhibition in Los Angeles. Catalogues for the asking.

"Gomor" Makes Car and Money Go Farther

Your car will run 25% to 50% farther on each gallon of gasoline by using "Gomor"—the scientific lubricant.

"Gomor" is a marvelously refined oil that is introduced into motors through carburetor with the gas. A small amount of "Gomor" (1/2 pint to ten gallons gasoline) poured into the gas tank is sprayed on cylinder walls, pistons, valves, etc., thus greatly reducing friction and eliminating carbon formations. Motor runs perfectly on very lean mixture and power is materially increased. "Gomor" reaches vital parts of motor that ordinary lubricants fail to touch.

1000 Tests Prove Our Claims

"Gomor" is not an experiment. Upward of one thousand tests of "Gomor," covering a period of four years, have been made. These tests, conducted by many leading automobile engineers, have been most exacting. Many motor companies and thousands of private owners testify to the merits of "Gomor." Friction is the thief of power, "Gomor" reduces friction to a minimum and thereby greatly increases power. "Gomor" saves wear and tear on motors. It lengthens their life.

"Gomor" is Sold on Money Back Guarantee

The "Gomor" Oil Company is a thoroughly responsible concern backed by a number of Detroit's leading business men. "Gomor" is widely used in the East and is now being adopted by Western motorists. In Detroit its popularity is almost universal. "Gomor" sells for \$1.00 per sample quart can, prepaid to your address. "Gomor" really costs you nothing because it saves its price many times over in reduced fuel bills. Order today or send for booklet, testimonials and sworn proofs.

Household Pests

Methods of Fighting the Pests That Bother the Housekeeper. Written for California Cultivator

FREEDOM from household pests is chiefly a matter of house cleaning or rather of a clean house. Well-screened windows and doors will keep out flies and mosquitoes and thorough cleaning and airing of dark corners will discourage most of the other pests.

Flies

Such a strenuous campaign has been conducted against the house fly throughout the whole country that his numbers have been sadly decimated. It is hardly necessary to say that all garbage and household waste should be tightly covered so as to offer no breeding ground for flies. In unscreened houses or where the pests have managed to effect an entrance in considerable number it may be necessary to use fly paper (if fly paper sticks to articles coal oil will remove it). Flies may be killed in a room by tightly closing it and burning fresh buhach or by the fumes given off by carbolic acid when dropped on a hot shovel. Twenty drops of carbolic acid is sufficient.

Mosquitoes

Mosquitoes will breed in any standing water, whether it is cesspool or a few tiny drops in a rusty tin can, therefore do not let water stand anywhere in summer time. The cesspool may be made innocuous as a breeding ground by pouring a little kerosene down the pipe. Mosquitoes will not deposit eggs on the surface of water that is kept in motion; therefore, tanks holding drinking water may be made mosquito proof by keeping the surface of the water agitated by a small wheel connected with the windmill. Pools should be drained where possible or should have a thin film of crude oil and kerosene, half and half, poured over them occasionally. This will destroy eggs and larvae. Screens at doors and windows of course are the best means of keeping mosquitoes out of the house. Concentrated ammonia neutralizes the poison of the bite.

Fleas

If floors are washed with hot soap-suds containing a little kerosene or gasoline and rugs shaken and aired frequently there is little likelihood of fleas overrunning the house. An excellent flea trap is made by a sheet of fly paper in the center of which is placed a small bit of raw meat. Where cats and dogs bring fleas into the house rubbing fresh buhach into their fur will stupefy the fleas so that they will drop off. If an old newspaper is placed under the animal while you are treating it the fleas may be gathered up and burned.

Ants

To check an invasion of ants the first thing to do is to put every scrap of food possible into tightly covered jars or boxes, then clean pantry shelves. A solution of corrosive sublimate in wood alcohol wiped around shelf edge, floors and windows evaporates quickly, leaving no odor or stickiness. One or two applications in season is usually sufficient. If nests can be found pour boiling water, kerosene, gasoline or distillate into them. Fresh buhach scattered over their runs will prove a temporary deterrent but must be renewed frequently as it soon loses its strength. An effective ant trap is made by placing a little sugar syrup containing about one-fourth per cent of arsenic in a covered jar, through the top of which tiny holes have been bored. This jar may be placed on the pantry shelves as the holes are only large enough to permit the entrance of ants. They will gorge themselves on the poisoned syrup and take it back to their nests and usually in a short time the whole colony will be cleared out. Some proprietary ant

pastes well known to all housekeepers are quick exterminators.

Cockroaches

Cockroaches, water bugs and black crickets are always attracted to dark or damp places about the plumbing. Fill all cracks with cement or dust with chloride of lime, powdered borax or fresh buhach.

Rats and Mice

Rats and mice are best controlled by their hereditary enemy, the cat. Various simple traps have been patented which are very effective. One can usually find the holes where mice enter and stop them up with a piece of tin or cement.

Moths and Buffalo Bugs

Moths and Buffalo bugs (carpet beetles) sometimes drive the most careful housekeeper to desperation. Clean, air and dust as you will the pests keep coming. The only way to save woolen clothing hung in closets is to inspect frequently, shake and air. Every closet should have a window if possible, and the window should be opened often. Woolens or furs that are to be packed should first be thoroughly sunned and aired, then wrapped tightly in paper. If boxes are used all openings should be pasted with strips of paper. Boxes lined with tarred roofing paper are moth proof. Woodwork of closets should be wiped with water to which a little turpentine has been added.

The Buffalo bugs or carpet beetles tuck themselves away in dark cracks in the floors or behind baseboards. Hot water, kerosene or benzine poured into the cracks will destroy them or it is better of course to fill up cracks with paint or putty, or something of that nature. Both moths and carpet beetles may be trapped in closets by laying old woolen cloths on the floor and frequently collecting and burning.

Meal Moths, Worms, Weevils, Etc.

Unless eggs of these pests already exist in meal or flour there will be no trouble from them if foods are kept in dry, tightly-closed receptacles. Once they have entered about the only treatment possible is fumigation with carbon bisulphide. In fumigating a barrel of flour, for instance, place one-half to a full teacup of carbon bisulphide on top of the flour and cover tightly. No light should be brought near during the process of fumigation as the gas given off by this liquid is very inflammable. The gas is heavy and will penetrate down through the contents of the barrel. In very severe infestations a second treatment may be necessary. This treatment is also effective for weevils in peas or beans. It does not in any way harm or affect the food value of the materials treated.

Bedbugs

Of course we have no bedbugs in California. Occasionally, however, a traveler comes in over the overland and visits for a short time. Boiling water or corrosive sublimate will search out these pests in the tiniest cracks. The corrosive sublimate should be dissolved in alcohol. Fresh buhach powdered into cracks is also effective.

Fumigating

It is sometimes necessary to resort to fumigation with hydrocyanic acid gas to rid old buildings of vermin. All insect life will be killed by this treatment, as will also rats and mice. Directions for fumigating will be found on page 437 of this issue, also in Circular 127 of the University of California college of agriculture. This is "House Fumigation," written by Prof. C. W. Woodworth, and may be had free on request to the College of Agriculture, Berkeley.

When writing advertisers, mention The Cultivator.

FOUR-FOOTED PESTS

Continued from Page 446

poison. Handle it and the poisoned grain with the greatest care.

Gophers

The best gopher remedy is a good gopher trap. Many prefer the old-time steel trap, but this is too liable to get clogged with the dirt and stones which the gopher pushes up. Others prefer the box trap. This is rather cumbersome, however. The principal point in selecting the trap is to see that the

springs are sufficiently strong to hold Mr. Gopher once he is within its jaws. We have used traps which merely caught a bit of the fur of the animal and allowed him to escape. Once he has had this warning he becomes very wary and it is very difficult to capture him on second trial. One may sometimes find a hole open and save digging, but the best method is to dig down to the main run and set two traps. Excepting for about one month in the year, the spring breeding season, the gopher lives absolutely alone, so that when one is caught in a hole there is no use in attempting to catch another in the same place.

The best poison for the gopher is strychnine; a grain placed in the middle of a big fat raisin or in a piece of apple or potato is usually sufficient. Where a large acreage is to be covered this is perhaps more economical than trapping. Poisoning, however, must be followed more persistently, for one cannot know results as in trapping. The same poison may be used that is recommended above for squirrels. Care must be exercised to keep these poisons from poultry or other domestic animals.

Rabbits

Trapping is too slow for the jack rabbit in California. The best method of control is the rabbit drive where entire neighborhoods unite on some holiday and capture them by thousands. Where the drive is impossible the best protection is afforded by mesh wire fence. A comparatively low fence answers, for they will seldom jump or climb to any height.

When poisoning is practiced at the dry season of the year, fruit with strychnine, especially the rind of watermelon, answers the purpose best.

Coyotes

The coyote is not such a universal pest as he is usually credited with being. His food is made up largely of rabbits, gophers, field rats and other pests of the farm. However, he is not averse to a fat spring chicken or young lamb. Hence he is usually hunted and often bounties are offered for his scalp.

Trapping is perhaps the best method of control. If a trail can be found that they are wont to follow, a steel trap masked with a light covering of leaves, being sure there are no sticks to prevent the trap having full effect, will capture the coyote without the use of bait. Decaying meat dragged for a few hundred feet over the ground to the trap, with a few pieces of meat scattered at different points, will perhaps lead him over the jaws of the trap.

Poisoned meats sometimes get him, but here again there is possibility of destroying the lives of farm stock. The best poison to use is pure sulphate of strychnine; two grains are sufficient for a coyote. Where one makes a business of poisoning he often takes the druggist's two-grain capsules and fills them with strychnine. Use of the capsule prevents the meat from becoming bitter.

Rats

Losses from rats in this state are not so high as in many others, but vast quantities of grain are taken by them. In constructing farm buildings care should be taken to leave no hiding places. Rubbish or brush piles should be kept cleared away and all feed and grain stored in rat proof rooms or bins. Perhaps the best remedy is the encouraging of hawks and owls in their efforts to destroy these pests.

Perfect cleanliness about all stables and buildings is a great factor. A virus has been tried but has not proved so beneficial as was anticipated. Where rats are under barns which may be closed tightly and other animals may be removed, fumigation with hydrocyanic acid gas will kill them.

The best poison is barium carbonate. It is likewise cheap. An extremely small dose works and it has the advantage of being very slow in action so that the rats usually escape from the building before dying. Mix four parts of meal or flour and one part of the mineral. Or the barium carbonate may be sprayed upon fish or toasted bread or any food the rats like. If it is desired to hasten their death water may be placed near.

TREES

THIS year above all years, you should place your orders for trees with us. We know the condition of the markets, the probable outlook when your trees come into bearing, and every other factor that concerns the planter.

For 31 years we have been successfully growing nursery stock in this state. Our nurseries and orchards are the largest in the West—covering over 2000 acres in the choicest spots of California—located where soil and climate are conducive to growing the strongest, healthiest stock.

Thousands and thousands of successful growers all over the West will attest to the value of Roeding's true trees. They know that it pays to buy the best.

HAY	
Under date of October 30 Scott, Magner & Miller say:	
Receipts for the past week were 2366 tons. Receipts would be larger were it not for the scarcity of cars. Fancy wheat and red oat are extremely scarce and sell at top figures.	
The market is firm throughout the entire line, especially in stock hay. Trade from interior points is exceptionally good. Export trade is about as usual. Interior alfalfa is in greater supply.	
We quote the average wholesale prices for hay in carload lots on today's market as follows:	
Fancy Wheat Hay (11 bales)...	17.00@18.00
No. 1 Wheat or Wheat and Oat	12.00@15.00
No. 2 Wheat or Wheat and Oat	10.00@11.50
Choice Tame Oat	14.00@15.00
Other Tame Oat	10.00@13.50
Wild Oat	8.00@10.50
Alfalfa	10.00@14.00
Stock Hay	6.00@8.00

Citrus Fruit Market

LOS ANGELES, Nov. 3, 1915.

The few Valencias yet to go are assured of satisfactory prices as the market is now very good indeed. There are probably not more than 75 cars left in California and these will be cleaned up within a few days. The navels will start moving eastward from Northern and Central California as soon as they ripen up a little more. It is impossible to tell just how soon this will be, but growers expect to be sending out full shipments by the 20th.

The lemon market is in excellent condition. Sales were reported yesterday in Boston at over \$5.00. Only the best of stock is now going forward.

Shipments

Shipments of oranges from Southern California to date since November 1, 21 cars; lemons, 8, total 29. To same date last season, oranges, 27; lemons 7, total 34. Reports from northern and central shipping points for the new season beginning November 1 are not yet available. Last year's shipments from Tulare County: oranges, 5670, lemons, 223, total 5893. From Northern California last season: Oranges, 632; lemons 2.

PRESSURE CONTROL

Power sprayer pressure control is a very serious problem and one that has not heretofore been successfully accomplished. Every fruit grower who has ever had anything to do with a power spray pump recognizes the pressure control methods as a weak point. There must be continuous high pressure.

The new Alpha Automatic Pressure Governor, with which the Alpha Combination Power Spray Outfit is equipped, is a new device for this purpose. It is a simple arrangement of two levers and a spring on each plunger connecting rod which, when the pressure reaches a predetermined limit, automatically discontinues the operation of the pump without interrupting the driving power, again permitting the pump to resume operation when the pressure falls below the point at which it has been set.

This insures safety, secures uniform pressure and eliminates unnecessary wear, for no liquid is pumped at all when the nozzles are closed, as the pump ceases operation and remains inactive

until a nozzle has been opened and the pressure drops below a certain point. Then the pump immediately resumes operation, the engine idling during the inactive period.

No liquid is pumped except that it passes through the nozzles. The greatest danger in the use of a defective pressure regulator is the liability of bursting the pump.

Further information can be had by writing the De Laval Dairy Supply Co., San Francisco.

COMMERCIAL ACTIVITIES

The American Pump Company, formerly of 133 North Los Angeles street, has moved to 420 East Third street. This is a branch of the California Hydraulic Engineering and Supply Company of San Francisco. Mr. L. C. Thompson is the Los Angeles manager.

The Pacific Coast Roofing Manufacturing Company, of San Francisco, is offering roofing at special prices. You would probably find it to your advantage to get in touch with this company.

Don't fail to read the ads in each issue of the Cultivator. You can't go wrong by dealing with the most progressive firms and they are the ones who tell you about their products through our columns.

Charles Goodyear

An Accounting to the American People

THIS MONTH marks the fiscal close of the most phenomenal year The Goodyear Tire & Rubber Company has ever known.

Goodyear tire sales were far, far greater than in any previous year.

They were far greater than the sales of any other tire in the world. Other Goodyear products registered an equally enormous gain.

It seems to us a fitting time to render an accounting to the American people, to whom we are indebted for this unprecedented prosperity.

And it also seems to us a propitious time to acknowledge another debt to one of the world's great industrial geniuses, who spent almost his last days in a debtor's prison.

What this business is, in its first and last essence, it owes to Charles Goodyear.

It was not founded by the man whose honored name it bears.

But it has brought to that name, at last, the world-wide eminence which was denied him during his life.

His indomitable spirit has been a never-failing source of inspiration — in every branch of its thousandfold activities "his soul goes marching on."

Charles Goodyear was a man with a fixed idea — pre-destined, almost by reason of that fact, to disappointment, disaster and seeming disgrace.

His fixed idea was the vulcanization of rubber — and on this bed-rock idea there rests today that mighty industrial structure, the rubber business of the world.

In the remotest corners of the globe, wherever civilization pierces its way into the wilderness; in the jungles, and on the plantations, where millions of black men toil to satisfy the world's supply—*Goodyear means rubber and rubber means Goodyear*,

By right of inheritance, by right of adoption, by right of devotion to his high ideals, not merely the tire supremacy of the world, but the rubber supremacy of the world belongs to the Goodyear Tire & Rubber Company.

And so this business which perpetuates his name is also animated by a fixed idea.

And that fixed idea is that The Goodyear Tire & Rubber Company is bound to win the world-wide rubber supremacy if it simply upholds and maintains the goodness of Goodyear.

We believe firmly in the ultimate triumph of manufactured goodness.

We believe that the American people are everlastingly on the alert to find that which is worthy.

We believe they have awarded first prize to Goodyear because they believe in Goodyear.

We are convinced that no one can take that place away from us as long as we are true to them, and true to ourselves.

And because we prize this good will as the most precious asset of this business, nothing unworthy shall go out into the world under the brand of Goodyear.

The spirit of Charles Goodyear stands guard over every operation and every department in these great factories.

It says to every man on the Goodyear payroll, from the highest to the lowest: "Protect my good name."

Wherever, and whenever, man, woman, or child, thinks of aught that is made of rubber — we want their second thoughts to be of Goodyear.

And to the end, we repeat — nothing unworthy shall ever go out of these great factories under the brand of Goodyear.

In the upper left corner is given a photo of a Duroc-Jersey sold to a Nebraska breeder for an even \$1000 after ribbons were placed. Upper right is a Rambouillet ram owned by King Brothers & Company, said by exhibitors to yield 40 pounds of wool per clip. The ram measures five feet, two inches. The center photo shows some of Bernstein's Poland-Chinas.

At the bottom left to right: John E. Webb of Indiana, Judge of the Rambouillet class, examining texture and length of wool. 2. L. E. Frost, Editor of the Berkshire World, in characteristic pose. 3. Fred S. Moore, Secretary White Swine Record Association. 4. At left, Prof. H. W. Mumford of Illinois, Judge of the Duroc-Jerseys. At his right Bob Evans, Secretary of the American Duroc-Jersey Association.

5. The first figure at the left is Prof. C. F. Curtiss, President of the American Berkshire Association, while next to him and somewhat in the background is D. O. Lively, Superintendent of Live Stock, P. P. I. E. The gentleman at the right of picture is A. W. Foster, treasurer of the exposition, and owner of Hopland Ranch. Facing him is his son, superintendent of the ranch.

LOS ANGELES: THURSDAY, NOVEMBER 11, 1915

One Dollar Yearly

Hogs and Sheep at P. P. I. E.

Because of Quarantine Only Animals from West of Missouri River Admitted, Much to Disappointment of California Breeders. Many Compliments by Eastern Breeders for the Showing of Stock of High Quality by Coast Exhibitors.

THAT great hog state, Iowa, has 8,220,000 hogs; California with far better conditions and greater possibilities requires exactly the same figures to enumerate her hog census—excepting she cuts off one cypher; that is, has one hog where Iowa has ten.—Prof. Thompson at the banquet.

California imports annually in excess of \$75,000,000 worth of meats and packing house products, and to pay this great sum requires all that is brought to the state by our wonderful fruit crops.—D. O. Lively at the banquet.

The banquet was tendered to judges in the swine classes at the Panama-Pacific International Exposition and to other swine breeders from Eastern states by the California Swine Breeders' Association. It was held at the Inside Inn on the exposition grounds and at the same time in the same great dining room, but separated by a screen, the sheep and wool breeders were serving another banquet. The worst of it was, from a hog man's standpoint, the sheep men "had it on" the swine raisers for the main course of the "feed" was roast lamb—mint sauce and all—without a hint of juicy roast pork. Never a word of complaint, however, for all the hog men were too happy to complain over good mutton.

Mr. Thatcher of the Thatcher, Ennis & Williamson Ranch of Riverside County acted as toastmaster and was most happy in his hits on the "boys."

Prof. Mumford of Illinois and judge of Duroc-Jersey class was the first speaker. He did not laud the Reds, for praise of breeds was tabooed, but the various breed partisans fairly oozed admiration of their favorites. Even when Mr. Doty, an Iowa breeder of Reds, referred to the high quality of the California bred stock shown at the exposition and he said the veins of California breeders must be filled with rich red blood and they must have worked with unity of purpose or they would not have overcome all difficulties and made such a wonderful exhibit as they have, he was called to order by Secretary McFadden of the American Poland-China Record, and of course intensely partisan to the blacks, because of his (Doty's) reference to "Red" blood even if it were in the veins of the breeders.

Several of the speakers had a friendly criticism of California's methods of fitting—or more correctly not fully fitting—stock for such a great show. It is an art and must be

studied more closely if California is to be a world beater.

Mr. Frost of Chicago and editor of the Swine World regretted the result of the quarantine which shuts out so much Eastern stock for the reason that these gatherings where Easterners and Westerners are brought together can only advance the industry and the wealth of the nation. The fundamentals of a successful industry are fitting, feeding and selling. By all means hold public sales.

Secretary Evans of the American Duroc-Jersey Association complimented the California Swine Breeders' Association, less than three years' old, on its activities which seemed to be accomplishing more than many large associations of Eastern states which are 15 and 20 years of age.

Chairman Thatcher urged the formation of affiliating associations in every state, county and town, all to the end that America, the greatest of pork producing countries, might increase its wealth, and especially that California may change the conditions which were mentioned by Prof. Thompson and Mr. Lively.—C. B. M.

COMMENT ON EXHIBITS

By W. S. Guilford

The Sheep Show

Sheepmen of the East and West have been looking forward for two years to this great world's fair show. Had it been possible for them to have all been here, not only would there have been a big show numerically, but there would have been a greater number of highly fitted, outstanding individuals than was ever before brought together.

As it was it was a splendid show, one worth going a long way to see.

Shropshire Sheep

There was a big exhibit of Shropshires; the American Shropshire Association was very much in evidence with an attractive booth, and the banquet of the association at the Inside Inn was one of the enjoyable events of the show period.

The number of Shropshires grown on the small farms of California will increase rapidly in the next few years, and it is fortunate that there are such good flocks as that of Bishop Brothers, San Ramon, from which breeding stock can be secured. Most of the first prizes were awarded to this farm, with Knollin & Finch, Soda Springs, Idaho, close competitors. C.

PLANT DISEASES, WITH SPECIAL
REFERENCE TO NURSERY STOCKWritten for California Cultivator
By Leonard Coates

THE object of spraying trees or plants is either preventive or curative. If plant life is healthy, it does not need a physician. To keep a plant or tree healthy it must have the nourishment it requires and must not be the subject of abuse in any form.

Many other and similar statements or postulates may be made, and probably none would be denied. In the vegetable kingdom the term "disease" refers to any abnormal condition of the individual or to the presence of any creatures (man excepted) which feed upon it. This is a rather sweeping and somewhat presumptuous assertion. We pay \$5 for a canary and put it in a cage where it is greatly admired. Outside, if it eat a cherry, it is a pest and is promptly shot.

An ill-fed or neglected tree invites disease as surely as a poorly nourished or dirty chicken encourages lice. It is generally the abnormal "diseased" condition which is "attacked," not the plant itself, although the latter may suffer in consequence. Any observing horticulturist knows that a feeble or ill-nourished tree will be attacked by insect pests or fungus or other disease before its stronger growing neighbor, and that an old tree in the orchard in which has been inserted some buds or grafts will apparently be singled out for attack by numerous pests. Again it is the abnormal condition which is the real subject of attack. Every tree

or plant then should be kept in the healthiest possible condition.

In the Nursery

In California there is less danger of plants being diseased than elsewhere for the reason that stock, especially fruit and deciduous trees generally is "cleaned up" more frequently, simply because after one or at the most two years, it becomes unmarketable because too large. The "survival of the fittest" is an inviolable rule in the nursery. Weaklings are pulled up and destroyed just because they are unsaleable. If he raises inferior stock he cannot, as with other farming commodities, box or bag it and send it to market to fetch what it will. Nursery stock is grown openly, inspection always being invited. It is officially inspected while growing at least once a year, again by the nurseryman's expert while being dug; again at the packing house, and once more at the point of destination.

In the warmer parts of the state young deciduous stock is often attacked by mites or red spider, unless kept growing thriftily. In this case dry sulphur is useful, or a spray which carries sulphur in solution, but is so compounded that it will not injure the foliage. If leaf eating beetles or caterpillars should appear it may be necessary to spray with a lead arsenate. Trees when dug, which are found to have the roots affected with aphid or crown-gall are promptly destroyed. In the midst of the rush season, when the days are short and dark, when stock is being dug and shipped and new stock planted, it would be impos-

COMMUNITY COOPERATION

R. V. Holland

DO you fully realize what the community in which you live means to you individually?

You hear of wonderful commercial, social, educational and religious advantages, of fine stores, beautiful parks and good roads in other localities, all of which means but little or nothing to you compared to advantages and conveniences offered you at home. You are affected only by prevailing conditions in your community, where you are benefited by advantages and must suffer for lack of them.

Every one is more or less proud of the community in which he or she lives, and justly so. However to me the height of inconsistency is personified in people who pretend to be deeply interested in local conditions and at the same time deliberately do those things that tend to retard the development of their home communities.

Those people who proudly boast of the advantages offered by their home towns as desirable places in which to live and then refuse to extend local merchants their patronage are as ridiculous as the restaurant proprietor who eats "outs."

It may be a fact that your local stores are not as large or as handsomely equipped as some of the big city stores, but you will agree with me that your merchants cannot possibly enlarge or improve their business beyond the extent justified by the amount of patronage accorded them.

If you are interested in bringing about better local shopping facilities it is squarely up to you and other residents of your community to patronize home merchants, thus keeping your money at home insofar as possible where it will circulate in various channels for the improvement of the community.

There are only two possible reasons why persons should remain in any certain town or community: their duties demand it or they simply like to live there. Isn't this true in your case?

In either event it is to your distinct advantage to do everything in your power to assist in improving local conditions. The community belongs to you and your neighbors, and you are necessarily governed by conditions as they exist.

A prosperous community is in every instance a desirable place in which to live as it affords its residents advantages and conveniences to the extent of its prosperity, which invariably is limited to and controlled by the amount of local commercial activity.

sible, under existing conditions, to prevent some imperfect or diseased tree from being occasionally bundled up and shipped. Hence the necessity of inspection at the point of destination, which works a hardship mainly upon the purchaser. Thorough inspection at the packing house by qualified and well paid men is of course the only sane and safe method. After

that there should be no further overhauling and inspecting.

The care necessary to keep evergreen plants or trees perfectly clean or free from any insect pests is considerably more than with deciduous stock, but the preventive measures are the same, being simply the exercise of continual vigilance to keep every plant

Hitch Your Farm to Greater Profits

Pull it up into the Profit-maker's Class

Where the investment and the work pay big—where every advantage is taken of nature—where time is made to count in your favor—where the efficiency of modern machinery replaces time-worn methods—where the Ball Tread Tractor levels difficulties and obstacles, plows deeper and cultivates better—where the farm is run like a business—where money saved is money made.

The Yuba Ball Tread Tractor is compact and strong, powerful and reliable. The Ball Tread Tractor is adaptable to a hundred uses—on the farm, the orchard, the road, the forest, the desert—wherever motive power is needed.

growing vigorously and supplied with the food and moisture it requires.

Fumigation is only advisable in exceptional cases in the nursery. In other words, no plants should ever be allowed to get into a condition requiring such treatment. Young evergreen plants differ very much in their ability to go through this process without injury the "last state being often worse than the first". If a serious pest should attack a lot of nursery ornamentals, the infestation having been overlooked, it is both cheaper and better to burn the whole lot. If the stock is scarce and very valuable, the better method is to prune heavily, even to denuding of all leaves, and use strong soapsuds and a brush.

Kerosene stock emulsion and nicotine should be kept on hand as either one may have to be used at almost any time.

Birds are a great factor in the reduction or control of injurious insects and in equal proportion are cats an indirect cause of the spread of insect pests. Gophers are readily kept in check or practically exterminated by the very sure use of traps, carbon bisulphide, or at certain times of the year of poisoned bait. "A yellow throated warbler will consume 10,000 tree lice in one day; a scarlet tanager has been watched closely and seen to devour gypsy moths at the rate of 35 a minute for 18 minutes at a time," says Mr. Dobson of the Illinois Audubon Society.

Much more attention should be given to a study of beneficial insects, and birds.

CALIFORNIA ASSOCIATED RAISIN COMPANY BULLETIN

Fresno, Oct. 30, 1915.—As undoubtedly nearly every grower is waiting to receive financial statement for the crop of 1914, we desire to say that it is necessary for the growers to consider that the books are closed on October 1, and to make up 6000 accounts and notes to cover the same requires a large force of help and takes some time.

We are, however, pleased to announce that within the next few days accounts with payment attached will be mailed to every grower, and there is to be distributed over \$408,000.

In a general way we may congratulate the growers on the success we have met with in disposing of all of the 1914 crop at a time when it was known that we would produce this year the largest crop of Muscat raisins the state has ever produced. This success in disposing of last year's raisins is attributable to European conditions and also to the advertising and salesmanship employed to increase consumption throughout this country. We of course have had to sell in Europe at considerably lower prices than in this country, owing to the excessive cost of transportation and insurance to get our raisins delivered on the other side, and have therefore had to absorb part of this excessive cost of transportation.

The European demand is yet good, and better prices are obtainable. Other foreign countries, such as Canada and Australia, are also being supplied with raisins by this company, and the demand in the United States is better than the management had anticipated.

The financial condition of your company is also in better shape than it has been since its organization. As we have endeavored to meet our obligations when due, we feel confident in saying that we now have the confidence of all of the banks in this state and also in the East.—California Associated Raisin Co., James Madison, Vice President and Manager.

A GENTLEMAN

In one of our exchanges we note the following definition of a gentleman, which is so good that we here-with publish same:

The word "gentleman" is defined in this way: A man who is clean both inside and out; who neither looks up to the rich nor down on the poor; who can lose without squealing and win without bragging; who is considerate of women, children and old people; who is too brave to lie, too generous to cheat, and who takes his share of the world and lets other people have theirs.

FORTY Horse Power 7 passenger FOUR \$885

The ONLY car at less than \$1000. with—

—a 3 $\frac{7}{8}$ -inch bore x 5-inch stroke, FORTY Horse Power motor;
—plenty of ROOM for SEVEN passengers;—34x4 Goodrich Tires;
—finish put on with 25 body-finishing operations;—FULL-floating Rear Axle with TWO Timken Bearings in each hub;—112-inch wheel-base;—complete equipment of Timken Bearings;—upholstery of the finest, genuine, hand-buffed, semi-glazed leather;—and a RELIABLE battery ignition and lighting system tested on more than 150,000 cars.

These are details of design that you can find perhaps on many cars—but ONLY on this Studebaker 4-cylinder car at \$885 can you find them ALL. In power, size and quality it stands supreme. For Studebaker has set a new standard in 4-cylinder cars. And this is the ONLY 7-passenger, 4-cylinder car with a 3 $\frac{7}{8}$ -inch bore x 5-inch stroke, FORTY Horse Power motor that has ever been offered in America or Europe for less than \$1,000.

That name of Studebaker alone is enough to satisfy you of the GREAT value of this FOUR. For you know, as your fathers before you knew, the sterling quality that name stands for. But we urge you to see the car itself—for any man who knows cars will at once recognize the GREAT superiority of this Studebaker in POWER, size and quality. See the car at your dealer's—have a demonstration on the hills—and write today for 1916 catalog.

CITRUS CANKER

The seriousness of the citrus canker situation is now fully appreciated by all citrus producing sections. The Gulf states have been fully aroused for some months. Florida's loss is already appalling. The department of agriculture is being appealed to and an effort will be made to induce action by congress in the appropriation of a special fund to bring immediate relief work or at least point the way for action on the part of states. Meantime there has been organized in Florida the Citrus Canker Committee. Mr. D. C. Gillett, chairman of the committee, writes the following letter addressed to all growers of citrus fruits:

"This is a call to arms! Citrus canker will destroy every orange and grapefruit grove in Florida, as well as Alabama, Louisiana, Mississippi and Texas if it is not stopped, and there is only one way to stop it—secure an appropriation from congress large enough to enable us to buy and destroy groves in the danger zone.

"Citrus canker is in 16 counties in Florida; from Santa Rosa in the northwest to Dade in the southeast, and from Volusia in the northeast to Hillsborough, Pinellas, DeSoto and Lee in the southwest. There is every probability that every county in the state is infected from suspected nursery stock shipped from Miami and McClelleny.

"Do not think this is not your fight. Citrus canker comes as a thief in the night. It may be in your grove tomorrow.

"Do you know any congressman in the United States well enough to write him a personal letter? If you do, write him today. Send us his name and your name and keep on writing at stated intervals until you secure a favorable expression from him. Send us copies of your letters and replies.

"If you do not know any congressman intimately but have a personal friend who does know one, write him a letter and ask him to use his influence in support of the federal appropriation for the extermination of citrus canker from the United States at the next session of congress.

We must get federal aid or we are ruined—this is not a time for hesitation.

"In case of war men are ready to sacrifice their lives for the protection of their homes and country, and we say to you that we must in this case show the loyalty that we would in war, for it is war! And defeat in this means that there is no citrus industry in Florida."

Mr. Gillett also writes to the editor: "We are going after it with a spirit that knows no failure. Alabama, Louisiana, Mississippi and Texas are in the same plight as Florida and enthusiastically supporting our efforts. In several of these states the congressional delegation has already been pledged as a man to our cause. While California, Arizona and Georgia have not yet been victims of the disease they are in imminent danger and the growers know it. Citrus canker is no respecter of state borders, and the more evil its ravages in our states the greater the peril to your own citrus interest. California, Georgia and Arizona growers and commercial bodies are giving us much assistance."

While the citrus canker is sure death to the citrus trees of this and seven other states and must be eradicated with federal aid, it is not dangerous to human beings.

The only favorable thing that can be said in connection with citrus canker is that it is harmless so far as animal life is concerned.

To help preserve this billion dollar citrus industry in which citizens of this state have so vital an interest, you should at once urge your congressman to vote for a federal appropriation to clean out this pest.

For the protection of the important

citrus fruit groves in this state the citrus canker which has already attacked some of the best trees in five other states must be eradicated from all states simultaneously.

The growers in this state must get their congressmen to support and work for an appropriation by the United States government to completely wipe out this pest which is spreading alarmingly and if unchecked will completely destroy the citrus industry.

Already citrus canker has gotten beyond state or local control. It is a national question and one with which the federal government will have to deal. It involves property interests in nearly every state in the union, warehouses, shipping facilities, and so on. It is going to influence the cost of living unless it is stamped out, and the people themselves in the citrus fruit belts seem unable to cope with the situation. They are sacrificing some of their best trees, they are doing what they can to hold the epidemic in check, but they are not able to show such progress as gives any hope.

Naturally they are appealing to the federal government to come to their aid, and in several communities the government has its experts at work. But still more heroic efforts will have to be made if the great citrus fruit industry of the United States is to be preserved.

This surely can be done if the federal government can be brought to see its duty, and do it.

The Phoenix Chamber of Commerce has: Resolved, that the Chamber of Commerce, Phoenix, Arizona, on behalf of the citrus industry of the state of Arizona and the citrus industry of the whole United States does hereby urge the appropriation by congress of sufficient funds to enable proper protective and eradication methods to be carried out to the end that the disease may no more exist in this country, and be it further

Resolved, that we endorse the ef-

forts of the citrus canker committee of Florida in its efforts to secure the cooperation of the federal government in the eradication of this citrus disease.

THE CITRUS YEAR

On the market page may be seen details of the year's shipments of citrus fruits. The aggregate is 46,685 cars, or somewhat less than the shipments of the preceding 12 months. The year opened rather discouragingly. There was the biggest apple crop ever marketed; there was a depressed condition of the fruit markets; in fact, the general outlook with all kinds of business, confronted with a world war, was discouraging; then Florida offered to the country by far the biggest crop she had ever marketed since her great freeze; the Christmas fruit struck a spell of weather in all parts of the East; oranges were frozen solid in the cars in transit, and for weeks afterwards damaged goods were offered in all markets; early January brought an electrical wind to California that damaged and lowered the appearance at least of many oranges which were later shipped; the heavy rains of February with comparatively warm weather furnished a series of circumstances which had a fearfully depressing effect.

March 20, which was orange day the United States over, marked a turning point in conditions. Directly, that day aided in clearing the markets of a vast quantity of fruit, and that, with other factors, made a more satisfactory market which held from that day on, and by the time the Valencia season opened a most healthy condition prevailed, and to-day the orange has made a place for itself in the markets of the country as has no other fruit, unless possibly it is the apple.

The greatest advertising campaign ever carried on for any fruit has been conducted. Another year this will be even greater, and a crop somewhat shorter than that of last year and with more satisfactory condition of the financial markets of the world, a much smaller crop of apples commanding a much more satisfactory price, and many other conditions, especially the decision of the bureau of chemistry of the department of agriculture to stand by the former ruling demanding the eight to one test, all go to show that the returns to the grower will be far better. In addition Florida's output the coming year will perhaps be three-fourths of last year's—that as to oranges. The grapefruit crop will not be over 50 per cent of last year's. Its greatest marketing organization has a comparatively small proportion of her fruit under its control, but it is exerting a steady influence.

The early November rain is also reassuring. The orange grower always dreads the cold winter; nevertheless the wise grower is preparing for frost protection.

Mr. Weldon's estimate of various orange producing counties: Fresno, 65 per cent of a crop; Kern, 50 per cent; Los Angeles, 80; Orange, 90; Riverside, 50; Sacramento, 100; San Bernardino, 70; San Diego, 80; Santa Barbara, 100; and Tulare, 70. Lemons run from 75 to 100 per cent of normal crop.

LOS ANGELES COUNTY FARM BUREAU.

President J. H. Norton of the Gardena Valley Chamber of Commerce is working for a farm bureau in Los Angeles and is sending out the following circular:

"You are respectfully requested and urged to send an agricultural representative or representatives of your organization to meet with agricultural representatives of all other county civic or agricultural organizations. The meeting will be held in the assembly room of the Los Angeles Chamber of Commerce, Saturday, November 20, at 10 a. m. The purpose of the meeting is to organize a Los Angeles County farm bureau and secure a county farm adviser.

Under the provisions of the Smith-Lever bill, which passed congress in the spring of 1914, money is appropriated which, together with state and county appropriations, creates a fund for employing county farm advisers.

NOW THAT--

MAKING MINIATURE TREES Written for California Cultivator. By Ernest Braunton.

FOR all time the report has been current that the Japanese have a secret method of growing trees in miniature, but such is by no means the case. All that one needs is to exercise extreme care and have a patience that might be likened to that of the man of the land of Uz, of whom we hear so much as the world's most notable example in the exercise of that homely virtue.

We will suppose we desire a miniature oak or similar tree having a large seed. For an oak an acorn is planted in an orange skin or similar receptacle. With a spoon scoop out the flesh from an orange, let the skin or shell dry somewhat and then fill with rich soil, placing the acorn precisely in the center of the soil mass. Put the orange in a warm, sunny position and water every day. Soon after the first shoot appears the roots will break through the orange skin and must be cut off as fast as they appear. The tree will grow into a miniature tree but a few inches high and will so continue. At the end of the first year the habit of dwarfness has become fixed and you have a perfect tree. When the roots cease to grow through the orange skin the dried or exposed ends are varnished over, orange and all, and when the latter is falling to pieces the little tree is shifted into a miniature pot and continues for all time to be a captive dwarf, for it never has a chance to develop. The habit is so fixed in the first year that the tree makes no breaks for liberty as nearly all animate prisoners do. In the years to follow the tree may be trained to a gnarly shape or any other that is desired.

Royal Foliage Plants

At the Broadway flower show in Los Angeles held during the last week in October there were displayed some of the finest foliage plants ever seen here. Among them were two species of *Carludovica*, a palm-like plant that is as full of leaves as any plant could be, one of most unusual tropical luxuriance yet hardy enough for house use.

In the same collection are several fine cycads of gigantic size that would put to shame the finest specimens of the nearly-related sago palm. There are also many plants of high decorative value that are new here but will soon be on the market, for their unquestioned value will find a market for them everywhere. To be sure, the giant specimens will not be obtainable by many of us, for this fine collection belongs to H. E. Huntington, but his superintendent, Wm. Hertich, assures me that small plants of these rarities may be obtained at low cost and in a few years will be available to all.

Popularity of Dahlias

From the many fine exhibits now to be seen from San Diego to San Francisco it is evident that the popularity of the dahlia is on the increase. For years these flowers have been so superb that I hardly expected a continuous improvement, but I am fully impressed with the excellence of this season's product and believe the dahlias of today are finer than any I have seen before. One change they have undergone of late is the same one that has made many lately introduced roses popular—the superb colorings in sunset and coppery tints of all that could come under a color generally designated as salmon. Some of them run to light shades and may be called copper-tinted buff. Others have a depth of color known as coppery red and all have that luminous sunset glow.

Shrubs for Massing

Leptospermum may be a hard name

to thrust on a plant but we have no English name for it at present. It is closely allied to the eucalyptus, yet has tiny leaves resembling those of the boxwood and myrtle. So marked is the lack of ambition for rising aloft, as is common to their cousin eucalypt, that these lowly shrubs are always broader than tall and for that reason are splendid subjects for massing in thicket-like formation, especially for hillsides, for they demand as little water as any of the eucalypts and are fully as decorative as the best of their altitudinous relations. No mistake will be made by planting freely of *leptospermums*.

That Wild Garden

Have you that plat ready for sowing that is to be your wild garden this winter? It is nearly time for sowing native and other seeds in broadcast form for winter and spring flowering. Be sure to wet down well and let the weeds start. Destroy these and then sow and rake in the flower seeds. While you may and doubtless will do as you please in the matter I would strongly advise sowing only native California wild flowers. They are better adapted by nature to the needs of our soils and climate, are as beautiful as any the world affords, cheap as any others, and we should all take a pride in growing plants and flowers exclusively Californian.

Active Garden Season

The active season of gardening is now at hand and all should get busy with such vim that it might be termed soul-stirring soil-stirring. There is so much to do now that one should have a competent guide for all gardening operations. The Cultivator's new book, *The Garden Beautiful*, was written after 28 years' practical experience by the author in all phases of gardening in this state and can be relied upon as a faithful and accurate guide. The low cost of this instructive little volume places it within the reach of all, and I am satisfied that no one who buys it will ever regret the investment. See advertisement of it elsewhere in this issue and get one now, for the longest chapter is a calendar of gardening operations that tells fully what to plant or sow each month, how to care for same and what general garden work to do at any and all seasons.

Care for Roses Now

Roses of all kinds are now growing unless they are receiving no water, and it will be found best to feed and push them along by every means in your power. Fertilize heavily and water freely, stirring the surface soil lightly but often for several times, then turn it over somewhat deeper and mulch heavily with strawy manure. This will feed the bushes well and provide a good carpet to walk upon during the rainy season. It will also prevent weeds from growing and generally result in producing the finest of rose blooms. If your roses have not been watered and are not starting into growth I would not bother with them at present. Let the rains start them and then prune somewhat in order to rid them of thin and unproductive wood. If rains come late the blossoms may escape freezing weather. Those now growing will bloom before frosts come.

Control of Bermuda Grass

After the first rain Bermuda grass will grow but little until late spring for it is native to the tropics and in cold weather is practically dormant in California. Then comes the best time to gain the mastery of it. Rake out, cut off, or pull all the Bermuda grass you may easily harvest by any or all means suggested. Then sow and rake in seeds of white clover. These will respond at once and the crop will grow all winter. By spring you will have, to all appearances, a luxuriant growth of pure clover lawn. This will

The "S-B-U" High-Pressure Power Sprayer

Built along advices of Horticultural Experts and prominent growers, to do "high pressure" work with wonderful results after fog-sprays and fumigation had failed.

Own your own High Pressure Spray Rig and be in a position to SPRAY WHEN YOU SHOULD. The right time to spray is at period of incubation or hatching of Tree Pests, don't compel yourself to rely on hired spraying or fumigation.

Write for Circulars "S No. 2".

Smith-Booth-Usher Company

228-238 Central Ave.

Los Angeles, Calif.

so shade and thereby cool the soil that Mr. Tropical Bermuda will not be able to start until quite late in spring and will scarcely show at all for a couple

of years. Try this method and be convinced that Bermuda grass, while hard to eradicate entirely is nevertheless easy of reasonable control.

Poultry for Profit

"SELECTING THE LAYERS"

By A. B. Stickney

Although I have been reading poultry literature for thirty years or more I have never seen a series of contributions extending over so long a period which maintained so uniform evidence of common sense applied to the poultry business as that displayed by your poultry editor. It is therefore with the idea of supplementing rather than differing that I should like to comment upon the article, "Selecting the Layers," which was contained in your issue of September 23.

Great emphasis is laid upon the comb, and rightly, too; for it is the chief indication of the good layer. Yet it is not infallible. At six months old pullets will occasionally show a flourishing comb, but if you pick them up you may find them light weight and with a breast the shape of an axe. You must get rid of these pullets quickly for they will be the first to catch any contagious disease and spread it among the flock.

The wedge shape is not by any means a sure indication of the good layer, although it is one of the indications, and a good one. I have much regretted that you, Mr. Editor, have not seen your way clear to give us the monthly reports of laying contests, especially the one now being conducted at San Francisco, and publish photographs of the high record hens. I am confident these photographs would reveal the fact that the heavy layer has more often the bullet shaped body than the wedge shaped. However, the vital point is that the hen must have the capacity somewhere, but it is not necessarily in the large end of a wedge shape. Broadness of back, even if the back is short, may indicate equal capacity of digestive and reproductive organs. The large comb and the wedge shape may be carried to such extremes as to become abnormal indications of weakness.

Mrs. Koethen rightly says all good qualities may be summed up in the one word, vigor. But how do we surely know a vigorous hen? One of our California poultry experts who has taken many a ten dollars from poultrymen for revealing his secret of the laying hen, says in a book recently published that he knows of no way

to pick out the vigorous hen. Nevertheless the poultryman must do it or fail, for it is the very foundation and the only foundation of success in the business. Not many of us even know that a hen maintains a body temperature of about seven degrees higher than the human body, much less realize what it entails to maintain that high temperature. The lungs are the chief and the vital organ in accomplishing it. The hen must consume an enormous quantity of pure air and convert her feed into fuel rapidly to do it, and the air she takes into her lungs is, like the electric current to a motor, the origin of the power that digests and assimilates the food rapidly. Consequently she breathes rapidly and deeply. Now the lungs are located each side of the back bone just back of the shoulders. Pick up your pullet or your hen and grasp her back between your thumb and fore finger. Is she broad for her size all the way from her shoulders to her hips? If not she will never be a vigorous hen. For her lungs and lung capacity are small and you don't want her. She may even have the general wedge shape, yet her lung capacity be small. That is why you will, in my belief, find that the heavy layer has generally a round, broad backed shape.

MILCH GOAT RECORD ASSOCIATION

The milch goat breeders held their annual meeting at San Francisco Thursday, November 4. There was discussion regarding registration of pure breeds; also, owing to conditions which prevent receiving goats from Switzerland or other European countries, it was urged by some that there be a record made of grade goats when it could be shown that they were produced by a milk strain showing at least 15-16 pure blood, in time this to be known as "California" or "American" or some other breed of milch goats.

In the absence of President Cooke Mrs. Winthrop Howland presided. Secretary J. C. Darst was present. Officers were re-elected for the coming year. They are: President, Prof. Francis K. Cooke, Winnetka, Illinois; vice-president, Mrs. M. B. Bruggerman, Beaver Falls, Pennsylvania; secretary-treasurer, J. C. Darst, Dayton, Ohio. The board of directors in addition to the above is made up of Winthrop Howland, Redlands; D. R. Schmidt, Hannibal, Missouri; W. H. Miller, Carlyle, Pennsylvania; A. C. Ball, Pontiac, Illinois, and Dr. E. S. Gordon, Cranberry, New Jersey.

CALIFORNIA SWINE BREEDERS' ASSOCIATION ACTIVITY

At a meeting of the California Swine Breeders' Association directors held at the Panama-Pacific show it was decided to hold a meeting in Sacramento January 26, with a banquet that night, followed by a consignment sale of all breeds January 27, 1916. One hundred to 150 animals will be sold.

There has been great interest in the affairs of this association during the past six months and this big sale will be one of the events of the live stock year in California.

A BERKSHIRE BREEDER

Another man joins the ranks of high class Berkshire breeders. Ray C. Hannan of Corning has been building a herd of Berkshires that will do him credit. He has recently purchased a herd boar of Laurel Champion fame which will probably make a showing in future show rings. Mr. Hannan says: "Nothing but the best, then every customer spells satisfaction."

SUPERIOR GRAIN DRILLS

This picture shows how the large ranchers—the men who raise large crops of barley and wheat—sow their grain. The big rancher takes no chance, he uses the best drill that money will buy and he is sure of results. Superior drills cost you about what you are asked to pay for imitations. The patented features—exclusively Superior—used on these drills keep them in the lead. A large illustrated catalogue sent for the asking.

Write for it today and don't buy a drill until you know all about the Superior.

IT IS WELL WORTH YOUR TIME TO GET AND READ THIS BOOK.

NOW is the time to Feed Coulson's Egg Food

to your pullets as well as your hens, commencing at the age of three months. This enables them to rapidly complete their growth and get down to the business of egg laying.

Write for free book "Chick-ens" and don't be put off with any other egg food.

**Coulson Co.
Petaluma, Cal.**

A-1 FISH MEAL

will get the Fall and Winter eggs. It contains ten per cent more protein than any other Fish Meal on the market, giving ten per cent more efficiency. It contains less than five per cent Oil. This is from five to fifteen per cent less Oil than any other meal. This is a decided advantage as the Oil not only becomes rancid with age, but it carries the Fish flavor and a high percentage of oil is liable to give the eggs and flesh of the fowl a fishy flavor. A-1 is guaranteed not to impart a fishy flavor. Write for sample.

Bell Telephone Exhibit, Panama-Pacific Exposition

A Wonder of Wonders

"It is the most beautiful and inspiring Exposition the world has ever seen."—President Hadley of Yale, in speaking of the Panama-Pacific Exposition.

EVERY American should feel it a duty as well as a privilege to visit the Panama-Pacific Exposition and view its never-equalled exhibits of achievements in Art, Science and Industry.

In all this assemblage of wonders, combining the highest accomplishments of creative genius and mechanical skill, there is none more wonderful than the exhibit of the Bell Telephone System.

Here, in a theatre de luxe, the welcome visitors sit at ease while the marvel of speech transmission is pictorially revealed and told in story. They

listen to talk in New York, three thousand miles away; they hear the roar of the surf on the far-off Atlantic Coast; they witness a demonstration of Transcontinental telephony which has been awarded the Grand Prize of Electrical Methods of Communication.

This Transcontinental Line has taken the thought, labor and ingenuity of some of the greatest minds in the scientific world. Yet it is but a small part of the more wonderful universal service of the Bell System, which makes possible instant communication between all the people of the country.

Questions

THE EDITOR

and Answers

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Feeding Citron Melons

Have a large number of citrons which I wish to use for hog feed. What is the best way to feed them? Are they a fattening food? Have been chopping into fine pieces and feeding in the swill. Is this better than putting them on the ground? What is the best way to treat them to keep during the winter?—Subscriber, Creston.

Some prefer simply to break open and allow the hogs a chance to eat them as they like, maintaining that the animals are less likely to choke than when the melons are cut up in pieces, especially if the pieces are left rather large. If chopped they should be rather fine. We would not feed in the swill. Think it would be better to feed in the trough or on a clean feeding platform. As to storage, think the only point is to store in the shade where they will be kept cool. Many prefer to leave in the field where they are grown, hauling and feeding direct as needed.

Salt Bush

Please tell me the name of the plant I am sending, which is relished by stock both as a green growth and when cured. It grows with or without moisture. Would like to know its value as a cover crop or forage plant.—Subscriber.

This is Atriplex semi-baccatum, or the common Australian salt bush. It was introduced to this country from Australia and has been very generally distributed. It is of considerable value as a stock food.

Sex of Ducks

Please let me know how to tell male and female ducks apart. How old are they before one can know? What is the best age for a drake to mate with young ducks hatched June 1? My ducks are Pekins and I think the drake is a Mallard cross.—Subscriber, Santa Maria.

It is difficult to distinguish between male and female ducks before they are mature. As they grow older you will notice that among pure bred Pekins the males have a little curl of the tail feathers that the females do not have. The males are also heavier. Whether the same would be true of a cross such as you describe I do not know. Drakes and ducks of the same hatch are usually mated together, but the older the mothers the stronger and larger will be the ducklings. If you want to begin hatching in January it would be better to get eggs from older stock. I think you could hatch from those by April or May.—J. A. K.

Dodder Not Poisonous

I have noticed it has been claimed the goats used by the department of agriculture to keep down the weeds and brush on the fire trails or breaks in the mountains have died because of eating dodder or love vine which grew in the chaparral. I have dodder in my alfalfa and would like to know if there is any danger from it?—Subscriber, Blythe.

We have taken this up with several and do not find anyone who has ever found any ill effects from feeding dodder infested alfalfa to stock. We do not believe there is any harm in allowing stock to eat it.

Aphis

Please give remedy for aphis on cauliflower.—Subscriber, San Gabriel.

Only contact insecticides will work with these pests as they belong to the sucking class. Tobacco extract is the cheapest and best. Use at the rate of one pound of commercial tobacco extract to 100 gallons of water.

State Highways

Answering a Tulare County subscriber who wished to know as to the good roads which have been built with the \$18,000,000 of bonds which were sold a few years ago we have the following from Engineer A. B. Fletcher in answer to our request for information. Mr. Fletcher writes: "To August 1, 1915, about \$11,000,000 of the \$18,000,000 bond issue had been expended. In the state up to October 5 there have been about 1450 miles of road laid out as state highways. Of this mileage there are about 575 miles under construction and about 715 miles of road have been accepted by the department of engineering as completed. In your letter you refer to Santa Barbara County. In this county there have been approximately 75 miles of surveys, of which about 70 miles have been laid out as state highways and out of this mileage about 48 miles are under construction and nine and one-half miles have been accepted as complete."

Figs Souring

Can you tell me the cause of figs souring on the trees? They are the white variety. Some have been watered and cultivated but there does not seem to be much difference. Is it the climate or do they need heavy pruning?—Subscriber, Kirkwood, Tehama County.

The souring of the Adriatic and some other figs is due largely to moist and cloudy weather. Some maintain that withholding irrigation at time the fruit is ripening proves beneficial.

Value of Molasses Beet Pulp.

How much value is added to sugar beet pulp by the addition of refuse molasses? Is it more palatable, and would the addition of molasses aid in balancing the ration?—A Subscriber.

This query was referred to Prof. F. W. Woll, of the university farm at Davis. He answers: "Beet molasses contains only 4.7 per cent digestible protein and 54.1 per cent digestible carbohydrates and fat. The ratio between digestible protein and non-protein (starchy components), is, therefore 1:11.5. Since a good share of the protein substances contained in molasses is of inferior nutritive value, being composed of organic nitrogenous substances known as amides, and of nitrates, the actual nutritive ratio of molasses is wider than indicated by this figure. Dried beet pulp, on the other hand, contains 4.1 per cent digestible protein and 64.9 per cent digestible carbohydrates and fat; nutritive ratio 1:15.8. It is evident therefore that molasses does not aid in balancing rations for farm animals nor does it add much to the palatability of the beet pulp; some animals do not take kindly to either feed at first, but when once accustomed to them they are eaten with relish. In feeding experiments with dairy cows conducted by the writer several years ago at the Wisconsin station, molasses beet pulp was found to be worth about \$1.00 more per ton than plain beet pulp. According to my experience it is in general a somewhat better feed than the plain beet pulp."

F. W. White of Elk Grove sold last week to Geo. M. York of Modesto one boar and one sow from Grand Champion Berkshire Sow State Fair 1914. He also sold at same time five sows and a boar to W. H. Bent of Ontario. Mr. White shipped some very fine animals to the Swine Congress Sale at San Francisco, November 6.

Sacramento County was represented at the Swine Congress sale at San Francisco November 6 by the shipments of Berkshire swine from the following breeders: S. S. Day, Sacramento; A. B. Humphrey, Mayhews; Markova & Latta, Elk Grove; F. W. White, Elk Grove; G. A. Murphy, Perkins.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Dog Wrecks Auto

While driving along a state highway a dog ran across in front of the machine and caused it to turn turtle, damaging it to the amount of about \$125. Have we any case for damages in this instance?—Subscriber, Elk Grove.

It has been held that a person allowing his cow to run at large in the streets of the city is liable for injury and no particular reason is apparent why the same rule should not apply to a dog, but the case would probably turn upon the exact facts constituting the accident.

State School Lands

Please tell me how to and where to make application and what it costs to get state school land?—Subscriber, Anaheim.

State school lands may be purchased at the rate of \$2.50 per acre, \$20 payable within 50 days from the date of certificate issued to purchaser, and balance with interest at rate of seven per cent per annum, payable within one year after passage of any act of the legislature requiring such payment. Also the application must be accompanied by a deposit of \$20. If deed is eventually issued this \$20 is accepted in part payment of the purchase price. The purchase may be made for no less than the smallest legal sub-division. The purchaser must make affidavit that he is a citizen of the United States or has filed his intention to become such; a resident of the state; that he desires to purchase the lands described, has made personal examination thereof, and that the lands are not adversely occupied; that he desires the said land for his own use and benefit and has made no contract to sell the same. The affidavit must also show whether or not the land is suitable for cultivation, if it is, that he is an actual settler; that he has not sought to obtain school lands, which together with the present application exceed 320 acres, or if the land is unsuitable for cultivation, not to exceed 640 acres. The lands must be all in one county. Lands suitable for cultivation are defined as such that no less than one-half of the smallest sub-division, without artificial irrigation and by ordinary process of tillage, will produce average agricultural crops. This application must be filed in the office of the state surveyor general, where it is detained 90 days for approval. During that time the applicant must appear before some person designated by the surveyor general and answer under oath such questions as may be put to him regarding his application. Upon receipt of this deposition the surveyor general may approve the application. Thereafter and within 50 days purchaser must present a copy of his approved application to the county treasurer who shall receive the amount to be paid and the fee for this certificate of purchase. Thereupon the register of public lands issues to the applicant his certificate to purchase. When full payment is made for the land upon surrender of this certificate of purchase the register causes a patent to be issued by the state to the original applicant for the land. The certificate of purchase is subject to sale or transfer in like manner as a deed.

Community Property

Where man and wife own a piece

of property bought and paid for with community money can either husband or wife sell half, the deed being a joint deed, or mortgage their half without both signing the deed or mortgage or without the consent of the other? Has either party the right to dispose of personal property such as horses, cattle, hogs, etc., and would a bill of sale on such stock signed by only one of the parties be good to hold the stock?—Subscriber, Gardena.

The husband has absolute power of disposition other than testamentary of the community property, except that he may not convey same without valuable consideration. A husband and wife may by contract alter their property relations as in this case they evidently have, but by a joint deed, as such is legally understood, each of the parties has an undivided one-half interest in the whole of the property and upon the death of one the whole of the property becomes the absolute property of the other. A joint tenant could undoubtedly without the consent of the other joint tenant sell or mortgage his interest in the property, but if the joint tenant so selling or mortgaging his interest died before the other one, the other would take the whole of the property free from any such incumbrances or transfer. Whereas if the party incumbering the property should live longest, the incumbrance or transfer would apply to the whole of the property. So it will be seen that the transaction would partake much of the nature of a gamble.

Deeds

I bought some land on contract, deed to be furnished by the vendor on receipt of last payment. Now it states in the contract that the vendor shall furnish a deed free and clear of all liens or incumbrances done, made or suffered by vendor, but this is not stated in deed. Vendor says it is not necessary to have it included in the deed as a printed copy of an abstract is furnished. Is vendor right? What is the difference between a deed and a warranty deed?

It is assumed that your deed contained the word "grant". If it does, unless restrained by express terms contained in the instrument, the law of this state is that prior to the execution of the deed, the grantor has not conveyed the property or any interest therein to anyone other than the grantee and that the said property at the time of the execution of the deed is free from any incumbrances made or suffered by the grantor or any person claiming under him. It is also provided that the said two covenants may be sued upon in the same manner as if they had been expressly inserted in the conveyance. By reason of this section of the law of this state, the reason for warranty deeds has failed so that in this state we do not use the warranty deed, which contains practically the same covenants as is implied by law in this state from the use of the word "grant".

Wife's Property

Where a husband makes to his wife a grant deed of real estate that they have accumulated and earned together, along with the livestock, tools, etc. with the farm, and he recognizes it as her separate property, can she in case of sale make clear title to property without husband's signature? And in case of her death would he have any share in the estate?

A married woman can without the consent or signature of the husband convey her separate estate by deed or other instrument, but title insurance companies invariably require as a matter of precaution that the husband sign the deed. The same is true in case of a deed by the husband of his separate estate or of community property. The law gives him the right to execute such deed without the signature of the wife, but the signature of the wife is for the sake of precaution almost invariably required. In case of the death of the wife, without issue, one-half of her separate estate goes to the husband and the other half to her own relatives. If there are two or more children the husband has one-third and the children the two-thirds, but the wife may dispose of her separate estate by will and cut the husband out.

Final Telephone Efficiency

YOU can get it from the instrument shown here. One of the Kellogg kind. Works on any kind of a line and with any kind of telephone. Rings clearly with 40 telephones on the line. Compact, durable, light. Less wall space. Unbreakable receiver and mouth piece. Lightning arrester. Secret service push button to ring Central without ringing neighbors. No repair bills. 5 year guarantee on transmitter.

KELLOGG Telephones Best in the World

because they are made in the largest independent factory in the world and have to undergo the most rigid tests ever devised. There are 37 of the tests and none but a Kellogg made instrument could stand them.

Why not know real phone service. Why take chance on cheaper instruments that only mean in the end repair bills and the uncertain weak transmission of messages that is maddening. The telephone is the greatest aid in the world in linking up the lines of country people with the whole world, but the country man of today wants the best telephone. Send us your name and we'll prove to you that there is a reason for Kellogg world-wide reputation. Also will see that you get much valuable and interesting telephone information free. Write for bulletin No. 24

It was a dramatic moment at the banquet of the Berkshire Breeders of America when Superintendent D. O. Lively of the Panama-Pacific exposition told of his effort to build the greatest live stock show ever produced. It is several years since Mr. Lively was secured by the management of the exposition to arrange for a great exhibit. Many thousands of dollars were expended and men of the live stock department were commissioned to go to all parts of the world and secure the very best animals to be had. Then came the great war and with it financial depression. Then the foot and mouth disease startled the live stock world, and it asked: "Now will there be any exhibits at the Panama-Pacific? With a strong hand the department of agriculture took hold of the situation and almost rid the country of the dread disease. Its eradication was so nearly complete that renewed efforts were begun to produce a live stock show almost equal to the dreams of those in charge, but live stock breeders of the coast, especially State Veterinarian Keene, canvassed the situation the United States over carefully, and finally on the first day of October Mr. Keene issued his quarantine order which prohibited any stock from being exhibited which came from east of the Rockies.

This order stopped trainloads of hogs and cattle already on the road to the exposition. Illinois and other states through their legislatures had appropriated money to pay freight in order that their live stock breeders might be induced to show their very best, and thousands of head of the purest blood of the country were to be exhibited.

This meant for California breeders an opportunity the like of which had

never been offered before. Blood of the finest herds could be secured after inspection in the home state of our breeders. The quarantine order wiped out all this. It also blasted the hopes of the exposition management, and for the one man at least whose years of work had been filled with the hope of the greatest accomplishment given to any man in this department of work this was nothing less than disaster. And when he told the story of his hopes and their failure, the banquet room was still and every live stock breeder present realized more than ever the loss and disappointment of it all.

Notwithstanding the lack of these Eastern exhibits there was a great showing of live stock. It was really a Pacific Coast show. The quality of stock which the breeders of the Coast have been gathering together during the last five years saved the day and in some classes the greatest exhibits ever of stock by those particular breeds were made.

MUCH IN LITTLE

Owing to disappointment in not receiving from the mills the large size paper sufficient to run 32 pages the Cultivator was compelled to go to press last week without a couple of the most valuable articles intended

the world's greatest shows. A more enthusiastic gathering of live stock breeders was never held than that at San Francisco. Not only was there a great exhibition of live stock planned for, but efforts had been made to secure meetings of conventions of live stock breeders' associations. This brought from all parts of the country admirers of all the breeds exhibited. Many national associations held their conventions, their congresses and their banquets. The last few weeks will chronicle a wonderful uplift in the live stock annals of California, and indeed it is needed, for note the statements of Prof. Thompson and Chief Lively in the opening of the article on leader page of this issue. We need to produce more meat. Therein lies the interest in the advertisements to which we have referred. The wise farmer is producing more live stock, and we have more wise farmers than any preceding year in the history of the state.

We wish every subscriber could have been at this great exposition, not only to have seen the live stock but to have seen these great breeders filled with enthusiasm for their breeds. We give photos of many of these men in this issue.

HONOR TO WHOM DUE.

At the meeting of the Berkshire breeders held recently in San Francisco reference was made to the excellent work of Mr. A. B. Humphrey on his farm at Mayhews. When opportunity came Mr. Humphrey rose and expressed apprecia-

WHAT OTHERS SAY

HERE is a woman down in California who knows more about poultry than all the men in the state, and this, too, for that matter. Her name is Jean A. Koethen, and she has written a book which is published by the California Cultivator of Los Angeles, and called "Poultry for Profit." It costs a dollar, post-paid, and it ought to be in the hands of every one who is keeping hens. This paper has reprinted a lot of matter written by Mrs. Koethen and, because of its quality, her book is recommended. Climatic conditions in these states are so nearly alike that what is good or bad for fowls there is the same here. The price of three dozen eggs will get the volume and its purchase is a good investment.—Portland Oregonian.

for the pest control issue. They appear on the citrus and deciduous pages this week. They are written by Mr. Waterbury, who has had much experience in fumigation, and by Mr. Coates of Morganhill, whose experience enables him to talk from the nurseryman's standpoint in the matter of pest control. Likewise this week's issue is in somewhat the same condition.

Four members of the Cultivator force spent several days with the live stock at the Panama-Pacific Exposition, and the photographer, the writer and even the advertising man, all have made graphic returns to the readers of this week's paper. Many characteristic photographs, ready for the engraver, have been forced out for a similar lack of space. Soon these conditions will be corrected and we ask the patience of our subscribers, but honestly, don't you think there is a world of information packed into the few pages in this issue?

Later—And with all the effort still more of the good material is necessarily held over till another week. Even Mr. Waterbury's article, referred to above, is necessarily held out at last moment.

Also program of 47th State Fruit Growers' Convention at Visalia, November 18-20. Marketing, standardization and cooperation will be the great features. Sessions for Women, also sessions of State Association of County Horticultural Commissioners.

GOOD READING.

Some of the best reading in this issue of the California Cultivator is in the advertisements in the live stock department and on the second page of the paper. These advertisements are historical, for most of them chronicle winnings at one of

tion for the words of commendation and added: "The credit for the real accomplishment on my ranch is due to the man who is sitting by my side," and he pointed to Mr. Maurer, whose picture appears on the third page of this issue directly above that of Mr. Humphrey. Mr. Maurer is one of the efficient workers of the world and he has devoted his time exclusively to the work of building up a fine breed of animals, and the tribute paid to him by Mr. Humphrey called forth the prolonged applause of those in attendance for the employer who was willing to pass the credit on to the one really accomplishing the service.

ANNUAL HOLSTEIN SALE.

A Holstein cattle sale organization is being perfected in Sacramento under the leadership of J. M. Henderson. Others interested are F. F. Kiesel, William Morris and James McGillivray. A corporation is planned to hold an annual sale of Holstein cattle at the state fair grounds. Consignments large and small are to be accepted from anyone, but all cattle must be examined and approved by the organization's veterinarians and officers. All stock entered must be sound in every way, and the organization will stand behind the sales guarantee. The plans so far are incomplete, but contemplate an amply financed corporation, not run for profit but for the promotion of the best interests of the Holstein breed and breeders. Such an organization, once it has established the fact that its stamp of approval guarantees the worth of the animal, will be a power for good to the live stock industry and to the state of California.

We wish it all kinds of success.

If your clipper bruises an orange's skin you open the way to decay. The cut may be too small to notice—one decaying orange may spoil an entire box.

**You won't bruise fruit if you use
WISS ORANGE CLIPPERS**

The blades are specially curved and ground; the points and outer edges are rounded to avoid bruising.

U. S. Government experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they last longest, do best work and save money by minimizing the liability of bruising the fruit.

Agricultural News Notes

of the Pacific Coast

Northern California

The Humboldt County farm bureau annual meeting at Arcata was attended by 2000 people.

The California state grange, at its recent annual convention at Oakland, elected Joseph Holmes of Sacramento, master.

S. P. Kelly of Ferndale came home from the cattle show at the Panama-Pacific bearing 12 ribbons and cash prizes totaling \$370.

Packing houses of Chico, Butte County, have been sending out an average of two cars of dried fruits per day during the last few weeks.

Olive paste has been found by the division of viticulture of the state university to be a satisfactory way of using olives too small for pickling.

The Hercules Powder Company at Pinole, Contra Costa County, is reported as contemplating the harvesting of kelp on an extensive scale, the kelp to be used in the manufacture of potash.

It is proposed to form an irrigation district at Thermalito, Butte County, comprising an area of between 5000 and 7000 acres, the main source of supply to be the west branch of the Feather River.

The Sacramento Valley Development Association has appointed a committee to lead the water grass fight in the rice fields. It is reported that during the past three years this grass has taken complete possession of more than 2000 acres of rice land in Butte County.

Central California

A movement has been started in Stanislaus County to organize a Swine Breeders' Association.

The Stanislaus Poultry and Pet Stock Association is making arrangements for a big show to be held in Modesto December 1-4.

The executive committee of the Peach Growers' Company has decided to extend organization efforts to peach growers in the Santa Clara and Sacramento Valleys.

The Stanislaus County branch of the proposed Peach Growers' Company has selected a committee to spread information as to the new organization and secure members.

The Watsonville Apple Distributors has asked Monterey County apple growers to cooperate in the securing of a farm adviser to assist County Horticultural Commissioner Volck.

California's imported egg act, passed by the last legislature, has been carried up to the supreme court in a test case brought by the secretary of the California Bakers' Association.

Representatives from all irrigation districts in the state will meet at Modesto at a date to be announced soon. They will discuss securing of legislation beneficial to irrigation districts.

Growers of the San Joaquin Valley who are becoming interested in rice culture are urged to make careful examination of their soils before planting to make sure that they are adapted to rice.

Southern California

Buena Park in Orange County is to have an up-to-date cannery installed.

Walnut shipments are heavy at Saticoy in Ventura County. The first car was sent out on September 28.

Ventura bean farmers are using their bean straw to good advantage by spreading it on the bean fields.

Santa Ana walnut orchards have been suffering from depredations of what appears to be an organized gang of thieves.

Oxnard, Ventura County, will have its two rural routes merged. Auto delivery will be substituted for horse and wagon.

The old olive factory is being repaired at Pacoima in the San Fernando Valley to be ready for this season's olive pack.

Walnut packing is in full swing at the packing house of the Anaheim Walnut Association. This association now has a membership of 75.

The Rankin Ranch at Brawley last week received 20 cars of feeder cattle from Tucson, Arizona. More shipments are on their way to this ranch.

At the recent annual meeting of the Claremont Pomological club the following officers were elected: Charles E. Needham, president; W. O. Fritz, vice president; Mrs. B. L. Olds, treasurer, and V. V. LeRoy, secretary. The next meeting of the club will be held at the citrus experiment station at Riverside, Saturday, December 4.

The Coast

The Arizona Cattle Growers' Association will hold a convention January 10, 11 and 12.

The Western Walnut Association held its first meeting at Portland, Oregon, October 3 and 4.

The premium list of the Arizona state fair to be held at Phoenix November 15-20 offers many prizes for goats.

Sheep from the northern ranges of Arizona are being driven to winter feeding grounds in Yavapai and Maricopa Counties.

Sheepmen of Southern Idaho are reported as being well pleased with the year's business. Many report an increase in lambs of 115 per cent.

Levi Young, a Phoenix cattleman, is shipping in a trainload of 24 cars of cattle for winter pasture in the Salt River Valley. The cattle are being brought from the southern part of the state.

Following the action of the state horticultural inspector in allowing the shipment out of the state of wormy and other infected apples by "special permit," the executive committee of the Yakima Valley, Washington, Fruit Growers' Association has gone on record as condemning the action of the state authorities "in openly countenancing and abetting such shipments," and characterizing it as a "naked effort to repeal statutory law by executive order and to cast discredit upon the entire horticultural law."

POLAND CHINAS

Prize Winners

FINEST STOCK IN THE STATE, \$30 AND UP

My herd has been a consistent prize winner for many years at the best shows in California. Most of my winning hogs have been of my own breeding.

Now comes the greatest honor of all in winnings at the Panama-Pacific International Exposition.

My Herd of Splendidly Bred Brood Sows Is Headed by

HUSTLER 191721,

First prize aged boar at P. P. I. E., also first prize under six months boar at the Chicago International.

Assisted by Perfect Hustler 238209,

First prize yearling boar, P. P. I. E.

Other winnings at P. P. I. E.: Hustler's Model, first prize swine in senior class; Gold Coin 3d, 4th premium in senior pig class; Banker's Boy 1st and Chief's Victor, 1st and 2nd junior boar pig class; Her Majesty 4th, senior yearling sow; Miss Beauty, Beautiful and Lady Style, 1st, 3rd and 5th in junior yearling sow; Golden Beauty and Grand Picture, 1st and 3rd in under year pig class; Dewdrop, Gold Drop, Corrector's Lady, 1st, 2nd, 4th, junior sow pig class; in get of sire, 1st and 2nd; in produce of dam, 1st; aged boar, 1st; young herd, 1st; also premiums in exhibitor's herd, exhibitors' young herd and all barrow classes.

I breed the kind that have a high degree of quality, all the size that is necessary, and mature quickly and economically into the most desirable market hogs.

M. Bassett, Hanford, Cal.

When writing advertisers, mention The Cultivator.

"We have abandoned the use of silage altogether, altho we have an investment of approximately \$1500 in silo machinery, which will go to waste.

"We do not consider corn silage an economical feed where dried beet pulp can be obtained for \$30 per ton or less; for the simple reason that it is necessary to supplement a ration of alfalfa and corn silage with a liberal ration of high-priced grain in order to get the cows to do their best, while even the heaviest producing cow will give practically as much milk on a ration of only alfalfa and dried beet pulp as on the most concentrated grain ration. We have proved this absolutely by the official scales and test."

This is the statement of McAllister & Son, the well known breeders of Holstein Freisian Cattle. You can get equally satisfactory results. Go to your feed dealer today and order a single 100-lb. sack of either the plain or molasses dried beet pulp. Ask for Larowe's. Test it on one cow whose milk record you know—and watch results.

—is clean, wholesome, appetizing; aids digestion; contains five times as much nutriment as silage, with as great or greater succulence—swelling to fully six times its original bulk when moistened. It is put up in convenient 100-lb. bags and may be had either plain or with molasses.

FREE Our Booklet "Profitable Feeding."

—containing valuable information on feeds and feeding. Should be in the hands of every dairyman. Write for a copy—today.

THE LAROWE MILLING CO.
933 Central Building LOS ANGELES, CAL.

Save That Last Crop of Alfalfa

by Putting It in an Ideal Green Feed Silo

BECAUSE OF THE RAINY WEATHER encountered when the last crop of alfalfa is ready to cut, it is very difficult to cure.

BUT YOU NEED NOT SUFFER a loss on that account, for if put into an Ideal Green Feed Silo it will make just as good feed as when harvested in any other manner and you can silo it in the rain if necessary.

ORDER YOUR IDEAL GREEN FEED SILO NOW and get it up ready for this last crop of alfalfa when it matures.

YOU CAN COMMENCE FEEDING it just as soon as the silo is filled, and by next spring it will be empty and ready to receive that first cutting, that as hay is usually not worth handling because of the weeds it contains, and the trouble experienced in curing it.

THE SPRING FILLING can in turn be fed out in plenty of time to receive the crop of corn in the fall, thus enabling you to fill your silo three times within less than a year, any filling of which will pay you enough profit to buy the silo and at the same time provide the equal of the very best of pasture for the year round.

STOP BUYING SO MUCH MILL FEED and place your order now for an Ideal Green Feed Silo. You will never make the profit from your dairy that you should until you commence feeding silage.

WE CAN MAKE SHIPMENT within four days after we hear from you. Write us now.

SHEEP AND HOGS AT P. P. I. E.

Continued from Page 459.

E. Cleveland, Gresham, Oregon, also exhibited a good lot of Shropshires.

Cotswold Sheep

Oregon produces a lot of good Cotswolds that are bred on the farms and ranges. Many Cotswold rams are used on the Merino flocks from time to time to get more size.

The prizes were won by Wm. Riddell & Sons, Monmouth; F. A. Koser, Rickreall and D. J. Kirby, all of Oregon, and one good ram was exhibited by the University of California.

Dorset Sheep

W. H. Cleveland, Gresham, Oregon, had the only herd of this breed of horned mutton sheep, noted for the milking qualities of the ewes and the quick growing lambs.

Oxford Sheep

This big bodied mutton breed was shown by C. P. Kiser, Harrisburg, Oregon.

Southdown Sheep

Individuals of this breed of symmetrical, blocky, mutton sheep were

Rambouillet Sheep

shown by J. G. S. Hubbard, Monroe, Oregon, and the University of California farm at Davis.

Sheep of this breed were shown in two classes called Type B and Type C. The former are the more wrinkly ones, the latter the smoother sheep more desired on the range.

Exhibitors of Rambouillets are F. S. King Brothers Company, Laramie, Wyoming; Butterfield Live Stock Company, Weiser, Idaho; Quealy Peterson Sheep Company, Cokeville, Wyoming, and R. A. Jackson, Dayton, Washington. King Brothers were the largest winners.

Lincoln Sheep

There are a good many sheep of this big long woolled breed bred in Oregon, and many splendid individuals were shown by Wm. Riddell & Sons, Monmouth, Oregon, and Hawley & Son, McCoy, Oregon. There were also a number of good ones shown by Australian breeders.

Romney Sheep

Romney sheep are big bodied, long wool sheep that are very hardy. There are many of them in Australia and they were shown by breeders from that country and Wm. Riddell Jr., Monmouth, Oregon.

Corriedale Sheep

This is a breed that has been developed in Australia by crossing fine woolled Merinos with long woolled Lincolns, Cotswolds and Romney Marsh sheep. The purpose was to fix a type of cross bred sheep for the ranges.

They are being introduced by the United States government and the Wyoming Corriedale Company, Cheyenne, Wyoming.

The Wyoming Corriedale Company and several Australian breeders made a good show which was judged by Prof. F. R. Marshall of the United States department of agriculture.

Persian Fat-Tailed Sheep

The C. P. Bailey & Sons Company of San Jose are showing this breed. They have very heavy tails, weighing from 20 to 30 pounds. This part of the sheep is considered a delicacy in Persia.

Persian sheep are recommended for crossing on native sheep for increasing hardiness and mutton production.

Karakule Sheep

Lambs of this breed produce astrachan, the black curly coated wool or fur that is used in making trimmings and linings for expensive garments. One lost was shown by Alex. Albright, Dundee, Texas.

Angora Goats

The goat has a great field in California and the Pacific Coast in clearing up brush land, and the mohair from Angoras is a valuable product. Consequently there was much interest in this class.

The exhibitors and winners were C. P. Bailey & Sons Company, San Jose; Mrs. M. Armer, Kingston, New Mexico; Florence Kite, Redding; John Stump, Monmouth, Oregon, and Wm. Riddell & Sons, Monmouth, Oregon.

Milch Goats.

The showing of milch goats is not as large as was anticipated. There are some high-quality animals—Toggenbergs—from the ranches of three exhibitors. Mrs. Winthrop Hunland of Redlands makes the largest showing and has on hand a fund of enthusiasm which is catching, and intense interest is shown by crowds about the goat stalls. Miss M. Wagner for herself and Miss I. Richards of San Mateo County has some fine stock, as has Mr. Bernstein.

Only nannies are shown, as the billies were not admitted. An exhibit of cheese made from goats' milk is made by Howland Ranch. It is put up in small waxed paper containers and is good proof that an outlet for surplus milk may be had. Small cartons may be used and a regular daily supply of cheese sent to all who like the dainty.

One of the most interesting features of the hog show is the big exhibit of hog motors which has been on display all summer. This is a device by which the hog grinds his own feed, saving the cost of grinding, giving the hogs exercise, keeping the feed clean and preventing waste.

* * *

The Poland-Chinas.

Breeders of Poland-Chinas in California and the adjoining states can always make a good show. There are many individuals here that rank with the best in America, and in some districts the Poland-China leads all other breeds in the number produced. Hanford, for instance, is represented by four breeders in this show.

Secretary McFadden of the American Poland-China Record Association was in attendance and distributed the special prizes awarded to animals recorded in that association. The awards were made by a veteran breeder and judge, J. M. Kemp of Kenney, Illinois. His job was a difficult one at all times because of the differences in type. There were some of the extreme big type—others of the medium type—and when an animal of one sort was superior to another of another type he was sometimes compelled to jump from one type as first to another as second.

At the Eastern shows practically all big type Poland-Chinas are being shown, and in order to win they must be highly fitted and very fat. If the Eastern herds that were entered had competed our breeders would have learned that present-day show yard requirements call for lots of size and extreme finish. Judge Kemp wants an animal to show that it can produce a large quantity of meat at an early age; he wants the feet strong and the back fully arched. They must be big and have with their size as much quality as possible.

The big type Poland-China began to make its appearance 15 years ago. Many breeders wanted more size and bone and bigger litters, believing that it is possible to get a lard hog too fine. There was great opposition to the big hog at first—now nearly all Poland-Chinas are "big type."

One of the most interesting and commendable features of the entire swine show was the decorations put up over and around the exhibit of Poland-Chinas of W. Bernstein and W. H. Trehwitt of Hanford. They occupied the stalls that had quartered the Blackhawk horses and later the Carnation Holsteins, but instead of using potted plants for embellishment they placed farm products in a very attractive way. There were a lot of 100-pound pumpkins—one weighed 138—and all of the grain and grasses that grow in such abundance in Kings County. They had wheat and barley, milo, sorghum, Egyptian wheat, feterita rice, rye, oats—and Indian corn so big that they were accused of importing it from Missouri. The decorations were all "hog feed," making a very harmonious effect. M. Bassett of Hanford had his exhibit decorated with big Indian corn ears.

At the pens where G. V. Beckman of Lodi kept his fine lot of Poland-Chinas there was on exhibit—and being used by the hogs—the Dierks sanitary automatic hog feeder, a patented device that permits the hog to be the judge of the amount of grain he consumes and, while keeping feed before the animals constantly, pre-

Exhibitors Herd, Exhibitors Young Herd and All Barrow Classes: Bassett.

The Berkshire.

Another world's record has been broken by Pacific Coast Berkshire breeders. They have assembled the largest and best lot of Berkshire hogs ever shown at one time. Prof. C. F. Curtiss, president of the American Berkshire Association, is authority for this statement.

Prior to this time the largest show of Berkshires was held at the world's fair at St. Louis.

The strength of the Berkshire interests of California and the coast is reflected in this spectacular exhibit. Over 300 head are competing for prizes, more than twice as many as any other breed shown.

The Berkshire has made good on the Pacific Coast and has proven to be particularly well adapted to our conditions. Those who are now breeding them have been unable to supply the demands for stock and many new breeders have started herds during the past year.

Much disappointment is expressed among Berkshire exhibitors that several of the best Eastern herds that were scheduled for this show were not allowed to be here because of the quarantine. Our breeders were anxious to compete with these hogs that have been champions at the Eastern shows this fall.

Two barns are required to house the Berkshire entries.

The judging was done by F. A. Scott, Belleville, Illinois, a veteran breeder and farm newspaper man. He declared that this was the best of the 18 state and national shows of Berkshires at which he has placed the awards.

There was a large crowd of intensely interested people in attendance at the Berkshire judging ring constantly.

Eleven aged boars were lined up for judgment. In this class the great breeding boar, Grand Leader 2d, was easily the winner. He has a good

Why Let Your Cows Slink Their Calves?

What is Abortion in cows?

A contagious, communicable venereal disease that is costing the breeders of the U. S. millions of dollars yearly.

Can this disease be prevented or overcome?

It can be prevented and overcome.

What do the agricultural colleges say?

Some say it can be prevented and overcome and others say it cannot be.

What does the U. S. Government say?

The U. S. Government recommends the hypodermic treatment as the very best method of combating this disease.

Who says that Abortion cannot be prevented and overcome?

People who have not used the Roberts treatment, or who have used only part of the treatment and not according to instructions.

Who says that Contagious Abortion can be prevented and overcome?

The owners of 5,000 herds of cattle who have treated their cattle from one to four times during the past 25 years, owing to the fact that their herds had become reinfected through new animals purchased.

Has this treatment always proved successful?

No; because the directions have not been followed.

Does Dr. Roberts claim that this treatment will wipe Abortion out of any herd regardless of how long it has been afflicted?

Yes, absolutely; providing the cattle are free from tuberculosis and providing directions for treatment are followed.

What evidence is there that this is true?

Animals and herds that were pronounced incurable by veterinarians and owners after having many kinds of abortion treatments given and applied to them have been successfully treated by Dr. Roberts and have been given splendid 7-day and yearly records. Lynden Grove Betsy De Kol, 5 years old, 14,844 lbs. of milk, 585 lbs. of butter, in 265 days, is a typical case.

Do agricultural colleges indorse the Roberts treatment?

No; agricultural colleges will not indorse or recommend any commercial treatment for live stock diseases.

Does the U. S. Government recommend the Roberts treatment?

The U. S. Government indorses no commercial treatment, but in the government bulletin it recommends a treatment that is embodied in the Roberts treatment. Everything that is recommended in the U. S. Government bulletin is contained in the Roberts treatment, with ingredients that have never been made public.

If Dr. Roberts can buy infected herds, knowing them to be such, and by his treatment wipe out the disease; if Dr. Roberts can introduce the disease into a herd through infected animals, then check it and wipe it out; if Dr. Roberts can keep his own valuable herds of pure bred cattle free from tuberculosis and contagious abortion, it proves that it can be done. Dr. David Roberts has done these very things and what he can do you can do if you will do as he tells you to do.

There is a Roberts medicine for every common animal ailment. Sold by over 3500 druggists; if not at yours, write us direct, give your dealer's name. Dr. Roberts' great "Practical Home Veterinarian," 184-page cloth-bound book, sells for \$1, will be sent you postpaid for 25c, together with free sample of STOKVIGOR.

1604 Hobart Building, San Francisco

Mathews Reversible Twin Disc Plow

THIS is the only reversible disc plow which does not use segments to fix the position of the disc, and is therefore the only one which will always plow the same width of furrow both ways on level land and hillsides—and stick to the work on hillsides.

It leaves no water furrows. Discs are fixed in exactly the same working position every time the plow is lowered. Two discs wear twice as long as one—but cost you no more.

We are general agents for a complete line of Disc plows. Glad to tell you about them at any time.

At P.-P. Exposition till December 4th

H. L. Murphy of Perkins is on his way west with 42 head of Shorthorn cattle purchased for distribution in California from the best herds of Nebraska.

The Arizona state fair will be held at Phoenix, November 15-20.

head, wonderful width and depth, stands well on his feet, has a square rump and deep ham—and best of all is a breeder of wonderful prepotency. There were many of his pigs in the show, and when he was made senior champion and later grand champion the ratings met with universal ring-side approval. He is one of the great boars of the breed. Rival's Schoolmaster 2d, a very massive boar with a good back and loin, was second. Charmer's Duke 77th was shown in breeding condition, and is a boar of exceptional length and much character, resembling the great Longfellow, the boar that is the "father of the

for the University of California farm at Davis before the judging. He is a fine demonstration of the breeding quality of his sire. He has a typical head, a long, deep body, a well-arched top line and a straight bottom line, a square rump, full hams extending well down to the hocks and exceptionally strong feet and legs. Ames Rival 106th is a well finished one and there was quality and finish all down the line.

Another sensational class was the junior boar pigs (six to 12 months). Ames Rival 102d is a remarkable demonstration of the weight and finish possible in a Berkshire pig and Royal Kintyre is a splendid type with an

Oak Grove Pearl 4th.

Grand Champion Yorkshire Sow, P. P. I. E., Owned by Riverina Farms.

breed." Panama Lee was placed fourth and was very much admired by Eastern visitors. He is a very "breedy" looking boar with a good head and heart girth and a deep, wide body. He is a satisfactory breeder. There are a number of sows sired by him in the Butte City Ranch herd at Butte City that are remarkable individuals.

In the senior yearling class (18 to 24 months) the winner, Royal Pointer 2d, is a boar of great character—has a wide, well dishd face, great length and depth of body and is very even from end to end. He was rated above Bandmaster 2d, a champion at Iowa and Minnesota state fairs last year and a superior individual. Both hogs were selected in the East by W. M.

even body and a good rump. Many would have rated the pig placed third at the head of the list. He is Mayhews Leader 6th, a son of the grand champion, not so highly fitted but a boar of great character, a long body, exceptionally good feet and legs and strong heart girth. L. E. Frost, a great Berkshire judge and editor of the Berkshire World of Chicago, the breed organ, says he is one of the best in America.

"There has never been a better lot of Berkshire sows shown in the world," said Prof. C. F. Curtis as the 27 entries were lined up for judgment, and this was heartily agreed to by L. E. Frost and other veteran Berkshire men in attendance.

So good were they that any of the

Mayhews Leader 6th.

Son of P. P. I. E. Grand Champion, Bred by Humphrey, Owned by Butte City Ranch.

Carruthers, making the winning a splendid testimonial to his judgment.

The junior yearling (12 to 18 months) class was strong both in numbers and the character of the individuals shown. First honors went to Washington on Kintyre Laird, a remarkably smooth, mellow animal brought out in good condition. The Curtis bred Ames Rival, a boar with a good head and a remarkable body, was second. Another Curtis boar was third. He has an exceptionally wide back and is very deep. He weighs 675 pounds. The hogs bred by Prof. C. F. Curtis, Ames, Iowa, dean of the Iowa agricultural college and president of the American Berkshire Association, were prominent winners all through the show. There were many of them in the herds of Carruthers & McFarland and Thatcher, Ennis & Williamson. Rival's Champion Boy is a smooth, even hog, and Fashion Longfellow a long-bodied one with a good head.

The senior boar pig class (six to 12 months) was another big one. The Grand Leader 2d pig, Star Leader, that was placed first and later made junior champion and reserve grand champion, is a worthy son of his father. He was bought by Prof. J. I. Thompson

first dozen would have looked well at the head of the line, and anyone in the prize money was to be congratulated.

It was a great victory for California and a high compliment to the judgment and ability of F. W. White of Elk Grove when his state fair champion sow, Robin's Ruby, was given first prize. She was not in high condition, is nearly five years old and raised a litter of pigs this spring. Judge Scott says she has a head that is his ideal and as good hams as he ever saw on a hog, and with it she is one of the big, deep, useful sort that are great breeders.

Premier's Fashion 2d, is another big useful one. Rookwood Lady 5th, a daughter of the great Rival's Champion's Best, the great Curtis boar, was shown in excellent condition and is a wonderful sow.

The senior yearling sow class brought forth one of great scale and character in Rival's Pointer Star 13th, and a very superior animal with a fine head and a good back, the mother of a summer litter, in Forest Grove Laurel 2d. Daisy Leeth is a nice smooth one from Oregon.

Purebred Registered HOLSTEIN CATTLE

The Texas champion cow, Pauline Calamity Burke is the champion officially tested milk cow of Texas, with a record for twelve months of 16,384.9 pounds of milk and 655.45 pounds of butterfat. She was three years old and had just dropped a calf when the test started. This registered purebred Holstein cow by her performance indicates the possible profit from dairy farming in the Lone Star State, as her total feed cost was \$103.51 and net income \$635.83, not counting, of course, labor and depreciation. Investigate the big "Black-and-Whites."

THE CONSIGNMENT SALE OF BERKSHIRES

A sale of Berkshires was held Saturday afternoon under the auspices of the American Berkshire Congress at the Stadium on the exposition grounds at San Francisco.

President Charles Moore of the exposition addressed those attending the sale, calling attention to the great educational work done by the live stock department of the exposition. He is a breeder of Berkshires and a member of the association. He started the first sow of the sale, Siberfa Duchess 17th at \$100. She sold to William Carruthers at \$175.

F. A. Brush of Santa Rosa bought the grand champion sow, Riverby Princess, for \$860 and Manager Taylor of the Mrs. Anita Baldwin Ranch at Los Angeles bought the junior yearling first prize boar at \$585, and many other good individuals.

Col. Hoard of Stockton and Col. Rhoades of Los Angeles creditably handled the sale, with L. E. Frost of the Berkshire World assisting in the ring. Frost is largely responsible for success of the sale.

Forty-seven head sold for \$6,956, an average of \$148 per head.

Frank A. Brush of Santa Rosa, one of the most prominent Pacific Coast breeders, was a big buyer and bought the first prize boar pig after the sale.

C. C. Moore bought several for his Cottonwood Ranch.

Sales were made as follows:

Sales.

Anita Baldwin Ranch, Los Angeles—Grand Lady Mayhews 3rd, sow, consigned by Humphrey, \$165; Rookwood Belle 5th, sow, consigned by Steybrae Farm, \$210; Kintyre Laird, boar, consigned by Clark Bros., \$685; Silbira Royal 6th, sow, consigned by Talmage, \$145; Daisy Lee 10th, sow, consigned by Warnock, \$240; Silbira Robin Hood 9th, sow, consigned by Talmage, \$85; No. 51, Not Catalogued, \$175.

T. M. York, Modesto—Master's Rival's Princess, sow, consigned by Humphrey, \$100.

A. S. Bates, Holt—Pure Gold Longfellow's Sally 5th, sow; Pure Gold Dora's Rose 2nd, sow, \$77.50 each, consigned by Pure Gold Stock Farm.

H. Hewitt, Calistoga—Rookwood Lady 47th, sow, consigned by Steybrae, \$150.

Hopland Stock Farm, Hopland—Rival's Pointer Star 14th, sow, consigned by Steybrae, \$150.

Timken Ranch, El Centro—Rival's Pointer Star 13th, sow, consigned by Steybrae, \$225; Suisin Artful Lady, sow, consigned by Alexander, \$75.

E. K. Knollin, Chicago—Rookwood Lady 77th, consigned by Steybrae, \$340.

A. B. Humphrey, Mayhews—Kennett's Lady Lee, sow, consigned by G. A. Murphy, \$70; Miss Plattsburg A. 7th, sow, consigned by S. B. Wright, \$100; No. 52, Not Catalogued, \$100; No. 53, Not Catalogued, \$75.

F. W. White, Elk Grove—Columbia's Model, 103, sow, consigned by Murphy, \$50.

C. C. Moore, President of Exposition, San Francisco, Ranch at Cottonwood—Columbia's Model 100th, sow; Columbia's Model, 101st, sow, both consigned by Murphy, \$70 each; Lady Fay 5th, sow, consigned by Hall, \$105; Model Princess 42nd, sow, consigned by F. W. White, \$65.

Russ Avery, Los Angeles, Ranch at Lancaster—Columbia's Model 102nd, sow, consigned by Murphy, \$75; Winona Lee Laurel 4th, sow, consigned by F. R. Steel, \$50.

G. W. Wilder, Redlands—Oakes Lady Robin Hood, also Oakes L. R. H. 2nd and Oakes L. R. H. 3rd, sows, consigned by T. E. W., \$100 each; Rose Primo 2nd, sow, consigned by Wright, \$45; Nos. 47 and 48, Not Catalogued, \$60 and \$70 respectively.

Hibbard and Baldwin, Michigan—Amer Rival 106, sow, consigned by T. E. & W., \$150.

J. A. Cristy, Centerville—Wright's Columbia and Wright's Columbia 2nd, sows, consigned by Wright, \$80 each.

F. A. Brush, Santa Rosa—Riverby Princess, grand champion sow of Panama-Pacific International Exposition, \$860; Riverby Princess 2nd, sow, \$200, both consigned by D. C. Bunn.

C. A. Thayer, San Francisco—Lady Minnet H., sow, consigned by Hall, \$145; No. 43, Not Catalogued, \$180.

D. C. Bunn, Prosser, Washington—Tule Laurel, sow, consigned by Alexander, \$155. No. 50, Not Catalogued, \$250.

Traver W. Goethe, Perkins—Panama Duchess 5th, sow, consigned by F. W. White, \$40.

Winona Champion 13th, boar, consigned by Steel, \$115.

Joe Wilson, Mason, Nevada—Silbira Violet, sow, consigned by Talmage, \$125.

Carruthers & McFarland, San Francisco—Silbira Duchess 17th, sow, consigned by Talmage, \$175.

Mrs. W. H. Taylor, Santa Anita—No. 49 on Catalogue, \$155.

C. A. Bear—Daisy Lee 11th, sow, consigned by Warnock, \$180.

American Berkshire Association, Springfield, Illinois—Bought for export to South America, Silbira Robin Hood 10th, sow, consigned by Talmage, \$100.

Mogul 8-16 Oil Tractor \$675.00 Cash f. o. b. Chicago

THE small-farm tractor is here to stay.

Farms even smaller than 100 acres are rapidly being equipped with Mogul 8-16 oil tractors. Since their introduction, the great plant at Chicago has been turning out these machines by the thousands and is still behind orders.

There is only one reason for this unprecedented demand. Tractor farming pays. Horse boarders are cut down to the small number required for cultivating and the few other jobs for which tractors cannot be used. The plowing, disking, seeding and harvesting are finished without relation to the effect of weather on horses. Costs are reduced all 'round. Net farm profits are higher. Tractor farming pays well on small farms when the work is done with a Mogul 8-16. The longer you put off buying one, the more money you lose.

The Mogul and Titan lines include larger tractors to 30-60 H. P., all operating on low grade oil fuel, and a full line of general purpose oil engines, from 1 to 50-H. P. in size. See the local dealer who handles these machines or write us for full information.

Little Stories of Success

No. 10

Possibly you still look upon the Caterpillar as a big farm proposition, and are not yet convinced that it is a cheaper and better form of tractive power than horses. Listen!

E. A. Brim of Williams says: "Having used a Caterpillar almost 3 years, doing all kinds of work, I find that the expense of this work is at least one-half less than doing the same work with teams."

Cy Hermle, Winters, says: "I figure the Caterpillar is half cheaper than mules, counting all wear and tear."

Sleeper and Waller, Santa Ana, says: "In figuring the difference in cost against mules, we made a saving of \$850 during our harvest."

Can you afford to plow with teams any longer? Figure it out, interest, depreciation, feed, everything. Then write us for the actual costs of doing work with a Caterpillar "30" as reported to us by Caterpillar owners.

WANTED

Wanted—Position as foreman on citrus or walnut ranch of considerable size by capable young man, 35, married, industrious and of good character. Has had 10 years' experience as citrus fruit and walnut grower in Whittier district. All references. Correspondence welcomed. Address Box 1690, Los Angeles, Cal.

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis Minn.

Wanted—To hear direct from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

TURKEYS

Mammoth Bronze Turkeys—Limited number, young toms from extra early stock hatched in January. \$7.50 each. T. W. Thomason, R. F. D. 11, Box 579, Los Angeles.

LIVE STOCK

Big Type Poland Chinas—I have an extra good lot of strictly high class young boars from three months to one year old that are fit to head any herd anywhere. Visitors say they are the best they have seen. They have the large size, the good hams and shoulders, the strong arched backs, great length and depth of body, plenty of smoothness, mellowness and quality—in fact they have two good ends and a good middle, are good lookers and money makers. Their dams are either from Illinois, Iowa or Missouri, or they are from dams whose sire or dam are from these states. These boars are sired by Iowa Wonder who will weigh over 1000 pounds in show condition. He is a son of A WONDER, the greatest Poland China boar living or dead. These young boars carry the stamp of their sire and will sire pigs that will please you. Satisfaction guaranteed in every particular. I am overstocked. I have boars galore. I will sell them at extremely low bargain prices. No females for sale at present. The book on "THE HOG SUPREME—THE POLAND CHINA" will be sent to you free for the asking.

Yours for the BIG TYPE—the kind that grow faster and larger and have more pigs. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I. C. Swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

Del Dazo Farm (Old Haggin Bottom Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding, BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

65 Head Registered Poland China Hogs for sale; all sizes, both sexes. None better anywhere. Large and medium type. \$20.00 and up. We will please you or refund your money. W. A. Young, Lodi, Cal.

Blue Ribbon Herd Duroc-Jersey Hogs, Service Boars and Bred Gilts a specialty; also boar and two sows, not related. Meet me in S. F., 1915. prices. John P. Daggs, Modesto, California.

Thoroughbred Poland China Boars of large type for sale. Buy at home and save express. Prices reasonable. For further particulars write to Maywood Colony Nursery, Corning, Cal.

Milch Goats—Young Nubian Swiss does, bred from heavy milking stock. For prices, etc., write Miss B. Stocker, 587 N. Broad St., San Luis Obispo, Cal.

Milch Goats—Two ¾ Toggs, does, 2 years, both bred. One ¾ Toggs, doe, 7 mo.; one 15-16 Toggs, buck, 5 mo. H. D. Minor, Wasco, Cal.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Poland Chinas—Lake-Side Stock Farm. Weanlings to eight months. Satisfaction or money refunded. Geo. V. Beckman, Lodi, Cal.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Navato, Cal.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Calif.

Registered Thoroughbred Berkshires of all ages; Cholera Immune; large boned. Riccomi Bros., Mountain View, Cal.

Poland Chinas—Young Stock; either sex. Write for pedigree. Reasonable prices. Edwd. A. Hall, Watsonville, Cal.

Glenview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

B A Producer

Macatawa Everbearing Blackberry, originated by Alfred Mitting in 1909 at Holland, Michigan, a cross between Burbank's Giant Hima-laya and Early El Dorado, introduced in 1912, the only true ever-bearing Blackberry known to my knowledge. Upright grower, self-branch-

ing. The berry is very large and sweet. Oblong, no core, very small seeds, solid, fruits spring, summer and fall, grand canner, dessert, jam and jellies. Crops between 15,000 to 20,000 quarts to the acre. Send for circular and color plate, and how to grow it. One-year-old plants 3 for 50c, 6 for \$1.00, 12 for \$2.00, 25 for \$4.00, 50 for \$7.50, 100 for \$12.00. Prepaid to your city. Order now. Berrydale Gardens, lock box 685, San Jose, Calif.

Billiken herd of O.I.C. Swine. The big white kind; early maturing, weight carrying. Everything immunized against cholera by the simultaneous method. Pigs of both sexes from March, April, May and June farrows. Sires, Chief Again, Iowa Boy, Missouri Lad and Woodview Earl. Dams are all of the big, smooth type and very prolific. A few bred sows about ready for their second and third litters. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, California.

Our new book, "Gardening in California," by Ernest Brautnon, is certainly being well received. We have been selling them faster than we could get them bound.

However, we have at last succeeded in getting several hundred on hand and hope to keep ahead of the orders. The book is well printed on eggshell book paper and liberally illustrated with half-tone and text illustrations. The binding is a dark green silk cloth, which gives it a very rich appearance; it is a big bargain for \$1 or \$1.75 with subscription to California Cultivator.

SHEEP AND HOGS AT P. P. I. E.

Continued from Page 472

Thirty-seven junior yearling sows were presented for judgment, and as in the aged sow class, to be in the money required a superior individual.

This class brought forth Kintyre Bunt, the sow that was made senior champion and grand champion of the show. She is a sow with a smooth, deep, symmetrical body and wonderful quality. Rookwood Lady 96th is a splendid daughter of Rival's Champion's Best, and next to her was another by the same sire, Rookwood Belle 5th.

Rookwood Lady 77th, the winner in the senior sow pig class of 40, is a big, symmetrical one of great quality. Another deep bodied typey one is Kintyre Janet, and all down the list, even far past the place where there were no more ribbons to award, there were animals that any breeder can justly be proud of.

Thirty-four junior pigs were shown, and at the head of the list was the remarkably smooth, well finished one that was made junior champion and reserve grand champion, Riverby Princess. Rookwood Lady 107th and 108th are smooth, square ended ones of great character.

In the class for four animals the get of one sire there was a ringful of good ones. To win both first and second in such a class—as Humphrey did on the get of Grand Leader 2d—was a remarkable victory and demonstration of the great ability of this boar as a breeder. They were closely contested by the get of Rival's Champion's Best.

A great many of the Berkshires shown were cholera immune, and hog men will be glad to know that J. L. Thatcher is now handling Purity Serum.

J. L. Gish of Laws in Inyo County has a fine lot of Berkshire hogs shown in fair breeding condition.

California exhibitors of Berkshires were Pure Gold Stock Farm, Elk Grove; F. W. White, Elk Grove; F. L. Hall, Perris; S. B. Wright, Santa Rosa; A. B. Humphrey, Mayhews;

J. L. Gish of Laws; Carruthers & McFarland, San Francisco; Thatcher, Ennis & Williamson, Riverside; Stephen S. Day, Sacramento; Hopland Stock Farm, Hopland; G. A. Murphy, Perkins; C. E. Barrows, Los Molinos; Frank A. Brush, Santa Rosa; Alexander & Kellogg, Suisun; George Plummer, Fair Oaks.

Oregon was represented by F. R. Steel of Grant's Pass and D. D. Warnock, Dayton; and Washington by Charles M. Talmage, Newport; D. C. Bunn and Clark Bros., Prosser.

Berkshires

Aged Boars: 1, Humphrey—Grand Leader 2d; 2, Plummer—Rival's Schoolmaster 2d; 3, Brush—Charmer's Duke 77th; 4, Barrows—Panama Lee; 5, Steel—Big Four; 6, Wright—Duke Louis Wahler; 7, White—Dora's Duke.

Senior Yearling Boars: 1, Hopland Stock Farm—Royal Pointer 2d; 2, Carruthers & McFarland—Bandmaster 2d; 3, Hall—Rose Crest Baron; 4, Talmage—Belle's Champion 11th; 5, Wright—Wright's Plattsburg Duke.

Junior Yearling Boars: 1, Clark—Kintyre Laird; 2, Thatcher, Ennis & Williamson—Ames Rival 71st; 3, Carruthers & McFarland—Ames Rival 70th; 4, Pure Gold Stock Farm—Rival's Champion's Boy; 5, Humphrey—Fashion Longfellow 5th; 6, Talmage—Rival's Matchless Baron.

Senior Boar Pig: 1, Humphrey—Star Leader; 2, Thatcher, Ennis & Williamson—Ames Rival 106th; 3, Clark—Kintyre Duncan; 4, Warnock—Yakima Bacon 4th; 5, Carruthers & McFarland—Forest Grove Rival 4th; 6, Hall—Berryton Master of Rose Crest.

Junior Boar Pig: 1, Thatcher, Ennis & Williamson—Ames Rival 102d; 2, Warnock—Royal Kintyre; 3, Humphrey—Mayhews Leader 6th; 4 and 5, Wright—Wrights Columbia Duke and W. C. D. 2d; 6, Bunn—Yakima Sunrise 3d.

Aged Sow: 1, White—Robin's Ruby; 2, Humphreys—Premier Fashion 2d; 3, Thatcher, Ennis & Williamson—Rookwood Lady 59th; 4, Bunn—Yakima Robin; 5, White—Columbia's Model; 6, Humphrey—Master Rival's Princess.

Senior Yearling Sow: 1 and 2, Carruthers & McFarland—Rival's Pointer Star 13th and Forest Grove Laurel 2d; 3 and 4, Warnock—Daisy Lee 11th and 10th; 5, Steele—Berryton Belle 31st; 6, Talmage—Silbira Royal 3d.

Junior Yearling Sow: 1, Clark—Kintyre Bunt; 2, Thatcher, Ennis & Williamson—Rookwood Lady 96th; 3, Carruth & McFarland—Rookwood Belle 5th; 4, Humphrey—Fashion Longfellow Princess; 5, Carruthers & McFarland—Forest Grove Duchess 5th; 6, Humphrey—Grand Lady Mayhews 4th.

Senior Sow Pig: 1 and 2, Clark—Kintyre Shiela and Janet 3, Carruthers & McFarland—Rookwood Laurel 23d; 4, Humphrey—Grand Bernice; 5, Carruthers & McFarland—Forest Grove Laurel 4th;

Save Money on Wire Fencing!

-send for WHITING-MEAD'S Free 1915 catalog showing how to save 20% to 40% on Building Material

Warner Fencing \$4.10, \$4.90, \$5.55 per Roll, for Stock and Poultry

This class of fencing is known all over the country and usually sells for considerably more. First placed on the market some ten years ago to meet the demand for a substantial combination stock and poultry fencing.

It is closely woven and made of No. 14 galvanized wire, the spaces between the wires being graduated from the small mesh at bottom to keep chickens in, to the regular stock fence mesh at top. Has heavy cable edge at top and bottom, which enables it to withstand sudden shocks without injuring the fence.

Ten rods to roll and sold in full rolls only.

Height inches	Approx. Wt. per rod	Stays in ches	Bars number	Price per roll
35	7	6	15	\$4.10
45	8	6	17	4.90
55	9.2	6	20	5.55

POULTRY FENCING \$3.25, \$3.60, \$4.30, \$4.90 PER ROLL—GRADUATED MESH—GALVANIZED

Has many advantages over the ordinary poultry netting, being three times as strong, does not require a top or bottom board, as the selvege wire at top and bottom may be stretched to give perfect close fit to ground, and the top affords no place for chicken to rest.

All the features of the popular heavier fencing, including the interlocking mesh, with special graduated mesh to keep small chickens in. Sold in full rolls. 3 ft. high, \$3.25; 4 ft. high, \$3.60; 5 ft. high, \$4.30, and 6 ft. high, \$4.90.

WARNER HOG FENCING \$5.00

Specially woven hog fencing, with barb wire selvege at bottom, which effectually prevents hogs raising the fence, and does away with the necessity for and expense of bottom boards.

Made of best quality No. 14 galvanized wire, height 26 inches; weight per rod 4.5; stays, 6 inches; with 7 bars barbed at bottom. Sold in 20-rod rolls only, \$5.

POULTRY NETTING 45c, 60c, \$1.10 GALVANIZED—2 IN., 1½ IN., and 1 IN. MESH.

A great special buy, amounting to almost a full carload, in these much wanted sizes. Remember, it's all perfect in every way.

1 in. mesh, \$1.10 per 100 sq. ft., 18, 24, 36 and 48 inches high. 1½ in. mesh, 68c per 100 sq. ft., 24 inches high only. 2 in. mesh, 45c per 100 sq. ft., 18, 24, 36 and 72 inches high.

These prices will apply only so long as this lot remains in stock, so get your orders in early as they will be filled subject to stock on hand.

FENCE STRETCHER AND COM. PAINTS! PAINTS! PAINTS! WE BEAT 'EM ALL PRICES

A most necessary tool in erecting wire fences and very handy to have on the farm at all times.

May be used as a lifting hoist, similar to block and tackle, has automatic catch which holds wire or load at height required. Thousands in successful use. Two sizes, \$1.25 and \$1.50 each.

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet	\$1.15
2-ply, double-sanded, per roll of 108 square feet	\$1.40
3-ply, double-sanded, per roll of 108 square feet	\$1.65
1-ply "King" smooth, per roll of 108 square feet	\$1.25
2-ply "King" smooth, per roll of 108 square feet	\$1.50
3-ply "King" smooth, per roll of 108 square feet	\$1.75

Send for free sample. Remember we ship direct to you.

300,000 Country Homes Have Solved Their Lighting and Cooking Problems

These 300,000 families have solved this big important problem for good and all, by installing the *Pilot Lighting and Cooking Plant*. They now light their houses, barns, outbuildings, porches and roadways and cook their meals the same as if the city gas mains ran past their doors.

The verdict of this great army of *Pilot* users is universal satisfaction. For this is the greatest improvement—the one all the family enjoys the year round—the one it has always wanted.

You profit by the experience of these 300,000 families. You can obtain this same proven satisfactory lighting and cooking service for your home.

PILOT Lighting and Cooking Plant

is different from all other types of private plants for country homes. Beyond question, it makes acetylene the cheapest, safest and most convenient light and cooking fuel now available for every home wherever it is located.

Write for our handsomely illustrated, descriptive booklets giving all the facts about this modern lighting and cooking service. Tell us the number of rooms in your house, how many barns and out-buildings you have to be lighted, the number you cook for, and we will send an exact estimate showing how little a complete *Pilot Lighting and Cooking Plant* will come to for your home. This we will be glad to do without the slightest cost or obligation. Send us this information today while you have it in mind. Address our nearest office.—Department W.

The Household Department

HOUR BY HOUR

God broke our years to hours and days, that

Hour by hour

And day by day,

We might be able all along To keep quite strong.

Should all the weight of life

Be laid across our shoulders, and the future, rife

With woe and struggle, meet us face to face

At just one place,

We could not go;

Our feet would stop; and so

God lays a little on us every day,

And never, I believe, on all the way,

Will burdens bear so deep

Or pathways lie so steep

But we can go, if by God's power,

We only bear the burden of the hour.

—George Klinge.

PALESTINE AND THE ARMY OF LOCUSTS

By United States Consul Glazebrook, Jerusalem.

(The land of Palestine has just passed through a terrible invasion of locusts which has left groves and fields as bare as some of the battle torn fields of Europe. Our consul at Jerusalem writes of the losing fight waged against the invaders.)

THE recent devastation by locusts in Palestine will have disastrous effect on the people of the country, whose sustenance is thus destroyed. I have had to depend upon outside sources for some of the information, but the actual invasion, the result of the devastation, and the work of protection I have seen with my own eyes, and have aided in the latter by my personal assistance and advice. It is not an overdrawn metaphor to describe this inroad as an invasion. Truly the onward march of the serried ranks of the devastating insects was "more terrible than an army with banners." As far as the eye could reach, the fields were covered by the locusts, and even the street in front of the American consulate had the appearance in the movement of the green and black mass of a flowing river.

Such locust invasions are not unusual phenomena in Palestine. The last general and destructive visitation of the locusts occurred in 1865. Since then they have reappeared at different times in smaller numbers and limited areas, the last of these being some 11 years ago, but undoubtedly the disaster caused by the present visitation is not only greater and more general, but more profoundly felt than any in the recollection of the present generation.

On February 28, 1915, the first swarms of adult locusts were seen in the bordering "Judean Wilderness," but it was not until the early part of March that they flew over and past Jerusalem. These adults did little damage, but being of the largest and most devouring species of all migratory locusts, the same kind alluded to in that most graphic of all descriptions of such ravages, the prophecy of Joel, apprehensions were grave that the result would be most disastrous. These apprehensions have been fully realized.

As soon as the news of the locust invasion reached His Excellency, Djemal Pasha, Ottoman minister or the navy and commander of the Fourth Army, he vigorously grappled with the situation. He appointed a "central commission to fight the locusts" under the presidency of His Excellency, Midhat Bey, governor of Jerusalem. The field which the commission was to cover was the Sandjak of Jerusalem and the Vilayets of Beirut and Damascus, and this commission was officially attached to the headquarters of the Fourth Army, at Jerusalem. Dr. Aaron Aaronsohn, who is well known to the department

of agriculture at Washington, was appointed high commissioner for the above-mentioned provinces. This appointment promised well, as the doctor is one of the most scientific men in Syria and director of the Jewish agricultural experiment station of Palestine.

Under the direction of this commission an order was issued requiring every male residing in the cities from the ages of 15 to 60 years to collect 20 kilos (44 pounds) of locusts or to pay an exemption fee of one Turkish pound (\$4.40). This rule was so vigorously enforced, stores being closed if the owners could not show a receipt for eggs or cash, that about 800 persons paid the tax, while the others either gathered the required amount or purchased them from peasants who brought them in secretly for sale. In the village half of the inhabitants were compelled to go out each alternate day to dig for locust eggs.

Toward the end of May the larvae, already about an inch long, made their first appearance near Jerusalem on the plain of Raphaim and aroused the people to the necessity for immediate organized resistance. The method of procedure was to form lines of men, women, and children along the roads separating the private gardens from the open fields beyond, flagging the locusts. Tin-lined boxes were sunk in the earth in the direction in which the locusts were advancing. The flaggers would drive them together in a dense column toward the trap where guards at each end would keep them from escaping. Sometimes the drives were so large that the locusts would have to be shoveled into the boxes to make room for those pressing from behind. To protect the trees from the young crawling locusts pieces of tin or zinc, in the shape of inverted funnels, were tightly placed around the trunks of the trees.

In spite of all this fighting of the larvae instances are very rare where the results were satisfactory. Few crops or orchards escaped devastation. This was especially true on the Plain of Sharon, where the Jewish and German colonies, with their beautiful orange gardens, vineyards, and orchards, suffered most severely. The only exception was the orange gardens in Jaffa proper, which, doubtless, owed their immunity to the sea breezes. In the lowlands there was a complete destruction of the summer crops such as garden vegetables, melons, apricots, and grapes, for all of which the plain between Jerusalem and Jaffa is renowned and upon whose supply the Jerusalem markets depend. The result is that there are few vegetables or fruits to be had in the markets, and such as appear command an almost prohibitive price.

In the mountain district, notably about Jerusalem and Hebron, the heaviest loss from the onslaught of the locusts has been in connection with the olive groves and vineyards. Olive oil is a staple of food among the peasants and poorer classes, taking the place of meat. The grape, too, is a similar staple among all classes. The loss of this crop will be most keenly felt. This year, especially on account of the almost entire absence of sugar, now selling when obtained at a fabulous price, the grape crop was counted

BURN OIL

SAVE MONEY

Star Oil Gas Burner

For Cook Stove or Furnace.
Heat as intense as city gas.
Burns cheap engine distillate.
No smoke, dirt or odor.
Absolutely guaranteed. Agents wanted. Make money selling to friends and neighbors.
STAR OIL GAS BURNER CO.,
Pasadena, Cal.

Use HOME-MADE ACETYLENE to light your House and Barns; to cook your Meals

You can pick out an acetylene lighted farm as far as you can see it. The light streaming from the windows is white and indescribably beautiful—the big round lights in the barns are wonderfully brilliant. Go in and look them over at close range. You will, in most cases, find all the "fixtures" equipped to light up with the pull of a slender chain—without matches—just like electric lights.

The cheerful housewife in every one of these acetylene lighted homes will tell you that her lights have banished forever the gloom of kerosene lamps, and all the labor and drudgery their use entailed. She will tell you also of the delights of cooking on an acetylene range in a cool kitchen—with no bother of kindling, coal, ashes or soot. There are now no less than a quarter of

In gray drums with blue bands

a million families using Home-made Acetylene for both lighting and cooking. In every case the gas producing stone—Union Carbide—is ordered direct from the nearest of our

warehouses, located all over the country. In the drums in which we ship Union Carbide it is as safe to store and handle as common coal. It won't burn and can't explode. The little machines which automatically release the gas from the Carbide are called acetylene generators. The newer models are wonderfully simple and perfectly reliable—they work with no attention other than filling once a month.

We will be glad to mail our advertising literature which we are sure you will find intensely interesting. Address

upon as a substitute from which "dibs," a kind of molasses, and divers kinds of jams are made without the use of sugar.

Strange to relate, storks, which were always looked upon as the most effective enemy of the locusts, this year seemed to have been proportionately too few to have had a perceptible effect upon them. The common house sparrow and domestic fowls have doubtless devoured quantities of them, but here again the invading host was so tremendous that this natural help was not noticeable.

PEACHES PEELED BY LYE NOT INJURIOUS TO HEALTH

In spite of the idea held by many people that lye-peeled peaches are injurious to health, Professor M. E. Jaffa, consulting nutrition expert of the California state board of health, says that they are no more injurious than hand peeled fruits. Except for the marks of the knife on the hand peeled product, it is impossible to distinguish one from the other. Food value, flavor and quality are unchanged.

The process of peeling fruit by immersing it in hot lye, afterward washing several times with cold water, is used in many canneries throughout the state. The method is rapid and economical. Yet some people will not eat fruit that has been peeled by this process, fearing that it may be injurious to health. No question has been raised, however, concerning the use of the same process in preparing prunes for the market.

Analyses have been made, in order to learn if the acidity of the lye-peeled peach is less than that of the hand-peeled peach, and it was determined that the lye process does not affect the acidity of the finished product. The housewife then may be assured that canned peaches peeled by this process are wholesome and that there is nothing in them that may be injurious to health.

HOW TO FEED FAMILIES

How to feed babies, how to feed children, how to feed grown-up people—this is the subject of a new free correspondence course in "Adult and Child Nutrition," just announced by the University of California. The course was prepared by Agnes Fay Morgan, assistant professor of nutrition in the college of agriculture, and is open to everybody without cost.

The world is full of foolish and harmful fads and fancies regarding what to eat and not to eat. The object of the university in establishing this new course is to give people opportunity to learn authoritatively the plain common sense about what to eat and why. The course will explain the composition and properties of common foods, their relation to each other, their value in the body as producers of body-heat, and their power to do work, how the wear and tear of daily living and the growth of children call for building material to replace and construct body tissue, and how family dietaries should be planned in order that it may be certain a well-balanced variety is being provided and all the real bodily needs being met.

That is should be enjoyable is not the least important of the marks of a sensibly planned family dietary.

VEGETABLE RECIPES.

Scalloped Brussels Sprouts

Pick over, remove wilted leaves, and soak in cold water one quart of sprouts. Cook in boiling salted water until soft, then drain. Wash celery and cut in pieces; there should be one and one-half cups. Melt three tablespoons butter, add celery, cook two minutes, add three tablespoons flour, and pour on gradually one and one-half cups scalded milk; add sprouts and turn mixture into a baking dish. Cover with buttered crumbs and bake in a hot oven until crumbs are brown.

Cauliflower a la Huntington

Prepare cauliflower as for boiled cauliflower by removing leaves, cut off stalk and soak 30 minutes (head down) in cold water to cover. Cook (head up) 20 minutes or until soft in boiling salted water. Drain, separate in pieces and pour over the following

Panama Pacific Exp.
San Francisco

Judge a range the way you judge farm machinery

How well will it do its work? Is it built right, and of the right material? How economical to operate? Judged by these standards, the best is always the cheapest.

The Great Majestic Range is built for service—not for price. Every part is made of the best and most durable material—malleable iron, charcoal iron, copper, etc. Put together with rivets (not bolts and stove putty). Flues are lined with heavy asbestos board (not paper). That is why a Majestic bakes a full oven of bread brown—top, sides and bottom—without

turning, and with the least fuel—not for a year or so, but for years to come.

Majestic Ranges positively furnish more and hotter water than the ordinary range. Made with either left hand or right hand reservoir, or water front. The Majestic is the economical range, because it costs less in the long run.

The Majestic Range has many improvements that lighten the labor of cooking and add to its certainties. Examine the Majestic. There is a Majestic dealer in nearly every county of 42 States. If you don't know one, write us.

Write for Book.
Tells what to look for and what to avoid when buying a range. You can't judge a range by looks. You should know how they are made and why. Write for free copy

Citrus Fruit Market

LOS ANGELES, Nov. 9, 1915.

California's citrus shipping season ended at midnight October 31. The grand total of all citrus shipments was 46,685 cars, which, compared to the preceding year, that of 1913-1914, with 48,336 cars, shows a slight decrease. The coming year's crop is estimated to be somewhat shorter than that of last year. There are 500 cars of Valencia yet to go. Northern shipments of navels will not begin in time to reach Thanksgiving trade. The more general view of the season's operations will be found on editorial page.

Shipments

Shipments last year which began November 1, 1914 and ended October 31, 1915: oranges 33,317 cars, lemons 6843. Total from Southern California, 40,160; Central California: oranges 5670, lemons 223, total 5893; Northern California, oranges 630, lemons 2. For the year 1913-1914 Southern California, oranges 39,024, lemons 2954, total 41,978; Central California oranges 5878, lemons 73, total 5951. Northern California, oranges 402, lemons 5 cars.

NEW YORK, Nov. 8.—Eighteen cars Valencia, one car lemons sold. Valencia irregular; lemons unchanged. Weather fair.

Premier Exhibitor: Carruthers and McFarland.

Premier Breeder Exhibitor, A. B. Humphrey.

Chester White Hogs

Only one herd was on hand to represent this popular white breed, that of Ed. Schoel, Albany, Oregon, but this, with Fred H. Moore of the White Breeders Companion of Rochester, Indiana, the official Chester White magazine, kept the Chesters on the map. Over 25 carloads were scheduled to have come from the Middle West.

Chester Whites are growing rapidly in popularity in the East. They have made a greater gain in numbers at the big Eastern shows during the past few years than any other breed. We have many good Chesters in this state and Mr. Moore says we are going to have the number greatly increased. We heartily commend the broadmindedness of a representative of a breed who will come across the continent to a show where only one herd is shown. Breeds which have such men looking after their interests come to the front rapidly.

Large Yorkshires.

This breed was represented by the splendid Riverina Farms herd of Modesto, owned by Alex. D. McCarthy, San Francisco.

Mr. McCarthy believes in the future of the bacon hog in California and fitted his herd expecting to meet strong competition from the East. He has some of the best individuals in the breed and is well worthy to receive the special prizes offered by the breed in addition to the regular prize money. Prof. J. I. Thompson of the Davis University Farm made the awards.

Essex Swine.

One herd of Essex swine was shown by W. H. Cleveland, Gresham, Oregon. This is a breed not commonly seen. The individuals are all black with upright ears and very compact, neat and symmetrical bodies. It's one of the smallest of the fat breeds.

The Duroc-Jerseys.

When prominent Eastern breeders

Exterminate Squirrels

come to the coast and pay \$1,000 for a boar, California is surely a good breeding ground. It shows that we have the right sort of blood and that our conditions are right for producing them. H. E. Browning of Hersmann, Illinois, and J. J. Doty, Shenandoah, Iowa, two of the best breeders in the East, paid Maurice Rucker of Fair-oaks that price for Tax Payers Thirteen, first prize junior yearling, senior and grand champion of the show. Rucker showed only two head—this boar and a junior sow pig born in December. He won third in class on her.

Elmer Lamb, from Ceres, had junior champion on his junior sow pig and reserve grand champion. He also had seventh prize pig. He won second on senior yearling sow and sixth on under year boar. The junior pig that was made champion was born March 5 and weighs 220 pounds.

J. K. Fraser of Denair showed only pigs and won a reserve grand champion and junior champion, first and third on under year boar; second, third and fifth on under year sow; second and fourth on junior boar pigs; third and fourth on junior sow pigs; first on young herd, first and sixth on get of sire and the same on produce of sow.

J. E. Thorpe, Stockton, had first prize aged boar, third junior yearling boar, fourth and fifth aged sow, third senior yearling sow, second aged herd and second aged exhibitor's herd.

Other extensive winners were E. N. Manley, Lyons, Nebraska; C. A. Hoover, Gervias, Oregon, and David Brown, Spokane, Washington.

The ribbons were tied by Prof. H. W. Mumford of the University of Illinois, who was very much pleased with many of the entries. Some should have been in higher condition to have won in the Eastern shows.

The two Duroc associations were ably represented by R. J. Evans of the American, Chicago, and J. R. Pfander of the National, Peoria, Illinois. Both admit that they made a mistake in not maintaining a view herd, but they had anticipated a big Eastern show here in the fall and believed that the demand for Eastern-bred stock would be supplied at that time.

The Duroc-Jersey is a great breed and because of its prolificacy, good rustling and growing qualities is becoming very popular in California.

Hampshire Swine.

"There were some of as good Hampshires shown here as are to be seen anywhere—some of the best herds of the breed were here. No more good ones were brought out at the big Eastern shows this year—it was a credit to the breed"—this is the way H. E. Browning of Hersman, Illinois, a prominent Eastern Duroc breeder who had charge of the ring for the Hampshire show, sizes up the show of this breed.

Over 100 were shown and the prizes were well distributed among the following herds: Eaton & Hughes, Santa Rosa; J. M. Fruits, Enterprise, Oregon; E. N. Manley, Lyons, Nebraska, and Walter T. Gatton, Gardena.

Hampshires are very hardy, useful hogs and very economical pork producers. We are fortunate in having in California some of the best of the breed.

VEGETABLE RECIPES

Continued from Page 477

sauce: Mix one and one-half teaspoons mustard, one and one-fourth teaspoons salt, one teaspoon powdered sugar, and one-fourth teaspoon paprika. Add yolks of three eggs slightly beaten, one-fourth cup olive oil, and one-half cup vinegar in which one-half teaspoon finely chopped shallot has infused five minutes. Cook over hot water until mixture thickens. Remove from fire and add one-half tablespoon curry powder, two tablespoons melted butter, and one teaspoon finely chopped parsley.

Corn a la Southern

To one can chopped corn add one-half cup chopped pimiento, two eggs slightly beaten, one teaspoon salt, one-eighth teaspoon pepper, one and one-half tablespoons melted butter, and one pint scalded milk; turn into a buttered pudding dish and bake in slow oven until firm.

The Economical Beverage-Food

"Here's what you have all been waiting for—your cup of Ghirardelli Chocolate."

Ghirardelli's Ground Chocolate is as unusual for its deliciousness as for the economy that follows its use. Serve it to men whose strength must be sustained for productive work—a cup full every day.

A great food scientist says:

"Cocoa (Ghirardelli's Ground Chocolate is a blend of finest cocoa and pure sugar) might well be called the vegetable egg; but in fact cocoa contains a larger percentage of nutriment matter than the egg."

It's Economy to Serve.

Ghirardelli's

The Only

Ground Chocolate

In ½-lb., 1-lb. and 3-lb. hermetically sealed cans. There's a double economy in buying the 3-lb. can.

NAME

TRUE
TO
NAME

It Pays to Plant Foothill Grown Trees

They are notably free from root knot and diseases common to the trees grown on the river bottom and valley loam locations commonly chosen by nurserymen. They have well-branched, fibrous roots and are of well toughened bark and wood fibre.

Our Trees Give a Profitable Life-Time Service

You are sure of this when you buy from us. We are extensive fruit growers and fruit shippers as well as nurserymen. We know your needs. Submit to us your problems and we will give you the benefit of our experience and advice. We are interested in your success. Make out a list of what trees you would like to plant. Send that list to us and we will tell you honestly and frankly what you may expect from your selection in your locality.

There has been a Shortage Every Year and There is Sure to be a Shortage again this Year in Trees of the Best Selling Varieties. Don't Wait. Send Us a List of Your Wants at Once and take Advantage of Our Early Fall Prices

Here are Some of the Varieties We Specialize In

Bergtholdt's Special Selection for Home Orchard

\$3⁹⁵

For \$3.95 we will send you freight paid a selection of ten best grade 4/6 feet Deciduous fruit trees, including one grafted Walnut. Leave it to our judgment and we will give you a fine selection of the best varieties for home orchard. Or, give us your suggestion as to the varieties desired. This is an exceptional opportunity to get ten fine trees of choicest varieties of fruit for your home orchard delivered at your postoffice at a minimum cost.

Write us for our list of combination offers for home planting and our free booklet on California Fruit which gives you an accurate description of each variety.

We have also a complete assortment of all varieties of citrus and deciduous fruit trees and vines.

Prunes

Selling now at a 5c basis, are again demonstrating that of all fruit grown they are the most stable for profit. There is always a shortage of trees in FRENCH, IMPERIAL, ROBE DE SARGENT, SUGAR AND STANDARD ON MYROBOLAN ROOT. These are the best selling varieties this year and there will again be a shortage. We have a fine block of trees on Myrobolan root in each of the varieties named—foothill grown—selected in propagating—fine, hardy trees.

Write us for prices and get your order in at once while the trees can be reserved for you.

Cherries

Cherries are great money-makers in California, and on locations adapted to their culture they are as good as you can plant. There is often a shortage of trees in the best varieties. We have a good stock on both Mahaleb and Mazzard root, and if placed now can take care of your orders in any of the following: ROYAL ANNE, EARLY BURBANK, EARLY CHAPMAN, EARLY PURPLE GUIGNE, BLACK TARTARIAN, BING, LAMBERT AND BLACK OREGON.

Walnuts

When you buy a Walnut, more than any other tree, in view of the variations from the true type, you want a tree pedigreed and true. Our scions of Franquett and San Jose Mayette are cut by the pioneer walnut expert of the State, R. Wiltz of San Jose, and from trees he has had under his personal observation for years and which are of the true type and selected for performance. This is the highest pedigree given a walnut. Write us at once for full information and prices.

Shipping Plums

We have a complete assortment of every standard variety of Shipping Plums on Myrobolan root, Bitter Almond and Peach root. Write for our catalog, giving complete and accurate information concerning every variety of Shipping Plums. Let us have a list of your wants for prices. Place your order now while our assortment is complete.

Pears

On both Standard French and Japanese root. We have a fine block of trees, well rooted and hardy, in Wilder, Lawson, Bartlett and all of the later standard fall varieties.

BARTLETT PEARS, as well as all of the standard Fall Pears, have this year made a good record for the California grower, as they do every year. No fruit more profitable or with a better future.

Apricots

California has the monopoly in the production of this fruit, always profitable, and future prospects never better. There is usually a shortage, particularly of Apricots on Myrobolan root for planting on heavy loam or poorly drained locations. We have a fine block of Apricots on Myrobolan root in all varieties, as well as on Apricot and Peach root.

Olives

We are offering a limited number of trees of Mission Olives worked on Picholine root. Write us now and get in on this stock. We have also an assortment of varieties grown from cuttings.

Almonds

Are in great demand and there will be a shortage. We have a fine block of trees on Bitter Almond and Peach root.

Clingstone Peaches

This year's crop suffered from war conditions, but canners are cleaned up and are sorry now they did not make a larger pack. Bear in mind the California Clingstone has a monopoly of the world's market for canned peaches—regularly productive, can be successfully grown nearly everywhere—a good money-maker in the past and will keep up this record in future. OUR IMPROVED TUSCAN is preferable in every way to the common Tuscan in the following features:

- 1st—More regularly productive.
- 2nd—Perfectly round; uniform size and symmetry.
- 3rd—They do not split pit.
- 4th—They do not gum.
- 5th—They do not windfall.
- 6th—They are fine grain, of superior canning quality and command a premium of from two to five dollars per ton over the ordinary Tuscan.

Hausa Cling Peaches

A seedling from Phillip Cling, and has all the desirable features of that splendid variety. Ripens immediately after the Tuscan, filling the intermission between the Tuscan and Phillip when canners are running light and always command a premium. Identical to Phillips in quality and productiveness.

Phillips Cling Peaches

Our Phillips Cling are of the true type and but one generation removed from the Phillips Cling first introduced. Very few are aware of the fact that the Phillips Cling, as commonly propagated, is deteriorating from the true type in the successive propagations.

One Dollar Yearly

Making Dates

Riverside County Chamber of Commerce Meets at Indio and Thermal.
Delegates from Outside Sections are Given Ideas
as to Date Growing

If one wishes to see enthusiastic Californians let him go to the Coachella Valley. Anticipating the question, especially from those of our subscribers in the northern end of the state, "Where is the Coachella Valley?" we will say it is a part of the Colorado "desert." It is a low-down sort of place, being entirely below sea level. In some sections it runs nearly up to sea level, in others much more than 200 feet below. The sunset route of the Southern Pacific has traversed this desert for many years, and it was deemed true to name until something over a dozen years ago when some prospectors conceived the idea of determining whether water

This combination of land and water produces onions, sweet potatoes, asparagus, melons, eight or ten cuttings of alfalfa per year, figs, dates, almost every product of the earth. So when Riverside County started its chamber of commerce it found hearty support in the Coachella Valley, for the people were the kind that wished to see advancement in the community and they believed in cooperating with their neighbors. The Riverside County chamber of commerce, by the way, is a representative organization with a membership from nearly all sections of Riverside County. It encourages the get-together spirit, and the meeting at Indio and Thermal was the third in a series of meetings, and I

from date of planting the seed. At Mr. Northrup's place we were told to be free to eat all the dates we wished, and it is safe to say that his stock of dates was materially decreased as a result of the visit.

The beautiful ranch where dates were given perhaps the first test was that of Mr. Fred Johnson who planted his first offshoots some ten years ago and has one date tree illustrated in the larger figure on this page, which last year netted him over \$300. It will be noted in the photograph that there are no dates on this tree this year, which may indicate that the date, like other trees, will not bear enormously big crops every year. However, this is a matter which only years can determine. The other three trees in this picture are all loaded with fruit this year, as they also bore fair crops last year.

On Mr. Johnson's ranch are fig trees 11 years old with trunks two and three feet in diameter and with great branches which would support a whole flock of children and give finest of shade as well.

The next, and one of the most interesting places visited, was the government gardens and experimental plant in charge of Mr. Bruce Drummond. For 11 years Mr. Drummond has been investigating the possibilities of date culture. He is an enthusiast, better, he is one who makes careful investigation and is willing to state the truth in referring to the drawbacks as well as to the satisfactory features of date culture. Mr. Drummond grants that the finest of all dates is the Deglet Noor, or the moist, rich date. It will probably command the highest prices in the market, but at the same time he insists that a date of the Thuri type is due to have a greater future in the American market. This date is a medium sized one, dry and almost as hard as a bone, but at the same time it contains an exceedingly large per cent of sugar. It is so dry and hard it may be carried in the pocket without injury or thought of its soiling anything with which it comes in contact. Almost every particle is digestible, and its analysis shows it to be extremely rich. Unfortunately, there are very few offshoots of this variety

Mr. Dudley and a Bunch of Riverside County Boosters with Fig Trees in Background.

At the Right the Large Group is Made Up of the Attendants at the County Chamber of Commerce Meeting at Indio and Thermal. This Was Taken on Mr. Johnson's Place and Three of the Palms Are Loaded with Dates. The Other in the Foreground Bore an Immense Crop Last Year.

might not underlie those lands. At that time it was the writers' pleasure to visit that desert country—and it was indeed a desert—but the wells which were being sunk almost in a day were working wonders. The drilling apparatus was almost entirely of the hydraulic type, and once started the pipe with the water pressure would force its way so deeply into the earth that soon the freshest, coolest and finest water on earth was coming to the surface. "But the desert is hot?" Very true, but this heat insures some of the earliest and most profitable crops of any section of the world. This has brought into the valley a most enterprising bunch of Americans to develop a little empire.

believe the one that secured the largest attendance.

At the evening meetings in Thermal the church in which the meeting was held was packed. There was discussion as to community needs and means of obtaining them. Of course there was music by local artists and it was well rendered.

Preceding the evening meeting the cordial hospitality of the people of the valley was shown by an automobile ride tendered all visitors. We were taken to the ranch of Mr. J. H. Northrup who has 40 acres in bearing date palms. Mr. Northrup is a believer in the seedling palm, and the best of it is these palms are bearing at from three to four years of age

Upper Picture Shows Mr. Northrup's Incubator or Ripener. Lower is Mr. Johnson, a Pioneer in Date Culture.

of date to be secured in Africa and the only hope of large increase is through production of seedlings.

As noted above, the Coachella Valley people are some enthusiasts. The ladies of the valley showed their enthusiasm and hospitality by providing for the visitors a quail dinner which was in reality a banquet. In addition, at almost every turn on the trip during the afternoon date tarts or date fruit or delicious drinks were dispensed to visitors. These were so thoroughly enjoyed that the ladies were asked to give to Cultivator readers formulas for cooking or preparing dates for the table. Recipes for these may be found on the household page of this issue.

The next meeting of the chamber of commerce will be held at Elsinore in December.

Cooperative Fruit Marketing

Address Before the 46th State Fruit Growers Convention
By H. G. Johnson, President of the State Farmers Union

FOR the purposes of this paper farm products may be divided into two classes: perishable and non-perishable; each class presenting its own problems. I will consider only the non-perishable products, the marketing of which continues during the whole year; and will touch upon some of the points involved as far as time will permit.

The United States government has at last awakened to some extent to the gravity of the situation, and the businessmen of the small cities of California are exerting every effort to improve conditions, so that it is hardly necessary to argue that there is some-

thing radically wrong and that improvements should be made. My conviction is that cooperative marketing would overcome a great many of the present ills, even if it did not wholly solve the problem.

The enthusiast expects phenomenal results at the outset, not realizing that his organization is a new one which must establish confidence, work up business and overcome one thousand and one other difficulties, just the same as any other new enterprise; and when his expectations are not fully realized at once he becomes first discouraged, then indifferent, and finally withdraws from his organization.

Some believe that we must deal direct with the consumer, without a distributing organization. This idea is erroneous and it has rarely been accomplished in any line. When the consumer has been reached by the producer as in the case of the Standard Oil Company and a few others, they have a complete distributing organization which has been established at an enormous expense. I have listened to arguments where the speaker believed that we could market our raisins, prunes, oranges, etc., by parcel post; but when asked what kind of an equipment Uncle Sam would need, he replied: "That is up to Uncle Sam." The obstacle to such an

arrangement is the cost of transportation. The housewife who buys in small quantities will not send across the continent when her corner grocer can supply her even at a greater cost. So in time the producer who cannot carry out his pet idea of "Producer to Consumer" also withdraws from his organization.

There is another class of farmers that is opposed to cooperation because the full amount of cash is not forthcoming at the time of delivery. It is this class that keeps alive all the speculation and gambling in farm products. It must be borne in mind that when a man or corporation is

Fruits

FUMIGATION

Written for California Cultivator

By G. W. Waterbury

UNQUESTIONABLY predacious scale insects cause more rapid deterioration of citrus groves than any other one factor. Other factors are important and in time will cause loss of strength to the trees and financial distress to the owners, but the depreciation, to my mind, comes first through the work of the various scale insects.

We know that certain scales will kill the wood and that all degrade the fruit, and as the sap is lifted by millions of almost microscopic insects from the sappy veins of the tree loss of nutrition takes place, and no matter how well cared for the ground the trees deteriorate. The symptoms are those of a hen covered with lice; there is barely enough energy left to support life, leaving little for productivity.

Realizing the need of scale eradication the pertinent question is how to control it economically. The ideal way would be to let other insects war upon those at variance with the interests of mankind. This has been thoroughly tested and found unsatisfactory; the warriors do not work as fast nor multiply as rapidly as the thrifty armored scale insects. Artificial means must then be resorted to to save the trees.

Citrus trees are host mediums for destructive insects in proportion to the amount of sap running in the tree during the entire year. Thus the lemon and pomelo are the best liked by the scale family. Spraying would be the ideal way of killing scale were

it not that the citrus trees are always foliated.

In considering the scale question orchardists should get certain fundamental points firmly fixed in their minds; namely that every planting of citrus trees attaining commercial importance in every portion of the world eventually becomes infested with some kind of injurious insects; that once infested the orchards are never entirely freed from all scale of a destructive nature; that the best formula for attacking such insects should be firmly held to until the inventive genius of mankind clearly proves, and proves beyond question, that a new method is more sure of better results.

From checks made by Mr. de Ong in spraying citrus trees this summer it was found that but 50 per cent of a kill resulted. As efficiency is always a matter of percentages a kill of but one-half or even two-thirds is of little merit. By the cyanide process over 95 per cent are killed and this is not enough to carry the trees for two years with safety in lemon and pomelo orchards.

The all important question before the practical fumigator today is that of hatch and resistance. Should the black scale, for instance, change its time of periodic breeding so that the young do not all come out in the fall, but tend to overlap, then orchardists in the black scale districts will be forced to fumigate more often, an added expense to an already overcrowded yearly budget.

Then in some districts comes the question of resistance. The scale is not as easily killed as it was some years ago, and this in spite of the fact that fumigation and spraying are more

carefully practiced than formerly. Fumigating machines are delivering more accurate amounts of cyanogen gas to each 100 cubic feet of space under each tent; the men are better trained for their work and tents are more often inspected and the details of the work far better looked after than occurred a few years ago.

Of all the scales the red, when developed on the fruit, is unquestionably the hardest to kill. This is so in the Corona district where the red is gradually driving out the black; taking possession of the entire field as it were. Groves that once become thoroughly infested are many years in recovering, and one to two fumigations a year are necessary to preserve fruit wood.

Similar results are also noted in spraying where constant application of the different oils fails to bring the same results after some years of trial on citrus trees. While the cost is great, yet unquestionably it pays the orchardists well to fumigate when it is time. By this I mean by careful supervision to know just what the scale is doing all the year round. It is my experience that chronic infestation, resulting from stretching the interval between fumigations to too long a period, is quite similar to any chronic illness to which a doctor might be called to prescribe for a human being. In other words "an ounce of prevention is worth a pound of cure" applies to fumigation as well as to other affairs in life.

To the experimental station officials should be left the all important work of checking up on any and all new developments in scale eradication work. They have the time, the knowledge and the scientific instruments for thorough work, and if they do not devote a certain amount of time to the practical side of fumigation work they are neglecting a phase of citrus work which is costing the growers more money and more mental distress than any other at the present time.

There is a project now being started for the securing of a packing house in Turlock to handle the dried fruit product of the district.

LEMONADE

Some weeks ago the Cultivator made extensive reference on editorial page to lemonade and its disappearance from the bills of fare of practically all soda fountains and made comparison of its healthfulness over other drinks which are largely advertised. This called for comment by Mr. Henderson of Riverside, as follows:

"In the issue of the Cultivator of September 30, in your editorial on 'Lemonade', you wonder why so much more of a certain advertised drink is sold than lemonade. The answer is easy. The above-mentioned drink is sold at five cents, while lemonade is never less than ten cents and oftener fifteen cents, on account, dealers say, of the extra labor of extracting the juice and the cost of sugar. If the by-products companies connected with the California Fruit Growers' Exchange and other extract houses will put up pure lemon juice in earthen crocks or kegs and sell it to soda fountains at a price that will enable them to make a profit at five cents your problem is solved. The present price of lemons ought to make this commercially possible."

This induced us to take up the matter with the California Fruit Growers' Exchange and with the Fruit Growers' Supply Company which is largely interested in the citrus industry. From them we have the following:

"There is no question but that the use of lemonade is greatly restricted on account of the trouble and expense of making it at the stands, which causes them to put a higher price on it than for other soft drinks. If it were possible to put out a bottled lemon juice this would overcome the difficulty to a considerable extent, but to date no one has discovered a way to bottle lemon juice that will keep, although the government laboratories, the state university and many private parties have been experimenting with it. There are some properties in lemon and orange juice not present in grape juice, pineapple juice, etc., that preclude its keeping in its natural state. Sterilization at a temperature neces-

Stop Losing Money

If your clipper
bruises an
orange's skin you open the way
to decay. The cut may be too
small to notice—one decaying
orange may spoil an entire box.

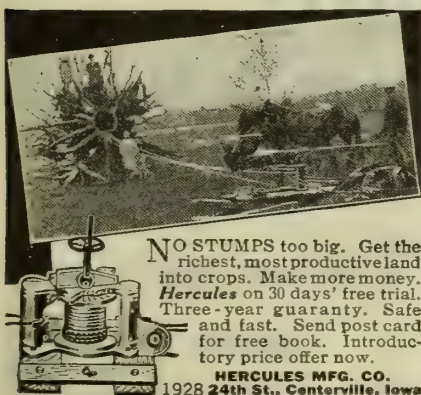

You won't bruise fruit if you use WISS ORANGE CLIPPERS

The blades are specially curved and ground;
the points and outer edges are rounded to
avoid bruising.

U. S. Government experts and leading citrus
growers everywhere endorse Wiss Orange
Clippers because they last longest, do best
work and save money by minimizing the
liability of bruising the fruit.

sary to overcome this gives the juice
a burnt taste, and where these mat-
ters have been removed by sufficient
defecation, this has also removed the
coloring matter and everything else
that would make it look and taste like
lemon juice.

"Someone, undoubtedly, is going to
work this out, and we believe there are
great possibilities in an orange and
lemon juice proposition whenever the
juice can be put up in its natural state
so that it looks and tastes like a fresh
product, and will keep."

We hope this will lead to a general
agitation of the subject. It may be
that the lemon juices which are being
processed at several establishments
handling waste products of citrus
orchards will prove satisfactory to
soda fountain people. If so there is
no reason why this most healthful of
all drinks should not be given more
prominence, but even if the prepared
juices are not acceptable there would
be no great amount of labor involved
in the preparation of each day's sup-
ply of the fresh juice, thus inducing
greater consumption of lemonade.
This would benefit the producer and,
still more, help to change the "drink-
ing" habits of many who may find a
more satisfactory drink in pure fruit
juices.

SPRAYING TO PREVENT BROWN ROT DECAY

The brown rot, as is well known,
is due to a fungus that lives from
year to year in the soil, and when
long periods of rains and humid
atmospheric conditions occur the
fungus is able to multiply sufficiently
to infect the fruit. This is thought
to occur principally by the splashing
up of spores in the rain drops from
the surface of the soil or by first get-
ting on fruits that touch the soil.

Our suggestion would be:

To gather all the affected fruits at
any time under the trees or that are
rotting on the lower limbs and either
haul them off and destroy them or
throw them in the middle of the row
where the sun can dry them out. The
brown rot fruits should be gotten out
from under the trees not only to avoid
increasing the amount of brown rot
for next year, but to avoid a possible
increase of gum disease, as it is now
known that the brown rot fungus also
causes the gum disease, especially of
lemon trunks (not the scaly bark gum
disease of oranges), when the soil is
excessively wet or piled too high
about them. This is true particularly
of heavy soils.

Every fall before or soon after the
first heavy rains and after fumigation
if possible the ground under the
trees, the lowest branches if they
touch the ground, and the trunk may
be sprayed with Bordeaux mixture
(about a 4-5-50 formula), to prevent
infection from the fungus. If the soil
or vegetable mulch has piled up too
high against the trunk this should be
pulled away for a short distance so as
to allow the spray to get down as far
as the top of the first main roots and
to allow the bark to dry out between
rains. This will avoid most of the in-
fections of gum disease which often
occur during the winter and spring
rains and do not show above the soil
until two or four months later. This
applies especially to low budded
lemon trees on heavy soils, but may
also apply to orange trunks to some
extent. Where the soil is particularly
heavy and the trees are subject to
brown rot gum disease it is often ad-
visable to paint all the trunks with
Bordeaux paste in the fall before the
rains come on to prevent gum disease.
Formula for Bordeaux Paste

Dissolve one pound bluestone (cop-
per sulphate) in three quarts of water
in a wooden or earthen vessel. This
can best be done by hanging it in a
sack at the surface of the water.

Slake two pounds unslaked lime in
about three quarts of water.

Stir together when cool, making a
light blue mixture the consistency of
whitewash. If the mixture turns to
some other color before being applied
it is an indication that something is
wrong. Mix up fresh each day or two
as the mixed paste tends to deterio-
rate. It may be applied with a large
brush like whitewash.

This may also be used on healthy
bark as an additional preventive.—By
R. S. Vaile, Asst. Prof. Orchard Man-
agement. Adapted from Work of R.
E. Smith, H. S. Fawcett and others.

Pacific Fruit Picking Bag

THIS bag is designed
specially for the pick-
ing of easily bruised
fruits.

It holds about one-half
box of oranges, lemons, or
fruit of similar size.

In the upper end of the
bag is a strip of canvas ar-
ranged to interrupt the
dropping fruit and to
break its fall.

The use of this bag in-
sures non-bruised fruit.

HIGH STANDARD FOR CALIFORNIA WALNUTS

Written for the California Cultivator
By J. G. Berneike

WITH the growth of the walnut industry in California it has become necessary to raise the standard of the merchantable walnut lest the consuming public should be found unwilling to buy the increasing supply, for it is plain that the demand for an inferior article would soon find its limit, whereas the supply of California walnuts is yearly increasing because of increased acreage and bearing surface of trees.

Therefore the aim of every walnut grower must be to produce the best of walnuts—which would form a story by itself—and to take such good care in harvesting that only good nuts shall find their way to the consumer. For when the consumer buys a walnut he "buys a pig in a bag." The grower must see to it that the pig is the kind that the consumer wants. The housewife who has bought a pound of California walnuts must not find reason to become disgusted with them because a large portion is bad.

Realizing this as an important factor affecting the entire walnut industry of California, the associations have set a high standard on their output of walnuts. The soft shells must stand a cracking test of 85 per cent, and the budded nuts must test as high as 90 per cent.

When the grower arrives with his load at the door of the packing house the foreman cracks a sufficient number of his nuts to satisfy himself that

the load is likely to average according to the requirements of the test. If the test can not be passed the grower is requested to take the load home for resorting. If resorting fails to bring them up to the test they are accepted as off-grade or as culls, as the case may be, and disposed of and paid for accordingly. If the load passes the test, the walnuts are taken in, graded, bleached, culled and dumped in bins to dry, after which they are sacked and loaded on the cars for shipment. A final cracking test is made of each carload, and if it fails to come up to the guaranteed standard it cannot be shipped out under the association brand. The Diamond brand of the California Walnut Growers' Association on a sack or package of walnuts is a guarantee to the buyer that the average of the nuts comes up to the standard test and will often exceed it.

Quite recently, while walking along Broadway in Los Angeles, I saw exposed in a fruit store, which seemed to have otherwise fine fruit, a sign like this: "New 1915 crop walnuts, 10 cts. a pound." As I looked at them I saw that they were culls. At 10 cents per pound they could be nothing but culls, such as one of my neighbors sold to a peddler at three cents per pound. Who ever buys them will become so disgusted with walnuts that he will want to buy no more of the 1915 crop. Had they been properly and correctly labeled: "Cull walnuts, 10 cts. per lb.," the customer would not expect good nuts and would not become disgusted, but would probably call for good quality walnuts the next time and be willing to pay the right price for them. It may be within the jurisdiction of cities to establish a

standard for walnuts to be enforced by the food inspector.

The question is: What can and what must the grower do that such walnuts may not reach the market to spoil future sales?

The only proper remedy that suggests itself to my mind is that the grower shall not sell his culls unless he is assured that they will be cracked and sold as walnut meats. Therein all growers must cooperate because the sale of cull walnuts as good walnuts to the unsuspecting consumer would soon limit consumption.

APPLE ANTHRACNOSE

This disease is known to occur on the Pacific Coast west of the Cascade mountains in Oregon, Washington and British Columbia, and has more recently been reported in the south central part of Washington and British Columbia, also. Frequently it is the matter of inquiry by orchardists in the eastern and central parts of the state. In order to acquaint the grower with the nature of the disease, its effects, and methods of control, the following statement is issued by Mr. D. C. George, assistant plant pathologist of the experiment station at Pullman.

Apple anthracnose, or black spot canker, manifests itself as a twig and branch canker on the apple and pear, and as a storage rot on the fruits of the apple and quince.

The twig and branch form appears as dark colored, sunken areas or cankers in the bark of the younger growth. It is especially injurious on branches under two or three inches in diameter, only occasionally being found on the thick bark of the larger branches. Frequently several of these cankers coalesce and completely girdle the branch. Young trees are sometimes killed by this girdling.

The young cankers begin their development in the fall, usually about the first of November. They appear on the bark as small, circular spots, reddish-brown to black in color. Beneath these spots a water soaked appearance is noticed, which extends to

the cambium layer. During the winter months development is retarded but becomes vigorous with the renewed activity of the host in early spring. As the spots enlarge they become elliptical in shape, more or less depressed and smooth, and the bark dries and slightly cracks at the advancing edge. The cankers are mature in size by the last of June or a little later and vary from one-quarter of an inch to six inches in length by one-quarter of an inch to five inches in width. About this time small elevations or pustules, more or less conical in shape, appear in the cankered area. Later, about midsummer, these pustules crack open and expose the spore-bearing mass of fungous tissue. In the late autumn the cankered area is separated from the healthy tissue by a slight ridge due to the formation of callus. When the canker becomes old, usually the second year, the bark cracks away from the edges, becomes loose and drops out, leaving unsightly scars.

As stated previously, the disease is known to cause a storage rot of the fruit. It first appears on the surface as small, light brown, circular spots of rotting tissue. These spots generally enlarge and later change to very dark or black, eventually becoming dry, depressed, and rather tough. Pustules similar to those formed in the cankers soon develop, quite commonly making their appearance in concentric circles.

Anthrachnose is caused by a parastic fungus known as "Neofabraea malicorticis." It produces two kinds of spores or reproductive bodies. The summer spores, or conidia, are formed during the first year of the development of the canker. They are mature by late summer or fall and are ejected in a gelatinous mass from each of the small pustules found on the cankers. These spores are readily separated by water, rain, dew, or certain summer sprays serving as agents in this respect. On being liberated they are scattered by various agencies and each one is capable of producing a new infection.

The winter spores, or ascospores, are developed the second year, within small, club-shaped structures borne

—WHY NOT START RIGHT?

You can plant a tree only once

A mistake in Variety can be cheaply remedied by grafting, but a mistake in root or method of planting can be corrected only by pulling up the tree and replanting with another. The particular hardy, rapid-growing strain of Royal root used by us cannot be purchased elsewhere.

Our Franquette, Mayette and Eureka

Walnuts

bring the highest prices paid for walnuts. The quality of our grafted stock then is not a matter of luck, but the result of ten years of experiment and selection. Catalog and price list on application.

Imperial Walnut Nursery
R. F. D. 7 San Jose, Cal.

in disk-like bodies that occupy the position of the pustules of the previous season. Following the fall rains these spores are discharged with force and are carried away by the wind. Like the conidia, upon germination, they are capable of producing new infections.

It has been found that conidiospores are also developed from old layers around the edges of the pustules producing the ascospore stage and also in the bark of cankers three years old. If the bark drops to the ground at the end of the first year, the winter spores may be developed in such bark on the ground.

Thorough spraying and pruning are essential in order to control the disease. The spraying should be done immediately after the fruit is picked, as at this time the spores are most abundant and new infections most likely to take place. The 6-6-50 bordeaux is recommended. If the fall rains begin early and the trees are harboring old cankers, an additional spraying, about three weeks later, is advisable.

Too much emphasis can not be placed on thorough pruning. It is advisable, where possible, to do this before the first spraying. All small twigs and branches showing any signs of the disease should be removed. Old cankers on the larger branches should be cut out without fail as they are very serious sources of spore production, and the wounds should be protected in order to keep out wood-rotting fungi and insect pests. The cut edges of the bark and the cambium should be painted with shellac and as soon as this dries the entire wound may be covered with coal tar or any good paint. The prunings and all bark removed from the cankers should be burned.

FAILURE TO SET FRUIT

The question is often asked as to why so many trees blossom fully, then fail to produce any fruit. Among the reasons which may cause this are:

Self-sterility, that is, many fruit trees have blossoms which are not capable of setting fruit properly unless the pollen from another variety is used. For instance, the Bartlett pear does not set fruit so well if planted alone as with other pear trees blooming at about the same time. Another reason is that pistils of the blossoms may be injured by cold. The cold may not be sufficient to destroy the flower, but the delicate pistil is injured so that there is no possibility of the pollen developing the fruit. Weak trees, those weakened by insects or diseased conditions, may bloom heavily and have insufficient vigor to set the crop.

Rain or severe electrical wind is another cause of barrenness if coming at a certain time in the blooming process.

Excessive wood growth which may be caused by an overabundance of nitrogen fertilizers or by very severe winter pruning may cause blossoms to drop, for if the tree is forming an excessive amount of wood at blossoming time it seems to cause the loss of the fruit.

Heavy spraying at blossoming time on some varieties of fruit may prevent the pollen from fertilizing the blossom, and this will cause complete loss.

Then of course there are diseased buds, depredations of birds, lack of bees to carry pollen, and other factors to be considered.

CITRUS GROWERS' CONVENTION

Dr. A. J. Cook is making arrangements for a special citrus fruit growers' convention to be held in connection with the National Orange Show in San Bernardino late in February. Definite plans are not yet made, but an effort will be made to secure some of the best qualified speakers on citrus subjects, and cultural and economic questions will have consideration in this convention.

Raw cotton now commands almost twice as high a price as it did at the commencement of the war. This increase is almost entirely due to the prospects of a very light crop for the coming year.

Bean Power Sprayers

Bean Giant Duplex

—a power sprayer that has carried the fame of the Bean line around the fruit-growing world. Supplies 2 lines of hose at high pressure. Capacity of 5 to 7 gallons a minute. We make power sprayers at from \$100 up.

TEN DISTINCTIVE BEAN FEATURES

1. Patented Pressure Regulator.
2. Patented Threadless Ball Valves.
3. Porcelain-lined Cylinders.
4. No Stuffing Box.
5. Eccentrics Instead of Cranks.
6. Underneath Suction.
7. Bean Quick Refiller.
8. Rocking Bolster.
9. One-piece Steel Frame.
10. Reliable Novo Engine.

The California Cultivator

Weekly—24 to 32 Pages One Dollar per Year

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department. Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Contract

B buys five acres of land on contract, paying \$250 down, the balance on time. Now I understand that if B has contract recorded he can stay on property one year, some say 18 months, and that A cannot take any of the crops that B may raise or dispossess him immediately. How long can B remain on land? B also rents piece of land from A, paying A with one-fourth of crop. B does not pay interest or the payments when they fall due, but has contract recorded. Can A take crop on land rented?—Subscriber.

A man holding such contract should always, for his own safety, have it recorded. When such contract is recorded it constitutes a cloud upon the title and it is necessary for the vendor to bring suit to have the contract cancelled in accordance with the provisions thereof, or to enforce its specific performance. There is no particular time limit within which the vendee who does not comply with the

conditions of the contract may remain upon the property, as it is entirely subject to the expedition with which the case may be put through the courts. Usually at the time of judgment being given the court will allow the vendee to make up the full payments, but this matter is within the discretion of the court. As the second parcel of land is a plain rental proposition and is an entirely separate transaction from the contract, the vendee can take no action thereon which is not based entirely upon the rental contract.

Bill of Sale

A party offers to secure me for money due me by giving me a bill of sale to his team and wagon, but wants to retain the same to do his work with. Would they be legally mine if I do not have them in my possession?—Subscriber.

A bill of sale is perfectly valid between the borrower and the lender, but unless the team and wagon are transferred to the lender the contract is voidable as to creditors of the borrower.

Pasturage Not Paid

What must I do to acquire title to a mule which was left for pasture at my place over a year ago? Pasturage was to be paid monthly, but up to date nothing has been paid and the owner has left this part of the country without leaving any instructions whatever.—Subscriber.

The only safe way to finally determine and foreclose the ownership in the mule under the circumstances is to bring a suit in the justice's court

of your township for the amount due for pasture and thus foreclose the lien which you have upon the mule. In view of the fact that you cannot find the owner of the mule you would be entitled to publish summons and acquire jurisdiction in that way. If it was possible for you to find the owner of the mule and give him actual notice of the time and place of sale, or if the owner of the mule had waived his right to such notice in writing, you could proceed to acquire title to the mule by sale at public auction without the necessity of a suit.

Trespassing Cattle.

A has baled hay surrounded by barbed wire corral and outside that a large wire netting corral. B's cattle in his absence ranging on A's unfenced land (without permission) break into A's corrals and eat most of A's hay. Can A for his own protection shoot cattle, not seriously injuring same? Having no means of holding cattle or feeding and watering same in corral pending B's return must A continue to stand for above breaking into his corrals and houses?—Subscriber.

The only recourse which A has is to bring action against the owner of the cattle for damage caused. If he estimates his damage for more than \$300 he may bring a suit in the superior court and have the sheriff take charge of the cattle pending the outcome of the suit and as security for the judgment which he may recover therein. Grounds for the obtaining of a permanent injunction against the owner of the cattle is stated in the question; the violation of the injunction would mean a term in jail for the owner of

the cattle. A has no right to shoot, injure or poison the cattle.

Cattle Poisoned.

A puts out poison on his own land for coyotes which are eating his chickens and turkeys. If B's cattle, ranging without permission on A's unfenced land, are poisoned, what recourse has B?—Subscriber.

If the cattle should eat poison set forth A might be held liable for the value of such cattle.

Community Homestead

In commuting on homestead after 14 months' continuous residence, what amount of cultivation is required? If homesteader relinquishes part of holdings for actual pro rata amount of what filing cost him, can he later take up another similar amount of contiguous land without waiting for final proof? In figuring actual amount as above can he figure attorney's fees for filing and charge of filing or only government fees?—Subscriber.

The provisions of the act permitting a homesteader to take up contiguous land do not apply to anyone who relinquishes his first entry for a valuable consideration in excess of the filing fees paid by him upon original entry. Filing fees mean those actually paid to the government. There has been no change in the law relative to cultivation of land upon commutation.

AVOCADO SCORE CARD

Suggested score card recommended for fairs or contests of avocados by Prof. I. J. Condit.

Size (uniformity), 10; form, 5; stem, 2; skin, 33, divided thus, color, 10; finish, 5; surface, 6; freedom from blemish, 12. Flesh, 40, divided thus, color, 5; thickness and amount, 10; flavor, 5; texture, 5; quality, 10; freedom from fiber, 5. Seed, 10, divided thus, size, 8; condition in cavity, 2.

Size. Avocados may be of any size from small, two or three inches in diameter to large, five inches or more. Medium sizes are most desirable, those weighing from three-quarters of a pound to one and one-half pounds. Sizes should be uniform among the fruits of any one variety submitted for exhibit or judging.

Form. Fruit must have shape typical of the variety. Round and pear-shaped fruits are more desirable than bottle-necked or elongated.

Stem. Stem should show a smooth cut. It should be well set and firm. Deduct one point for each missing stem.

Skin. Color should be attractive, whether green or purplish-black. The skin should have a good finish, glossiness and clearness of color being desirable. The surface need not be perfectly smooth. Warty or exceedingly rough fruits should be discounted. Fruit should be free from blemishes, such as cracks, wind scars, or abrasions.

Flesh. The flesh should be of a good butter color, with very little green near the skin. The largest possible amount of flesh is desirable. The flavor should be rich and nutty, the texture soft and buttery, and the quality as high as possible. The less fiber the better.

Seed. The seed should be small and tight in the cavity.

THROWING OUT BUOYS

On board a ship one day the cry went up: "A man overboard!" and the captain gave orders to a new sailor, who was an Irishman, to throw out two buoys.

The sailor, seeing two boys walking on the deck, threw them overboard. The captain, in a state of excitement, declared that it was cork buoys he wanted thrown overboard.

"Bedad, said Pat, 'how was I to know whether they came from Cork or Tipperary?'"—Chicago News.

BETWEEN GIRLS

"What are you reading so intently?"

"Balzac. I have to post up on Balzac because my beau is interested in Balzac. Don't you ever post up on the things which interest your beau?"

"I don't have to," answered the other girl. "My beau is interested in me."

In Every Line There Is One Supreme Authority

LEADERSHIP is gained by years of specialization on one line. This explains why the Firestone stands at the head of tires.

It is the product of supreme authority on tire making—the largest organization in the world devoted exclusively to the manufacture of tires, tubes and rims. Specialists at buying, specialists at building and specialists at distribution combine their resources on an enormous scale. You gain these benefits:

Firestone Tires with their Inbuilt Extras for "Most Miles per Dollar" and easy riding comfort—at these low prices. **Firestone Tubes**, with their bulk of pure rubber, their extra weight and quality—at prices lower than all other established makes.

COOPERATIVE FRUIT MARKETING

Continued from Page 483

willing to buy products enough to fill his warehouse, he must consider insurance, storage, interest, risk of decline, etc., at the time of making the purchase; and when the matter is all summed up the man who gets the ready cash has had it heavily discounted. However if the producer makes a good sale the speculator has likely made a poor purchase; and he will certainly make good on some other producer or go out of business; which he seldom does. The result is that someone must suffer for his good fortune, and one more link has been added to the chain of dissatisfaction.

We find any number of individuals and firms who are ready to sell six or eight months before the crop is harvested, even before the trees and vines are in bloom. This is the rankiest kind of gambling. It even puts the blush of shame on stud poker, for in that there is but one card buried, while in future selling the whole hand is out of sight.

One of the most serious results of speculative dealing is the influence on the market. The truth is that specu-

lation has more influence on the market than supply and demand. When these speculative influences are most active, there is, as a rule, no possible way of telling what relation the supply will bear to the demand. I am confident there would be a decided improvement should we establish true cooperative marketing; and I will set forth a few of the many reasons why it should be established. But I refer to genuine cooperation and not half-hearted endeavors, and I refer to practical cooperation and not idealistic theories.

The cooperator who knows his products are going to the markets of the world through his own organization would be much more particular about their preparation. He would take a great interest in the success of his own company, knowing that with good management his well prepared products would receive all possible benefits of market conditions and he would be relieved from the worry of the sale of his own crops. He would know that his products, with those of his fellow cooperators, would be sold over the whole season, and thus obtain the average price. He would also know that he would receive the same returns as his neighbor, quality being considered; and that also would be a great factor for contentment in his community.

Another important feature is the elimination of competition. To illustrate, let us suppose there are a thousand farmers and ten buyers in a community. If each of the buyers should call on each of the farmers but once during a season, there are 10,000 conversations. Each buyer influences to some extent each farmer, and that influence has more or less effect upon the market ideas of most of them. The result is the imposition of the buyers' views upon the community and the dissipation of the original views of the farmers; much to the disadvantage of the latter.

On the other hand, if there is one cooperative organization acting for all the farmers, the buyers have but ten opportunities for expressing their views, and that only to one as equally well posted on market conditions as themselves. There can be no misrepresentation and the inevitable result is a tendency to strengthen market conditions.

Cooperation also eliminates a powerful influence in weakening market prices in this way:

When individual selling is done each seller tries to dispose of his entire crop, thinking that his particular crop will have little, if any, effect on conditions; but at the same time there are hundreds of others doing the same thing, and before it is realized, half to three quarters of the year's crop is sold almost at the same time, and this usually results in a decline. To dispel any doubts concerning this, I might use this illustration: If you want to buy a horse and there are 20 sellers, you know you will be able to buy cheaper than if there are only ten. I think this makes my point clear.

The seller for a cooperative concern goes into the market, naming his price. He is in a position to hold the market steady for he controls the supply. The consumer need have no anxiety for, with true cooperation, there is no danger of prohibitive prices, because, as soon as such a condition existed, consumption would shrink, and the supply, whether visible or not, would exceed demand. Prices would be kept within the reach of the consuming public. This is necessary for the success of the producer, for to succeed he must sell all of his products. However he must of course dispose of them at a price that will reward him for his labors and bring him a reasonable return on his investment. In this connection he has the consumer more at heart than the dealer, even though it be from a selfish motive, for his investment is permanent and he wants his lands to be his life support, while the interests of the dealer are in the goods he may momentarily have for sale, and he gives no thought to anyone but himself. He makes what he can, knowing that the farmer will again fill his house the next year at his (the dealer's) price.

Should the cooperative movement raise the price of fruits, say one cent per pound, as it has done in the raisin association, what a difference it would mean to you. It means the dif-

ference between comparative ease and constant anxiety. And how little such an increase affects the consumer, even allowing the present profits to the distributor, is shown by the fact that on a basis of double the present per capita consumption of two of our leading dried fruit products, the increase would amount to only four cents per year per capita in cost of living.

It is a deplorable fact that under the present system of individual selling quite a considerable percentage of the farmers give only the minimum of attention to the preparation of their products for the market. In other words, they put them only in such condition that they will just pass inspection, and that is all. This we believe is due to the fact that they feel no responsibility after the goods leave their hands. The dealer finds he has inferior goods on his hands and he in turn passes them on because he has money invested in them and he must protect himself. The result is we have products of inferior quality on the market, and the inevitable result is decreased consumption; and in the end the sale of the perfectly prepared article is injuriously affected. Cooperative marketing would overcome this as these same farmers would prepare their products with the greatest care, keeping the inferior goods for other uses. The aim of the cooperative company would be to increase the general consumption of food products, thus adding to the general prosperity of the whole community.

One difficulty which the farmer encounters is obtaining exact knowledge of crop conditions. Most farmers spend their time growing their crops and are not in a position to get reliable crop data. The information given in local newspapers is often misleading, though probably not intentionally so. I have seen accounts in local papers just as overencouraging as the local buyers were unduly discouraging. A cooperative concern possesses reliable crop information and can act intelligently. The value of this knowledge cannot be overestimated. I do not want to be understood as stating that no farmers are posted, for the large farmer has enough at stake to justify his spending time and energy in obtaining information, and he does so. I am speaking of the smaller ones. At the same time I believe that cooperative methods are the best for all, both large and small farmers alike. Other vital information as to stocks in warehouses, the active movements or stagnation of markets, etc., would all be in the possession of a cooperative concern.

With regard to advertising, there is no question that the only kind that is of any benefit to the producer is cooperative advertising. The difference between ordinary and cooperative advertising is that the latter strives to increase the consumption of the commodity, whereas the individual advertiser is only concerned with his own particular brand. Both are selfish, I will admit, but the one giving the greatest amount of good to the greatest number is entitled to the first consideration.

If we listen to the enemies of cooperation they will tell us that what ails the present situation is overproduction. At the time of harvest we hear this argument until we dream about it; and how many times in our memories have we seen it disappear as soon as the major part of the crop was out of the farmers' hands. I tell you manipulation has done more to cause overproduction than the soil has. I will admit that sometimes there is such a thing as overproduction. But how much better the situation could be handled by cooperation. At such times only the best would be put on the market, and thus a fair price would be maintained, perhaps as much as would have been received for the whole crop were it all marketed, and we would then have the market ready to receive the next harvest. "What would be done with the surplus?" you ask. This is a gathering of farmers, and you and all fruit growers know that such surplus can be fed to work stock profitably or converted into meat.

In conclusion I may say that perhaps the best argument in favor of cooperation is the unrelenting war waged against it by speculative dealers.

Motorists! Cut Fuel Bills
Save 25% to 50% on Gasoline

GOMOR, the wonderful, scientific lubricant makes each gallon of gasoline do double duty. "Gomor" increases mileage 25% to 50% and lengthens life of motor by greatly reducing friction. "Gomor" is poured into ordinary gasoline and thus introduced into motor through carburetor with the gas. At every explosion "Gomor" is sprayed on the cylinder walls, pistons, valves, etc., reaching parts not sufficiently lubricated by ordinary method.

Make Car and Money Go Farther
by using "Gomor." One quart treats 80 gallons of gasoline. Use 1/4 pint of "Gomor" to 10 gallons of gasoline. Over one thousand severe tests of "Gomor" by leading auto engineers for past four years proves it will do all we claim.

"Gomor" Prevents Carbon Formations
because it lubricates perfectly and allows motor to run on very lean mixture. "Gomor" is backed by many of Detroit's leading business men. Big motor companies and thousands of satisfied users testify to its performance.

Your Satisfaction is Guaranteed or your money back
Price, \$1.00 per quart, delivered. "Gomor" really costs you nothing. It soon saves its cost. Order today or send for booklet, testimonials and sworn proofs.

Know Your Gun, Your Shells and Your Powder

OLD hands with the shotgun agree that success afield or at the traps depends to a great extent upon knowing your gun and your ammunition—knowing the whole range of their capacities, knowing how to get results with them. Every veteran shot has learned from experience that it pays to select them by careful test and comparison and to tie up for keeps with the make that gives the most satisfactory results.

In selecting your powder you can't go wrong when you get shells loaded with

Infallible Smokeless Shotgun Powder

Prove this for yourself. Try Infallible. Note its high velocity. Note its even patterns. Note its unusually light recoil. And finally, with repeated trials, note its unfailing uniformity in these qualities.

In addition, Infallible is water proof, weather proof, and age proof.

For a high score or a full bag buy loaded shells—Infallible loads. Your dealer can supply you in all standard makes of shells. Look for the name Infallible on the box and on the top wad of each shell.

Get our two interesting booklets. *Trapshooting*, illustrated on almost every page, is a book that will interest both beginner and veteran. *Hercules Sporting Powders* should be read by everyone who owns a rifle, shotgun, or revolver. These books are yours for the asking. Write today.

SELECT SEED CORN NOW

Written for the California Cultivator
By Sacramento Valley Contributor

THE corn growers of the states of the Middle West have very greatly increased their crops by selecting their seed corn with greatest care.

There is a big crop of corn in California this year and a very much larger acreage will undoubtedly be planted in 1916.

Right now is the time to be selecting the seed, if it has not already been done.

The heads or ears should be selected in the field so that not only the size and weight and general characteristics of the head or ear itself may be noted but that it may be selected from a vigorous, strong-growing, prolific plant.

The seed corn gatherer should have in mind an ideal type of the variety he is selecting. First of all it must be a big producer, then size and plumpness of kernel, and the arrangement of the kernels on the cob or in the head should have attention. When a particular type is selected all of the seed should conform as closely as possible to it.

As soon as the seed is gathered it should be stored in some place where it can thoroughly dry and remain so until planting time, and it should be so placed that it can be easily tested sometime before next spring.

A good way to store seed grain of the non-saccharine sorghum "corns", as they are called, such as Egyptian corn, Egyptian wheat, milo, feterita, etc., is to tie them in a row on a string and hang them along a wall or under a ceiling. Indian corn can be hung in loops made in two strings, one at each end of the ear. Ten or more ears can be "strung up" in loops in this way, and these can be hung along walls, from rafters or ceilings.

When the corn is to be tested, one or two kernels from each head or ear can be taken and placed on a plate or platter or pan in such a way that they will conform to the location of the ears or heads where they are hanging. The ears or heads represented by the kernels that do not germinate satisfactorily can be taken out and fed. If desired a second trial may be made before the discard is made.

The kernels will germinate readily if placed between moist cloths that are laid between pans or plates, and kept in a warm place.

But the important thing now is to get the seed selected and gathered at once. And if a neighbor has a better field than you have, and has a larger acreage than he is going to pick over for seed, see if you cannot get some of his corn from the field, doing the selecting yourself. If you have to pay him for it, it will be money well spent, but you may be able to trade with him on some fair basis.

The use of carefully selected seed of strong germinating ability is going a long way toward insuring the seed factor of the coming corn crop.

THE ELECTRIC BELL ON THE FARM

By L. S. Foltz of Colorado Agricultural College

IN establishing an electric bell system it is advisable to use a central battery for the supply of all circuits. The economy of this is apparent.

Suppose that four circuits are to be established, a front door, a barn, a granary, and a field. To operate the first requires two dry batteries, the second four, the third six, and fourth, ten. Total batteries required, 22. If a central battery supplies all circuits only ten dry batteries will be required. The saving on 12 batteries is about \$3.00. The first two circuits should have their resistances increased to about that of the field circuit so that the ten batteries will not send too much current through them. This can

be done by the insertion of coils of fine, insulated iron wire.

From the terminals of the battery bring two leads to a single throw, double pole switch with which to control the circuits. One end of each ringing circuit should now be connected to one pole on the side of the switch opposite to the battery connection, and the remaining ends of each ringing circuit should be connected to a bell and the bell to the remaining pole of the switch.

All wire inside the building should be annunciator wire. This may be fastened to the walls with small staples driven in only far enough to lightly pinch the insulation on the wire. The wires should leave the house from a concealed place, and if possible be laid in iron pipe a few inches from under ground to the building desired or to the nearest fence leading in the right direction. The wires should leave the pipe by way of a double elbow turned down to shed moisture. The wires within the pipe may be "twisted pair" which is composed of two insulated wires twisted together. If the pipe line is led out to a fence, bring up the end of the pipe by a post and carry up the wires to the fence wires and solder the joints. Whether the fence posts be iron or wood the staples fastening the two fence wires to which connection has been made should be pulled out and wires wrapped at the staples with a small square of sheet rubber cut from old boots or rubbers, or a bit of oil cloth. In any case before wrapping the wire with the patch, dip the patch in linseed oil or oil paint. This will increase the insulating qualities and preserve the patch. Straddle the patch with a staple and drive it home to grip the patch firmly but not to cut into it. The kind of fence wire to which connection is made does not matter for it may be plain galvanized or barbed or woven or a combination. I have used with entire satisfaction a circuit, one side of which was barbed wire and the other side light chicken netting. The staples were not insulated but the weather was dry.

To get from the fence to the building proceed as from the house to the fence, bringing the circuit underground to the interior of the building. From the entrance point lead a pair of annunciator wires around the interior of the building, going above the windows and doors. To the points to be protected lead a wire from each of these annunciator wires and connect to the contactor devices.

The type of contactor will depend upon what is to be protected. An ordinary window may have the wires concealed in the sash strip up to about a foot above the top of the lower sash. The inside edge of the strip should be cut to receive a small strip of spring brass which normally projects into the sash runway. This tongue is soldered to one of the wires and the other wire is soldered to the head of a brass screw lying under the tongue. When the sash is raised the brass tongue is pressed back onto the screw, completing the circuit and ringing the bell. A sliding door or sash may be protected thus. Secure above the door in a horizontal position two strips of brass sheet. Have these side by side and connected to the wires coming down from the main circuits. Arrange an arm on the door or sash which carries a strip of brass which will bridge across the space between the two horizontal strips when the door is opened. This small strip should make good contact with the two long strips throughout the length of its travel, thus closing the circuit and ringing the bell.

A swinging gate may have on the post at the base of the gate a contactor arranged so that when the gate opens a little way the circuit will be closed. This contactor can be so installed that its presence is not revealed except by careful examination.

Now is the Time to Blast Holes for Spring Tree-Planting

BREAKING up the subsoil with dynamite before planting trees or vines has become a standard operation on progressively managed farms and orchards. You will get the best results by blasting holes now for spring tree-planting. The earth will then have a chance to settle and the compact subsoil will be disintegrated by moisture and air.

Trees planted with the aid of

HERCULES DYNAMITE

develop better and bear earlier than trees planted in spade-dug holes. This is because the shattered soil enables the roots to strike deeper for moisture. First year deaths are reduced to a minimum and often eliminated entirely.

Nor are these good results short-lived. A California orchard planted with dynamite over 20 years ago is still recognized as the finest orchard in the vicinity of La Mesa. Hercules Dynamite rejuvenates old orchards and gives vigor to unhealthy young ones. By breaking the underlying hardpan it removes one of the common causes for poor fruiting and growth as well as early dying.

There are other ways in which Hercules Dynamite can save you time, labor and money and increase your profits. Use it for boulder blasting, stump blasting, ditching, draining, controlling erosion, excavating, digging post holes, etc.

All the uses are clearly explained in our

GREEN MANURES ON YUMA PROJECT

The report of experiments conducted during the year on the Yuma Reclamation Project experiment farm, near Yuma, Arizona, shortly to be issued by the United States department of agriculture, devotes special attention to a discussion of the method of raising Durango cotton and also discusses alfalfa and sorghum culture in this region. One section of the report is devoted to Sudan grass, and there is mention of experiments with hemp, flax and broom corn.

The following advice on the use of green manures, taken from this report, should be of interest especially to alfalfa growers:

One of the most important values of alfalfa is its usefulness as a preparatory crop. It is the best green manure crop yet found when all phases of its benefits are considered. However, a stand of alfalfa is often difficult to establish on very light sandy areas or on spots in fields where heavy grading has exposed the sandy subsoil. Apparently the difficulty experienced in establishing alfalfa stands on these soils is not a deficiency of plant food, but a very irregular moisture content of the soil. This condition has been found to be most economically improved by the addition of a summer green manure crop of cowpeas. Cowpeas when planted in a good seed bed have produced on sandy soil approximately four tons of green manure per acre. Alfalfa may then be seeded in the fall and become established for the following season.

FORESTS ON WATERSHED NECESSARY

In 1911 an association of Colorado farmers who irrigated their farms with water from the North Platte River sent an urgent request to the government to restrict timber cutting on the North Platte watershed, so that as far as possible high spring freshets could be prevented and more water made available for irrigation during the summer months when the crops were most in need. They said that they relied upon the national forest, within which the watershed lay, to ensure a steady flow of water for their crops.

The national forests, besides being the American farmer's most valuable source of wood, which is the chief building material for rural purposes, are also his most valuable source of water, both for irrigation and domestic use. In the West they afford him a protected grazing range for his stock; they are the best insurance against flood damage to his fields, his buildings, his bridges, his roads, and the fertility of his soil. The national forests cover the higher portions of the Rocky Mountain ranges, the Cascades, the Pacific Coast ranges and a large part of the forested coast and islands of Alaska; some of the hilly regions in Montana and in the Dakotas, Oklahoma and Arkansas, and limited areas in Minnesota, Michigan, Florida and Porto Rico. In addition land is now being purchased for national forests in the White Mountains of New England and in the southern Appalachians. In regions so widely scattered agricultural and forest conditions necessarily differ to a great degree, bringing about corresponding differences in the effect of the national forests on the agricultural interests of the various localities. Wherever agriculture can be practiced, however, the farmer is directly benefited by the existence of national forests and by their proper management.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Shoe Boil

I would like some advice about a shoe boil, as I have not seen the ques-

tion asked or answered in the Cultivator. I have a fine mare that has a large shoe boil on the right leg or shoulder. Have tried ointment but it does not help it. Please let me know what is good for it.—Subscriber, Santa Rosa.

First you must tie the mare in the stall on the side where the shoe boil is so she will have to lie down on the other side, or wrap a pad of something soft around the foot so it will not bruise the sore. The pressure from the shoe is what is causing it. If it is soft in the center cut it open to let the pus out and wash out the pus cavity once a day with soap and warm water. Get the following liniment from your druggist and use it on the swelling. It will reduce it in a short time: Bichloride of mercury, one dram; alcohol, one ounce, and turpentine, one pint. Mix and apply once a day to the swollen parts.

Indigestion

For three weeks my cow has been decreasing in her milk and she will eat scarcely anything except beet pulp of which I give her a large amount twice daily. For two months she has had small festered spots on the udder, really not large enough to be called boils but they act in the same way. She is getting thin and seems to have a cold as her nose runs and she coughs at times. Tried giving her a handful of salts in the feed but she will not eat it. Please advise what to do.—Subscriber, Lancaster.

The cow should not be given too much beet pulp. Any cow will get sick on all fine feed. Ground grain, brewer's grains or beet pulp will not form a cud and the cow must have some kind of hay or corn fodder to form a cud. Give her a physic of aloin, one ounce; turpentine, two ounces, and raw linseed oil, one quart. Mix and give at one dose as a drench. It might be well to repeat this in a day or two. Then feed on rough feed until you notice her chewing her cud, after which begin feeding her small quantities of grain or beet pulp. The ulcers on the udder are probably cow pox and have nothing to do with the other trouble. Cow pox has been described several times in this column as you will find by referring to back numbers. The cow pox will probably disappear after the above treatment if you are careful to keep the udder clean and not break the blisters when milking or if you do then wash the parts clean and apply some good ointment.

Pin Worms

I have a mare that seems to grow thin although on good feed. I notice that she passes a few worms that are about an inch and a half long, white and tapering in shape. What can I give her to get rid of the worms and get her in better shape? Also have a six months old colt in the same condition.—Subscriber, Paso Robles.

Get the following medicine of your druggist: Aloin, one ounce; turpentine, eight ounces, and raw linseed oil, two quarts. Mix and shake well. Divide into eight doses and give one dose every day. Give the colt half or one-third the amount. If it physics either one of them do not give it so often. Follow this with a mixture of salt and wood ashes; one pound of the ashes to four or five pounds of salt. Give a large tablespoon of this in the feed once a day. If the worms continue after this treatment then make an infusion of tobacco by using a paper of scrap tobacco to each gallon of hot water. When cooled down to body temperature inject about two gallons into the rectum. Repeat this every day for a few days. After riding them of the worms they will probably take on more flesh without any farther treatment. Do not over-feed.

Hog Cholera

Pigs four weeks old have a cough and have sores or scabs on the head and neck which seem to be a kind of mange. After a few days are unable to eat. What is cause of this disease and the treatment for same?—Subscriber, Calxico.

Probably it is cholera. Your local veterinarian should be able to help you with it.

Pomona Deep Well Pumps

geles, California, as Second-Class Matter.**Thursday Nov. 18, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**WALNUTS UP**Owing to the output being
somewhat lighter than earlier esti-
mates and to the impossibility of the
French nuts reaching the market
early in the season, the demand has
practically cleaned up the supply.
However, for the crop yet in the
hands of the association an advanced
price has been made on two grades.
Number Ones have been advanced
from 13.6 to 14 cents, while budded
have been advanced from 17 to 17.5
cents.**CONVENTION WEEK**As we go to press the fruit
growers of California are gathering at
Visalia for their 47th state convention.
Also at Corvallis, Oregon, the State
Horticultural Society is meeting. Our
own state convention is to discuss
especially the question of marketing
fruits. Harris Weinstock, the market-
ing commissioner, is to be present,
and it is to be presumed that sugges-
tions will be made and possible action
taken which will lead to more profit-
able handling of our fruits. There
will be an especially strong effort
made to get cured fruit men into line
for a much stronger organization than
now exists.**BEAUTY PROPAGANDA**We have from Prof. E. J.
Wickson statement that he has asso-
ciated with himself a few earnest
Californians who desire to do some-
thing for the promotion of ornamental
horticulture in California. This is an
informal association of beauty lovers.
One of the features of its work is sup-
plying to various newspapers of the
state suggestions as to better and
more flowers, shrubs and shade trees.We wish it were possible for this
propaganda to take every one of itspupils—and we hope this means
every Californian—for a direct object
lesson to the grounds of the Panama-
California Exposition at San Diego.
California offers no more beautiful
landscaping than is shown there.**RECORD FOR BUTTERFAT**It seemed years ago that the live
stock breeder has reached his limit in
producing the greatest amount of
meat for the least feed and the great-
est amount of butterfat for the least
feed, yet month by month the record
is raised until now the record break-
ing dairy cow is producing more than
her own weight in butterfat annually.
Now comes the last world's record
breaker in a Holstein Friesian cow,
Duchess Skylark Ormsby, with a 365
consecutive days' record of 27,761.7
pounds of milk containing 1205.09
pounds fat. Of course this does not
equal the production of one of our
own California cows as to milk, but it
does surpass it in butterfat.

At the same time comes from the

introduced from Algeria and other
North African points where they
have been secured by the department
of agriculture and special agents sent
by the associations in the Coachella
Valley. The experiments have shown
many failures. They have also shown
that this is an industry entirely dif-
ferent from any other in California.For nine years Mr. Bruce Drum-
monds of the department of agriculture
has been in California making most
careful observations on the govern-
ment experiment station grounds and
on privately owned tracts. One hun-
dred different kinds have been tested
out. Many of these are, of course,
seedlings. In fact, some of the very
choicest of bearing palms are seed-
lings. Those now bearing are largely
chance productions. Now there is
being conducted a series of experi-
ments with seeds resulting from
hybridization, or rather from careful
pollenizing.Mr. Drummond has discovered that
by using pollen from the Phoenix
Canariensis, the ordinary ornamental**AN EXPLANATION**Some of our great family of readers may think \$1.00 a lot of money
to pay for the California Cultivator. As a matter of fact we lose money
on every dollar subscription. A little explanation of this will undoubtedly
interest you, because few ever stop to think of the work we do for that
small amount of money.Fifty-two times a year we send you a well printed and well edited
paper, containing as much of the news of the farming world as possible.Fifty-two times a year that paper is addressed and wrapped up; fifty-
two times a year we have to pay postage on that paper.Fifty-two times a year we must pay for the printing; fifty-two times
a year we must pay for editorial work, which is very expensive.Fifty-two times a year we must pay salaries of the office force that
looks after the publishing end. For all this, you contribute \$1.00.Your next thought is, how can it be done? It is not the subscriptions
that makes it possible to publish such a splendid paper as the California
Cultivator. It is a combination of subscription and advertising patronage.We have your interest in our subscription department, now we want
to get the same loyal support for the advertisers.We wish that every reader would realize that without advertising it
would be impossible to publish this paper at \$1.00 per year, therefore, it
is necessary that you bear these advertisers in mind whenever you can
use their goods. Give them the benefit of your patronage. We guar-
antee it will benefit you and we further guarantee that the more you pat-
ronize advertisers, the more advertising the California Cultivator will be
able to secure, and the more business of this character we carry, the bet-
ter paper we shall be able to give you. Give us this help and coopera-
tion. Look through our paper and see if there is some article advertised
in this very issue which will add to home comfort or increase farm
efficiency.Jersey cattle people the claim of the
world's record for continuous produc-
tion of one animal from the age of two
to the age of nine years. Her first
year's production, that is starting at
the age of two years and two months,
was 7,050.2 pounds of milk with 446
pounds butter. Her greatest year be-
gan at the age of seven years, 11
months when she produced 17,557.8
pounds of milk with 11,076 pounds of
85 per cent butter. The total produc-
tion of this cow, Sophie, was 75,920.8
pounds milk with 5,217 pounds of 85
per cent butter for six continuous
lactations. Hence the Jersey people
are claiming the world's champion
long distance dairy cow.**DATES**While we are producing more
peaches and some other fruits than
the market seems to crave, there are
other products demanded by the mar-
ket which have not attracted suffi-
cient producers. For example, with
almonds, figs, avocados and dates, we
need more to satisfy the market.
Great quantities of dates are now
imported and more would be if they
could be produced and packed under
American conditions. For several
years there have been a series of ex-
periments in Southeastern California
and Southwestern Arizona. These ex-
periments have called for trials of
suckers of the date which have beenpalm of California, with which to fer-
tilize some of the moister dates that
he secures a drier product and one
which ships and keeps much better.
Some unthinking planters have used
seeds from these dates and secured
plants of no value whatever. But by
using pollen from male plants whose
ancestry has been of strong bearing,
desirable quality seed is being pro-
duced from which much is expected.Fortunately the date bears young
and it is not long before fairly accu-
rate information is secured, and of
course about half of the plants are
pollen bearers and of no value except-
ing for the few which are required in
each plantation, and perhaps half of
the bearing plants will be of indiffer-
ent or practically no value. This
makes rather slow production, and yet
with the impossibility of securing the
required number of suckers from
date producing countries, it seems the
wiser way to produce orchards.We would not carry the idea that
date culture is on an assured profit-
able basis, under all conditions, but
for the man who can afford experi-
mental plantings and has land under
right climatic conditions with abun-
dant water there is great promise
in the date industry.The center of the industry at the
present time is the Coachella Valley,
regarding which there is a short
article on the third page of this issue.
Also on the same page there are a
few small engravings showing Cali-
fornia date palms, while on the cover
page is a view of a Coachella Valley
home, the latter used by courtesy of
Mr. Compton of the Coachella Valley
Submarine.**Agricultural Notes**There are Chinese chambers of com-
merce in New York, San Francisco
and Manila.Rains in Ohio have rather seriously
interfered with the sugar beet har-
vest and somewhat reduced the qual-
ity of the beets.Palestine has passed through a ter-
rible devastation by locusts. Probably
the orange and olive orchards have
suffered most, all foliage being de-
voured.China is planning universal educa-
tion. Its 40,000,000 children within
school age will require 400,000 public
schools, according to the minister of
education.An effort is being made to introduce
blight-proof coffee into the Philippines.
The coffee industry of the islands was
destroyed by the blight which swept
the entire East 25 years ago.In Canada 9900 hogs were slaughter-
ed by orders of veterinary inspectors
during 1914. These animals were
either infected with hog cholera or
had been in contact with the disease.
Compensation was paid the owners
to the extent of \$61,588.44. Canada is
certainly making a determined fight to
exterminate hog cholera.The demand for substitutes for ab-
sorbent cotton has been keen since the
beginning of the present war in Eur-
ope. The only substitute that has
found a large sale in Berlin is made
of pure pine cellulose. It can be pro-
duced much cheaper than cotton. It
is claimed that it absorbs blood better
than cotton, but is not so good as a
dressing for wounds.The 1915 orange crop in the Valen-
cia district of Spain is of excellent
quality but limited in quantity. The
fruit is generally sound and compara-
tively free from insect pests, while the
percentage of large sizes is high,
which is in marked contrast to last
season. In the important Alcira dis-
trict there is a noticeable shortage
over last year. Many orchards show
hardly a fifth of the usual production,
a large number about half, while near-
ly normal conditions prevail among
the majority.During the war much attention has
been devoted to potato drying in Ger-
many and with the assistance of the
government 240 new plants have been
established. It is thought that these
plants will find a good market for their
products even after the war on the
ground that the value of dried potatoes
as a foodstuff has now become known,
and that the potato bread will in con-
sequence be eaten not only during the
war, but afterwards as well. The ex-
tensive use of this product for cattle
feeding will, it is expected, also con-
tinue.All federal restrictions on the move-
ment of live stock because of the foot-
and-mouth disease in the states of
Indiana, Michigan and Virginia are re-
moved by an order signed by the sec-
retary of agriculture, effective October
9. With the removal of the quaran-
tine from these states the whole coun-
try with the exception of Northern Il-
linois, is now practically free. Two
areas in Steuben County, New York,
in Hudson County, New Jersey, and
the so-called "neck" in Philadelphia
are still under a modified form of
quarantine, however, and a part of the
West Philadelphia stock yards are in
the restricted area. With these excep-
tions, however, the quarantines which
were imposed as a result of the out-
break in 1914 have now all been re-
moved.

Agricultural News Notes

of the Pacific Coast

Northern California

Placer County has a 75 per cent crop of olives.

Stockmen are jubilant over the coming of the rainy season.

Sacramento County this year grew nearly 20,000 acres of beans.

The celery acreage in the delta of the San Joaquin is increasing.

Concord, Contra Costa County, is promised an incubator factory.

Durham, Butte County, has shipped 31 carloads of almonds so far this season.

A grower of Orland, Glenn County, reports the sale of 8000 sacks of barley at \$1.16½.

Fruit growers of Auburn have formed a cooperative association to market their fruit.

Lake County farmers are somewhat alarmed over the rapid spread of Johnson grass in their county.

More than 50 conventions are booked for the Panama-Pacific Exposition during the month of November.

The olive packing houses of Oroville are now started on their season's run. The olive crop is estimated at normal.

Some of the Butte County peach orchardists are discussing the advisability of grafting over their peach trees to varieties of shipping plums.

The fall wool sale held at Cloverdale the latter part of October brought splendid prices to the sheepmen, averaging 15 cents per pound. One sale was reported at 16½.

The Farmers' Protective Association of Sutter County named L. D. Baun its representative at the Fruit Growers' Convention, which is being held at Visalia this week.

Yields ranging from 70 to 125 bushels per acre of corn are being reported in the Delta region of San Joaquin County this year; most of the corn planted has been of the King Philip flint.

Farm bureau meetings will be held in Alameda County as follows: Monday, November 22, Newark Center at Newark, at 8 p. m.; Wednesday, November 24, Niles Center at Niles, at 8 p. m.

Sacramento Valley ranchers are showing much interest in the proposed fight against the water grass pest in rice fields, which is being suggested by the Sacramento Valley Development Association.

Alameda County has taken largely to early pruning, the majority of the apricot orchards having been already pruned. The question of winter spraying is being discussed at most of the farm bureau meetings.

Preliminary steps have been taken to organize the Napa County chamber of commerce. F. L. Alexander of St. Helena was chosen chairman of the temporary organization and Farm Adviser Baade, secretary.

The poultry show held in connection with the annual Butte County Rice Exposition at Gridley, October 30 to November 3, proved to be very successful and was the center of attraction for a large part of the visitors at the exposition.

Central California

Monterey bean farmers are getting good prices for their beans.

The Cured Fruit Association of Modesto has sent out several carloads of figs.

The orange crop of Kern County is now estimated at about 60 per cent of normal.

The California Associated Raisin Company has declared a dividend of \$408,000.

Prune growers of the Santa Clara Valley are holding together for a six-cent price.

At least 200,000 acres of lake bottom land will be sowed to grain in Tulare County.

Modesto has formed a branch organization of the California Peach Growers' Company.

California's milch cows are valued at nearly \$40,000,000 in the report of the state board of agriculture for 1914.

A cheese factory on River Terrace Farm at Hickman, Stanislaus County, sends out a ton of cheese every week.

Twenty-four hundred acres were planted to rice in Kern County this year. The prospects are for a good yield.

The Peach Growers' Company is still growing. Its plan of organization is patterned after that of the California Associated Raisin Company.

The streets about the raisin packing houses in Selma, Fresno County, are piled high with raisins which cannot be admitted to the crowded sheds.

The combined pack of the Visalia canneries this season is roughly estimated at 275,000 cases. Very heavy early shipments have been made.

The Kern County farm bureau will hold meetings at Shafter November 24 at 8 p. m.; Arvin, November 26 at 8 p. m.; Bakersfield, November 27 at 2 p. m.

More than 500 acres of beans are being harvested near Tulare. Most of the beans are blackeyes, though some experimental plantings have been made of limas.

Pearl of Venadera, the Jersey cow owned by Guy H. Miller of Modesto, was awarded the championship in the Jersey milking class at the Panama-Pacific cattle show.

The almond crop of Oakdale, Stanislaus County, this year is ten times last year's. Its value is estimated at \$100,000. Fifty of the growers have joined the Almond Growers' Exchange and organized a local branch.

The Kern County farm bureau will hold its annual meeting on November 27 in the county high school auditorium at Bakersfield. This will be an all day meeting beginning at 10:30. Election of officers for the coming year will be held.

C. E. Chambliss, in charge of the United States rice experiments, has been inspecting lands in the vicinity of Oakdale, Stanislaus County, and warning growers against too hastily planting rice before they are sure their conditions are favorable.

Southern California

Santa Paula reports practically all walnuts shipped.

A hog raising contest has been started in the Chino schools.

An orange packing house at Ontario was destroyed by fire last week with a loss of \$13,000.

A plan is proposed for the establishment of a cotton mill at Blythe, Riverside County.

The Santa Paula Walnut Growers' Association is receiving about 15 tons of walnuts per day.

Santa Maria, Santa Barbara County, has completed its bean harvest. Five cents is the highest price reported.

Santa Barbara reports many lima beans selling at \$4.50 and \$4.55 f. o. b. Many growers are holding for \$5.00.

At the last monthly meeting of the Ventura County farm bureau directors the organization of a county bean association was discussed.

Bean growers of the Camarillo district of Ventura County will meet on Saturday at 2 p. m. to discuss organization of a bean growers' association.

The lima bean crop in the immediate vicinity of Santa Barbara city is estimated at 85,000 bags; the crop of the Goleta district at 40,000; Carpinteria, 37,000.

There is a congestion of bean and walnut shipments from this state at Galveston, owing to the rerouting made necessary by the slides in the Panama Canal.

Heavy export orders for beans from England and France have caused considerable excitement among growers. Pinks and navies were both considerably advanced last week.

Imperial Valley is arranging for a big marketing convention to be held in Brawley early in December. The program is in charge of Walter E. Packard of the experiment station at El Centro.

The report of the San Diego Cow Testing Association for October shows that the dairy herd of E. M. Walker of Lakeside has the largest number of cows with butter fat production per month more than 50 pounds.

Hundreds of turkeys are being shipped from the Imperial Valley to the Los Angeles market. The Wells Fargo agent in the valley estimates that 30,000 turkeys will be sent from the valley for the Thanksgiving trade.

San Diego County farm bureau will hold local meetings at El Cajon, November 22 and 23; Otay, November 24; Potrero and Campo, November 26. The meetings at El Cajon and Otay will be held at 8 o'clock in the evening.

Nearly 200 citrus fruit growers of the Ontario section gathered at the Chaffee auditorium Saturday, October 30, to listen to a discussion of plant diseases and fruit blemishes, the meeting being conducted under the auspices of the Riverside experiment station. Dr. Fawcett, who is an authority on gum disease, was the principal speaker.

The Coast

The Arizona agricultural experiment station is advocating planting of garbanzo beans.

Cochise County, Arizona, has 33 silos, 21 of which were put in this year. All but nine are pit silos.

Owing to light rainfall in Klamath County, Oregon, this year much of the grain land will be summer fallowed.

Glendale, Arizona, will have a farm bureau meeting November 20; Tempe, November 24; Gilbert, November 26.

A large number of entries have been made for the Arizona Poultry Show to be held at Tucson December 16, 17 and 18.

Members of the Chandler, Arizona, Poultry Association have decided not to hold their show in January as planned.

The second week in October recorded a shipment of 533 carloads of apples from the Wenatchee district of Washington.

Sheep barns at the Phoenix state fair grounds have been remodeled. It is expected there will be a large number of exhibits.

Farmers of the Yuma Valley of Arizona are being urged by shippers to plant more cantaloupes and watermelons next season.

Farmers of Minnidoka County, Idaho, are saving their grain for feed, expecting to make bigger prices from the grain on the hoof.

Farmers at Sunnyside, Washington, received \$11 per ton for canning tomatoes this year. The average yield is estimated at 14 tons per acre.

The Pacific International Live Stock Show will be held at Union Stock Yards, North Portland, Oregon, December 6-11. Entries close November 27.

Farm Adviser James A. Armstrong of Maricopa County, Arizona, announces as the subject of discussion at farm bureau meetings through November "Does Your Farm Pay?"

H. J. Ramsay of the University of Arizona agricultural extension service is in the Salt River Valley discussing with lettuce growers plans for handling and shipping their crop.

Farm bureau meetings in Cochise and Santa Cruz Counties, Arizona, this month will discuss community work, winter crops, fall and winter plowing and live stock. Farm accounts and records will also be discussed and farm surveys made.

A. L. Paschal, farm adviser of Cochise and Santa Cruz Counties, Arizona, announces meetings for the remainder of November: Douglas, November 22, 23 and 24; Cochise and Pearce, November 26; Willcox, November 27; San Simon, November 29 and 30.

Many Arizona farmers are making plans to attend the fourth annual farmers' short course which will be held at the University of Arizona college of agriculture at Tucson the two weeks beginning January 3. Special rates on the railroads will be given to all attendants.

The Alpha Automatic Power Spray Outfit (Patented)

Fitted with 2 in. or 2½ in. Automatic Duplex or Triplex Pump
Equipped with the New Mechanical

Automatic Pressure Governor

The Automatic Pressure Governor Insures Safety, Secures Uniform Pressure and Eliminates Unnecessary Wear. No Relief or Diaphragm Valve Required. Top Guard Rails Fold Up or Can Be Quickly Removed. Gear or Belt Driven. Brass Fitted Throughout.

THE TWO ESSENTIALS in a power sprayer are a thoroughly dependable engine of ample horsepower and a positive and reliable pressure regulator that will insure uniform pressure and eliminate unnecessary wear.

THE AVERAGE SPRAY RIG is equipped with a cheap engine and a make-shift pressure relief valve or diaphragm which is exposed to the corrosive action of the spray material which soon puts it out of commission.

THE ALPHA AUTOMATIC PRESSURE GOVERNOR with which the Alpha Spray Outfit is equipped is a simple arrangement of two levers and a spring on each plunger connecting rod which, when the pressure reaches a predetermined limit, automatically discontinues the operation of the pump without interrupting the driving power, again permitting it to resume operation when the pressure falls below the point at which it has been set.

THIS INSURES SAFETY, secures uniform pressure, and eliminates unnecessary wear (no liquid pumped except it passes through the nozzles), the pressure relief is not dependent on the operation of a sluggish or defective relief valve, but is positive and mechanical, thus making it impossible to run the pressure up to the danger point.

THE POWER PLANT depending on the size rig is either a 2½ H. P. or a 3½ H. P. Alpha Engine equipped with a "built-in", gear-driven, positively timed magneto, requiring no batteries or coil, and is easily started on the magneto without cranking.

CAN YOU AFFORD to own a spray outfit that will balk? When you get ready to spray you have no time to tinker with a defective engine, pump or relief valve, but want an outfit that is capable of a continued high pressure maintenance and one that is thoroughly dependable in every particular.

THE ALPHA AUTOMATIC SPRAY OUTFIT will meet your most exacting demands. The entire frame work is made of channel and angle iron, fitted with a wrought steel bed plate on which the engine and pump are mounted, direct connected with machine-cut steel gears.

BUILT IN ALL SIZES from a 2-inch pump and a 100-gallon tank to a 2½ by 3-inch pump and a 200-gallon tank. (Either duplex or triplex.)

IT WILL PAY YOU to investigate thoroughly the merits of the Alpha Combination Power Sprayer before buying. Send for catalog and prices.

EMPIRE MILKERS

Cows Give Down Freely

DRAWS the milk just like a sucking calf—in spurts. Teat rests an instant between each spurt. Cows respond to this natural, gentle, yet firm action, and give down freely.

Capacity of double or two-cow unit is 20 to 30 cows per hour. Natural air pressure is used. Costs little to install—little to operate. Keeps more cows with less expense—less labor. The Empire turns the wages you pay hired milkers into increased profits for you.

Let us send you full description and pictures of Empire Milkers and Empire Cream Separators that are making good in many fine dairies. Ask also for our offer on the Empire Gasoline Engines and Empire Star Feed Mills. Ask for catalog No. 44.

EMPIRE CREAM SEPARATOR COMPANY, Bloomfield, N. J.
Chicago, Ill. Denver, Colo. Portland, Ore. Toronto and Winnipeg, Can.

Don't be deceived by appearances. The ground mica in

MICA AXLE GREASE

forms a silvery coating that makes the spindle appear dry and shiny. But this coating is slippery to the touch, for ground mica is a good lubricant in itself. It clings to the spindle and makes easier turning. That's why a little Mica Axle Grease goes a long way. Dealers everywhere.

SILOS AND SILAGE

Written for California Cultivator
By H. B. Worden

FOR the past two years we have been the recipient of thousands of letters and verbal inquiries from prospective silo users, asking for the elementary facts on silage and the use of silos. The following is a compilation of answers to the questions.

The silage system of today is no longer an experiment. It has been practiced for 30 years, but has come into much more general use within the last ten years. It may be said to be an evolution from a practice which appears to have been well established in Europe as early as 1842.

Trenches were dug in suitable soil about ten feet by ten feet, and as long as required. Corn or other forage crops were harvested while still green and packed whole, salt being distributed liberally during the filling and the mass well packed by tramping. The trenches were then covered with straw, heavily weighted with earth and left until winter. Upon removing the covering a proportion of the contents was always found spoiled, due to introduction of air despite all the precautions then possible to prevent it, but the bulk of the mass was usually well preserved and supplied succulent feed at a time when no other was available.

It is needless here to follow the evolution step by step through the various stages of pit silos, stone silos, square wooden silos, built inside barns, and other shapes, to the now universal cylindrical form fitted with continuous doors, except to note the vast amount of labor expended to reach a result now so easily and economically attained by modern cutters and their attached blowers and the cheap power everywhere available, which make possible the greater height of silos and their consequent greater storage capacity and better preserved silage.

Advantages of Silage

The advantages of the silage system may be briefly summarized as:

The sure preservation of succulent feed and making it available at all times, summer or winter:

The cheapest method of saving forage and the storage of the greatest quantity in the smallest space;

The reduction in the cost of production of milk, beef, mutton, etc., and the greater certainty of results;

The better assimilation of supplementary feeds—some succulent feed is necessary with all rations;

The saving of forage in unseasonable weather and its uniform quality;

Silage can be advantageously fed to all animals;

There is no waste and its use doubles the feeding capacity per acre.

Packing.

The few simple rules are: Harvest the crop at the right time; cut it fine, and pack solid in an airtight silo.

The crop should be hauled, run through the cutter and packed in the silo as soon as possible after it is reaped. Set the machine to cut one-half or three-quarters of an inch. The blower pipe should be set up vertically to prevent clogging. When not provided with a distributing pipe inside, one man with a fork should keep the silage evenly distributed and thrown toward the walls, where one or more men tramp it thoroughly for a foot or two next the walls. Close packing and an air-tight silo are essential to the making of sound silage. The mass must be so firmly packed that practically all the air is driven out of it. In effect, the exclusion of the air is the whole preservative; no salt is necessary, though if desired it may be added at the rate of about five pounds per ton of silage to add to its palatability.

It is not essential that the silo be filled in one day, but the filling should be continued from day to day until

completed. However, if it is desired to partly fill the silo and complete at a later date, any spoiled silage should be removed from the top layer before putting the new silage on top. In a day or two after the silo is filled there will be considerable settling of the contents, sometimes as much as six or eight feet, and to get the full capacity of the silo it is necessary to keep on filling until there is no further settling. Water may be run in on top to expedite settling, and this will also assist in packing the top layer and reduce spoilage. Water may also be added, preferably through the blower pipe to restore succulency. This can be done with any crop and is especially desirable when the crop is very dry when cut. A drain should be provided in the bottom to carry off any free water and this should be a tight pipe, fitted outside with a valve, plug or some means of shutting off the entrance of air, after the surplus water has drained off. This drain pipe should always be open when water is being run into the blowpipe or on the silage and as long thereafter as the liquid runs from the drain in a stream. This is to prevent a hydraulic pressure in the silo, which is bad for the silo and silage both. The excess water is not needed in the silo after it drains down through the silage. As soon as the water or juice runs slowly from the drain pipe or ceases running, shut the valve or plug the drain pipe tight so no air can enter the silo.

When the silo is filled, a fermentation is automatically started which persists for about two weeks and under normal conditions finally raises the temperature to 120 or 125 degrees.

At this point the bacteria which caused the fermentation are destroyed and the temperature slowly subsides. Meanwhile, a layer on top, four or six inches deep, will have moulded and this spoiled layer, like the mould on a jar of jelly, seals up the mass beneath, and it will remain sound as long as the top is undisturbed.

Feeding

When it is desired to feed the silage, first remove the spoiled top layer, being careful to get it all, and return it to the land via the manure pit; then feed a layer off the whole surface every day—one or two inches in winter, and three or four in summer. Any mouldy silage found later, due to imperfect construction, leaky doors, or improper packing, must also be put out of reach. Never feed mouldy silage to any animal. It is harmful to all and especially to horses and young stock.

A chute of some kind is of advantage in handling the silage from the silo to the wagon or other means of getting it to the manger or feed lot. The blower pipe may be utilized by the addition of a hopper at the top.

Be certain your silo is air-tight (except the cover) and that it is kept so. To insure this you must select a silo properly designed from a mechanical standpoint; if of wood made of thoroughly seasoned wood, machined with minute accuracy, and built by experts of experience in silo construction. The first cost of such a silo may be a little greater than that of the ordinary kinds, but in two years or any time thereafter it will be much cheaper and always surer and more satisfactory.

Materials for Ensiling

Corn is more generally used for silage than any other crop. Kaffir corn, milo maize and feterita are very close to it in feed value, being estimated at 90 per cent of corn, and in some sections may produce a greater tonnage per acre. Alfalfa, wheat, oats and barley all make good silage, and clovers and wild grasses may be siloed to advantage, notably in Alaska or other sections where weather conditions preclude their being made into hay. The first cutting of alfalfa is in

many cases the most profitable crop for the silo in California, on account of the fohxtail, burr clover and other growths which cheapen its value as hay, and of the weather conditions prevailing when it is ready to be cut. It can be siloed without regard to the weather, and the fohxtail, etc., are rendered harmless and make better feed than straight alfalfa. (See University of California Circular No. 24, January, 1915).

Cow peas and soy beans make good silage and, being high in protein, are sometimes siloed with corn to balance the high carbohydrates in the corn. They may be grown and harvested together, or if grown separately may be siloed together by running one load of peas or beans through the cutter to about three loads of corn.

Corn should be cut for silage when the grain is fully formed and glazed, but before it becomes hard—when the ear is in the soft roasting stage. If cut earlier the resulting silage will be more sour and not as high in feed value, and it is not so high in feed value when fully ripe; at this time the bottom leaves will have turned brown and the stalk partly dried, and water should be added to restore succulency. Kaffir corn and similar grains should be handled in much the same way.

The small grains, wheat, barley, etc., should be cut when the grain is in the dough. If left to ripen the stems become hard and carry air into the silo which it is difficult to get rid of.

Alfalfa should be cut when the first blooms appear or a little earlier. It is then at its best in food value; the next crop will not yet have stood out enough to be set back by cutting, and the fohxtail, etc., will not yet have seeded.

Cow peas and soy beans should be cut while the vines are still green—about the same as corn.

Food Value of Silage

It is difficult to state the actual monetary value of silage in comparison with dry hay. It is generally conceded and undisputed throughout the great silo using districts in the Eastern and Middle West states that

ter is the principal factor in the economy of filling the silo; keep it running to capacity without waste of teams or labor at any point. Silage is a feed for dairy cows, beef cattle, sheep and hogs. A cow in full milk consumes with advantage about 40 pounds per day in two feeds night and morning, preferably after milking. The amount will vary with the breed and even with the individual cow from 25 to 40 pounds, depending on the individual animal. The silage should be supplemented by what dry hay the animal will clean up and a portion of grain, and will keep her in full flow of milk as when on green pasture. A steer will eat from 20 to 30 pounds per day and sheep up to 5 pounds per head and, owing to its beneficial effect upon the digestive tract, the grain ration is better assimilated and the animal takes on fat more readily and makes more weight on a smaller amount of grain than when the roughage is exclusively dry. Feeding silage to sheep not only keeps them in good condition during the winter for spring lambing, but increases the weight of the animal and very markedly increases the length and quality of the wool. Wool growers are now convinced of the great value of silage for sheep.

Silage and hay alone form a good maintenance ration for dry cows, for bulls not in active service, for wintering horses, and for calves as soon as they will eat it. Silage is a good feed for brood sows, keeping them in good health and inducing a good flow of milk at farrowing time. It will also replace green pasture for growing pigs. Many hog raisers are now using silos for exclusive hog feeding.

THE HENDERSON STOCK FARM

Just over the southern border of Sacramento County in San Joaquin County lies the old farm of the Henderson family. Five hundred gently rolling, oak-besprinkled acres which have been in the family since "the days of old, the days of gold, the days of '49," for it was in 1850 that the farm first came into the possession of Mrs. Henderson, the mother of the family. Today an entire family is

THE HENDERSON BARN AND SILOS

75 per cent of the amount of dry hay necessary to feed a certain number of stock at a given time will do the same work when siloed. It is equally well known and undisputed that this silage will increase the beef capacity and the milk production about 15 per cent. These figures are comparative but are the result of years' of tests and actual practice. There is also a great variation in the capacity for assimilation of the different breeds and also even in different individuals of the same breed. Repeated experiments in different sections have established an average feed value of \$6.00 per ton for beef and about \$7.50 per ton for dairy cattle. These figures would vary in different localities and the nature of the crop—but are conservative. The cost of making silage, exclusive of growing the crop will run from 50 cents to \$1.00 per ton, depending upon the length of haul, the weight of the crop and other factors, but principally the skill with which the teams and labor are arranged. For the best results teams enough to keep the cutter working should be used and the crop should be reaped only as fast as it is hauled to the cutter. The cut-

ting is the principal factor in the economy of filling the silo; keep it running to capacity without waste of teams or labor at any point. Silage is a feed for dairy cows, beef cattle, sheep and hogs. A cow in full milk consumes with advantage about 40 pounds per day in two feeds night and morning, preferably after milking. The amount will vary with the breed and even with the individual cow from 25 to 40 pounds, depending on the individual animal. The silage should be supplemented by what dry hay the animal will clean up and a portion of grain, and will keep her in full flow of milk as when on green pasture. A steer will eat from 20 to 30 pounds per day and sheep up to 5 pounds per head and, owing to its beneficial effect upon the digestive tract, the grain ration is better assimilated and the animal takes on fat more readily and makes more weight on a smaller amount of grain than when the roughage is exclusively dry. Feeding silage to sheep not only keeps them in good condition during the winter for spring lambing, but increases the weight of the animal and very markedly increases the length and quality of the wool. Wool growers are now convinced of the great value of silage for sheep.

**STALLS and STANCHIONS**

The Clean-Cut Simplicity of Louden Stalls and Stanchions in design and construction; their absolute freedom from dirt-gathering cracks, crevices, corners or attachments, make them the only really sanitary barn equipment.

The Superior Flexibility of the Louden Stanchion permits the cow to lie down or rise without the dangerous straining common to the more rigid type. The Louden Stanchion (all steel or wood-lined) is an absolutely safe and comfortable stanchion.

Louden Stalls and Stanchions are built of the finest, high-carbon tubular steel and are exceptionally strong, easily installed and cost no more than wood.

We also manufacture Feed and Litter Carriers, Spring-balanced Mangers and Manger Partitions, Bird-proof Barn Door Hangers, Hay Tools, Power Hoists; Calf, Bull, Cow and Pig Pens, Window Ventilators, Etc.

to be transformed into a grassy park. A cement walk in front of their long line makes for cleanliness. Their location is ideal. The ground slopes gently from them both in front and in the rear, giving perfect drainage. Cement tanks in the rear hold all flushings from the milking stables and yards until taken therefrom and placed on the fields. Three 120-ton stave silos furnish food for the herd of Holsteins, 50 of which are of registered stock. These will soon be augmented by an equal number which Mr. Henderson will purchase from the best Eastern herds on a trip which he plans to make in November. He plans that 30 of these additions shall be royal daughters of the King of the Pontiacs. Three of the bulls to lead this herd are Son of King Segis Pontiac out of Elsie Velma Wayne, Son of King of the Pontiacs out of Inka Segis 3rd, a world's record cow, and Son of King of the Blacks and Whites out of Lillian Walker 2nd. In addition to the pure breeds the farm now has 117 grades which are later to be disposed of and replaced by purebreds. Two hundred acres are being put into alfalfa, watered by six driven wells, each throwing 1000 gallons a minute by electrically driven pumps, the water in great quantities being obtained at 200 feet below the surface. There are horse barns, implement warehouses, calf barns, animal hospital, modern cement floored, ventilated milking sheds, separator house, tank and pump for fire protection and general use. Feeding sheds to shelter the cattle in storm are a feature.

The manager and family have a house of their own, and a neat bungalow furnishes a home for the men. Here they have bath and shower and most comfortable quarters. This is of great importance and makes for success. This place is and will be a show place for the farmers and dairymen of the state, a help in demonstrating to them the benefits and greater profits to be derived from the use of modern methods and better stock.—C. A. Briggs.

FIELD NOTES

Written for California Cultivator
By C. A. Briggs

For years Mr. C. A. Briggs has been connected with the farm department of the Sacramento Bee. He has now transferred his activities to the California Cultivator and will be looking over the farms in the central part of the state securing information which will be of value to our readers.

At the McGillivray Ranch

In a bend in the Sacramento River a few miles out of the Capital city lies the splendidly developed dairy farm of Mr. and Mrs. James McGillivray. Three hundred and twenty fertile acres, well equipped with a thoroughly modern set of barns, milking sheds and yards provide for a herd of over 100 registered Holsteins; many of them of the very best blood and breeding in the state. In addition to these there are 256 valuable grades of the same breed. The most prominent structure on the place is the massive cement silo which holds 600 tons of corn or 800 tons of alfalfa. All milk and cream is sent to the wholesale market in Sacramento. The calves are fat, healthy looking youngsters, showing that even the skim milk on this farm is good, for they are fed liberally of it, the McGillivrays believing that the first year of a calf's life is a very important one. A score or more of splendid heifers, soon to be in milk, promise to add to the farm's glory and the high records of the older cows. One of them, Inka Tritomia 2nd 71407, won the grand championship award at the California state fair at Sacramento two years in succession, 1913 and 1914. The herd bulls are well cared for and in fine condition. All manure from barns and sheds is flushed with ample water supply into an immense vat, from which it is pumped into cement lined ditches and carried by gravity over every field on the farm.

The feed question is amply provided for by broad fields of alfalfa and fields of corn that would do credit to the Middle Western corn belt of Iowa and Illinois. While the main business is the breeding of registered Holsteins and the marketing of their product, there are several side issues of moment on the farm, notably the 94 acres of beans and other farm crops.

The Grape Wild Farm Guernsey herd and Berkshire swine are being transferred to Mr. Humphrey's Escalon ranch. A number of the herd are now at the exposition at San Francisco.

* * *

Harvesting of 94 acres of beans on the James McGillivray ranch, six miles out of Sacramento, is just finished. Owing to a wet spring and some other troubles the yield is not so large as that of last year. Twenty acres are of the pink variety the balance bayos.

* * *

A. B. Humphrey's Grape Wild Farm at Mayhew out of Sacramento on the Folsom road, is shipping about a car a day of fine Tokays to Eastern markets. Crop has been short but is of good quality. Weather allowing, shipment will continue for about three weeks. General fruit on this farm has shown an average crop. Almonds not as heavy a crop as in 1914.

HOGS FOR HOME BUTCHERING

The farmer is entitled to the best pork that can be produced. It is better not to wait until the animals are fat, but to select a few at once and feed them especially for home butchering. They should have some muscle-building material in addition to the corn, so as to get a proper mixture of lean and fat meat. Oil meal, shorts and tankage are very good to add to corn and wheat may well form part of the feed, especially this year when there is so much field-damaged grain on hand.

Select hogs that combine as many as possible of the good points of bacon and lard breeds so that there will be reasonably good sides as well as hams and shoulders when the carcasses are cut up. Keep the animals selected growing rapidly but do not let them get too fat, in order to get the most desirable hams and bacon cuts, even though this method does not bring as much lard.

Kill more hogs than you need for your own use so that you will have some country-cured meat to sell. Many people will buy it in preference to anything else, especially if you establish a reputation in this line.—P. F. Trowbridge, Missouri College of Agriculture.

PACIFIC INTERNATIONAL LIVE STOCK EXPOSITION

The Pacific International Live Stock Exposition, holding at the Union Stock Yards, North Portland, December 6-11, has been very aptly called the "Court of Last Resort", the place where the breeder and live stock enthusiast will find assembled the stock which has won championship honors at other shows during the fall and winter. The visitors to this show may rest assured that they are looking at the very best of the different breeds in the country. The winning of a grand championship at this show will be an honor highly coveted by breeders.

This is perhaps the only show in the United States given over strictly to the exhibition of live stock, there being no other activities or concessions, "Wild West" or vaudeville features to take the attention of the visitors. Another feature quite unlike all other shows is that of free admission, free stall rent, free entry for live stock, in fact the whole show is an educational exhibit, with the one idea in mind that the people are here for the purpose of seeing and hearing about cattle, hogs and sheep.

Early entries indicate a very strong showing in the fat stock division. It goes without saying that more hogs will be shown than ever before and with a better finish, while the sheep men are determined to make the sheep section thoroughly worth while.

Cash premiums of over \$15,000 will be given.—O. M. Plummer, Gen. Mgr., Union Stock Yards, North Portland, Oregon.

The Stanislaus Cow Testing Association tested 1497 cows during the month of October.

Poultry for Profit

EGG LAYING CONTEST

ON October 31 the National Egg Laying Contest, which has been conducted at the poultry experiment station of the Missouri agricultural college at Mountain Grove, closed. This is the fourth year of this contest. This contest was in two parts, the Missouri and the National, the Missouri contest being made up of pens from Missouri, other states and foreign countries. Each pen contained five hens and one substitute, which is used in case one hen should die or become incapacitated.

Missouri Contest

In the Missouri contest the ten highest pens for the year are as follows:

Pen 40, Barred Plymouth Rocks, 1050 eggs.

Pen 34, Barred Plymouth Rocks, 1049 eggs.

Pen 6, S. C. White Leghorns, 971 eggs.

Pen 0, S. C. White Leghorns, 957 eggs.

Pen 10, S. C. White Leghorns, 957 eggs.

Pen 38, White Plymouth Rocks, 944 eggs.

Pen 18, S. C. White Leghorns, 931 eggs.

Pen 2, S. C. White Leghorns, 897 eggs.

Pen 26, Buff Wyandottes, 891 eggs.

Pen 14, S. C. White Leghorns, 887 eggs.

Pen 23, Buff Wyandottes, 887 eggs.

National Contest

The ten highest pens for the 12 months in this contest are as follows:

Pen 21, S. C. White Leghorns, England, 939 eggs.

Pen 75, R. I. Whites, Illinois, 845 eggs.

Pen 19, S. C. White Leghorns, England, 844 eggs.

Pen 1, S. C. White Leghorns, Pennsylvania, 830 eggs.

Pen 74, S. C. Reds, Pennsylvania, 824 eggs.

Pen 76, Rhode Island Whites, New Jersey, 795 eggs.

Pen 3, S. C. White Leghorns, Pennsylvania, 789 eggs.

Pen 29, S. C. Black Leghorns, Georgia, 755 eggs.

Pen 8, S. C. White Leghorns, Kentucky, 754 eggs.

Pen 12, S. C. White Leghorns, Texas, 753 eggs.

Pen 70, White Plymouth Rocks, owned by W. B. Jenkins, Glendale, Kentucky, won the cup for October by laying 89 eggs.

The total number of eggs for the month of October was 2572.

The 200-egg hens in this contest are as follows:

Hen 2, Pen 1, S. C. White Leghorn, Pennsylvania, 230 eggs.

Hen 129, Pen 21, S. C. White Leghorn, England, 226 eggs.

Hen 73, Pen 13, S. C. White Leghorn, Pennsylvania, 208 eggs.

Hen 514, Pen 57, White Wyandotte, England, 208 eggs.

Hen 470, Pen 75, Rhode Island White, Illinois, 207 eggs.

Hen 131, Pen 21, S. C. White Leghorn, England, 204 eggs.

Hen 81, Pen 14, S. C. White Leghorn, Kentucky, 202 eggs.

Hen 277, Pen 43, White Orpington, Wisconsin, 200 eggs.

Estimating that eggs average 20 cents per dozen and that it costs \$1 to feed each hen a year, the hen which lays 60 eggs in a year just pays for her feed, and estimating that it costs

one-half as much for housing and labor, the hen which lays 90 eggs per year just pays her keeping. The hen which lays 100 eggs in one year makes a profit of ten eggs, while the hen which lays the sum of 120 eggs in one year makes a profit of 30 eggs, and is therefore three times as profitable as the hen which lays 100 eggs. The hens which lay 200 eggs per year make 110 eggs profit, which would be \$1.83 1-3 profit. Considering this as interest at 8 per cent on an investment, the hen would be worth \$22.91. This estimate is considered from a commercial viewpoint and not from a fancier's or breeder's viewpoint. The only breeder's consideration given is that the hen would reproduce herself so that the investment would be continuous.

Two hundred and forty-nine hens in the four contests laid 200 eggs or over in one year. This is approximately 10 per cent of the hens in the contests, while 253 or 14 per cent of the hens in the contests laid less than 90 eggs in one year. All hens in the four contests averaged 152 eggs each.

RELATION OF SHAPE TO PRODUCTION

Whether the shape of a hen's body influences egg production or egg production influences her shape, or both, we cannot say, yet we do see that good egg producers have triangular shaped bodies in the form of a wedge, the back being one side of the triangle, the breast another, and the third side being the distance from the pelvic bones to the back point of the breast or keel bone.

It matters little whether shape influences egg production or egg production influences shape, for the fact remains that the hens which are producing large numbers of eggs usually conform to this wedge shape, and we believe that something can be told of pullets even before they begin to lay.

Shape assists therefore in selecting the best producers, but where it is possible to trapnest for at least 30 days, much can be told of a hen's value as an egg producer by the rhythm of egg production. The number of eggs produced by a hen without missing a day is called a cycle. The number of eggs in each cycle tells whether the egg organs have the ability to produce eggs rapidly and the frequency with which these cycles are repeated tells whether the hen has a constitution which will stand up under the strain of heavy egg production. In other words, the number of eggs to the cycle tells the hen's breeding and repeating the cycles tells of the constitution.

If a hen lays four or more eggs to the cycle and repeats the cycles with only one or two days missed, she is a good hen. If a hen lays three or less eggs to the cycle and misses two or more days between cycles, she is of little or no value as an egg producer.

The hen which lays 20 or 30 eggs in one cycle, then misses ten or fifteen days, should be classed with the hen which lays regularly but lays only one or two eggs to the cycle. The first has well developed egg organs with a weak constitution while the second has a strong constitution and weak egg organs.

This method of selection is of value where the hens are trapnested for only two or three months during the breeding season or if a hen has been trapnested during the breeding season and should get killed, the rhythm of egg production would give an idea of the value of the offspring.

The Pasadena Poultry, Pigeon and Pet Stock Association and the Southern California Bantam Association unite in their sixth exhibition of poultry and pet stock on December 1-5 on North Raymond Avenue, Pasadena. Secretary M. D. Cartwright of 1713 Morton Avenue, Pasadena, is sending premium list and entry blanks.

Get Them NOW

Eggs! Eggs! Eggs!

GILBERT HESS, M. D., D. V. S.

Eggs are high now. Are your hens laying well to make up for the scarce egg crop during moulting? With no green stuff, no worms or insects and no exercise, hens must have a tonic during the winter or they won't lay. I have succeeded in compounding a tonic that will make your poultry healthy, help hens lay and keep the egg organs active.

DR. HESS

Poultry Pan-a-ce-a

A Tonic—Not a Stimulant

Formula printed on every package

I have had Pan-a-ce-a on the market now for 22 years; for nearly a quarter of a century it has stood the test and it has made good in every nook and corner of this country. My Pan-a-ce-a has in it blood builders, tonics, and internal antiseptics, carefully compounded, which, from my lifetime experience as a veterinary surgeon, doctor of medicine and successful poultry raiser, I know will do their work.

During all these years I have never asked a single poultry raiser or farmer to buy my Pan-a-ce-a on claims or say-so, but on a genuine money-back guarantee. Here it is:

So sure am I that Dr. Hess Poultry Pan-a-ce-a will help to keep your poultry healthy and help to make your hens lay, that I have authorized my dealer in your town to supply you with enough for your flock and if it doesn't do as I claim, return the empty package and get your money back.

1½ lbs. 25c; 3 lbs. 50c; 7 lbs. \$1.00; 25-lb. pail \$3.00. Pan-a-ce-a costs only 1c per day for 30 fowl.

My new poultry book tells all about Pan-a-ce-a. It's free.

DR. HESS & CLARK,

Ashland, Ohio.

Dr. Hess Stock Tonic

Your cows, horses and hogs are pretty apt to get out of fix during winter. Dr. Hess Stock Tonic contains tonics that improve the appetite and tone up the digestion, laxatives for regulating the bowels, and vermifuges that will positively expel worms. I guarantee it. 25-lb. pail \$2.25; 100-lb. sack \$7.00; smaller packages as low as 50c.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens with it, sprinkle it on the roosts, in the cracks, or if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 60c. I guarantee it.

Baby Chicks

We will book your order for White Leghorn or Black Minorca Chicks for 1916 delivery. We guarantee safe arrival of a full count of strong, vigorous chicks. Write for prices. When in Petaluma visit our hatchery.

Lasher's Hatchery

3-15 Kent St.

Petaluma, Cal.

Use Globe "A-1" Fish Meal--Why? Because it's the Best--Why?

Because of the following reasons: It is retort cooked, which does not allow any escape of nutrients. It is cooked at a low temperature which does not break down any of the food values. It is sanitary because conveyed directly to factory in steel buckets dumped in retort cooker and bucket sealed out with steam before returning for filling—also because when taken from cooker fish is absolutely dry. No pressing is required, thereby doing away with unsanitary press cloths. It has 10% less oil than any other Fish Meal, which is important, as the oil in fish, if running over 5%, will flavor both eggs and flesh of the fowl. Lastly, the protein in Globe "A-1" Fish Meal is 10% higher than in any other on the market.

All this is brought about by the process we use in preparing this meal. There is no other like it. Send for sample and prices.

Press, 237 Franklin St., Los Angeles.

LIVE STOCK

Big Type Poland Chinas—I have an extra
good lot of strictly high class young
boars from three months to one year old
that are fit to head any herd anywhere.
Visitors say they are the best they have
seen. They have the large size, the good
hams and shoulders, the strong arched
backs, great length and depth of body,
plenty of smoothness, mellowness and
quality—in fact, they have two good ends
and a good middle, are good lookers and
money makers. Their dams are either
from Illinois, Iowa or Missouri, or they
are from these states. These boars are
sired by Iowa Wonder, who will weigh over
1000 pounds in show condition. He is a
son of A WONDER, the greatest Poland
China boar living or dead. These young
boars carry the stamp of their sire and
will sire pigs that will please you. Satis-
faction guaranteed in every particular. I
am overstocked. I have boars galore. I
will sell them at extremely low bargain
prices. No females for sale at present.
The book on "THE HOG SUPREME—
THE POLAND CHINA" will be sent to
you free for the asking.

Yours for the BIG TYPE—the kind that
grow faster and larger and have more
pigs. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I.
C. Swine; the big white kind. Ready
for immediate shipment; weaned pigs of
both sexes; pairs and trios; mated not
akin. All these pigs are from big type
stock, of extra heavy bone; weight with
early maturing quality. Immunized
against hog cholera; crated and registered
free. Write for descriptive circular and
price list. C. B. Cunningham, Mills, Sacra-
mento County, California.

For Sale—Duroc Jersey Gilts; the dams
of these gilts were sired by such noted
boars as Nebraska Sensation, Cal. Chief,
Top Notch King. He by Modesto King
and bred to Bakersfield Jack and Fan-
Colonel. He by Defender Perfection. He
by Defender. Defender weighed 1100 lbs.
Sold for \$5000, and has more high priced
stock to his credit than any Duroc boar
in the U. S. John Kincaid, East Bakers-
field, Cal.

Del Dayo Farm (Old Haggin Bottom
Ranch). Registered Berkshires, both
sexes and from weanlings to one year
old. Now ready a few choice gilts safe
in pig and some very choice 10 mos. old
Boars and every sale absolutely guaran-
teed satisfaction. Stephen S. Day, Sacra-
mento, Cal.

Grape Wild Farm Thoroughbreds—Guern-
sey Bulls of A. R. Breeding, BERK-
SHIRE HOGS. Finest herd in the state.
All ages for sale. A. B. Humphrey, pro-
prietor, Mayhews, Sacramento Co., Cali-
fornia.

65 Head Registered Poland China Hogs
for sale; all sizes, both sexes. None bet-
ter anywhere. Large and medium type.
\$20.00 and up. We will please you or re-
fund your money. W. A. Young, Lodi,
Cal.

Blue Ribbon Herd Duroc-Jersey Hogs,
Service Boars and Bred Gilts a special-
ty; also boar and two sows, not related.
Meet me in S. F. 1915, prices. John P.
Daggs, Modesto, California.

Thoroughbred Poland China Boars of
large type for sale. Buy at home and
save express. Prices reasonable. For
further particulars write to Maywood Col-
ony Nursery, Corning, Cal.

Milch Goats—Young Nubian Swiss does,
bred from heavy milking stock. For
prices, etc., write Miss B. Stocker, 587
N. Broad St., San Luis Obispo, Cal.

For Sale—At all times, Jacks and Stal-
ions, driving and saddle horses. Price
and stock guaranteed. Phillips and
Kingsbury, 2318 G Street, Sacramento.

Poland Chinas—Lake-Side Stock Farm.
Weanlings to eight months. Satisfac-
tion or money refunded. Geo. V. Beck-
man, Lodi, Cal.

Berkshires—Pedigreed Boars ready for
service. Bred sows, weanling pigs, both
grade and thoroughbred, finest stock. C.
H. Thompson, Navato, Cal.

Calves Raised Without Milk—Cost less
than half as much as the milk raised
calves. Write for free book to Coulson
Co., Petaluma, Calif.

Registered Thoroughbred Berkshires of
all ages; Cholera immune; large boned.
Ricconi Bros., Mountain View, Cal.

Poland Chinas—Young Stock; either sex.
Write for pedigree. Reasonable prices.
Edwd. A. Hall, Watonsville, Cal.

anteed to fit or money back.
Put a set on that old gear. Write
today for list and measurement blank.
ARNOTT & COMPANY, Inc.
112-18 So. Los Angeles St., Los Angeles

FINE EXHIBIT

A series of interesting stories, with the
West as a setting, has been appear-
ing in the last few issues of Collier's
Weekly. Emily Post, under the title of
"By Motor to the Fair—a Trip from New
York to San Francisco", enumerates her
thrilling experiences and describes in a
most apt manner the wonderful, awe in-
spiring scenic effects of the West.

In speaking of the exposition exhibits,
it should be most gratifying to know that
among all the displays the exhibit of a
California concern should be considered
one of the two most interesting and at-
tractive on the grounds. This is indeed
a very high and praiseworthy compli-
ment, the original remarks themselves
bearing repetition:

"Everybody has read about the Ford
cars that run on a conveyor, beginning
at one end as pieces of metal and run-
ning off at the other under their own
power. That is undoubtedly the most in-
teresting exhibit to the public in general.
But to a woman the Sperry flour exhibit
is quite as ingenious and, if anything,
more interesting. They have a whole
row of little booth kitchens to show how
all the nations of the world use flour.

"A camper tosses flapjacks over a camp
fire, a colored mammy bakes Johnny cake
and corn pone, a Mexican makes enchil-
adas and tamales, a Swede, a Russian, a
Chinaman, a Hindoo, and four or five
others each make their national wafers
and cakes (and give samples!). In the
center at a big oven, is baked homemade
American bread and cake and pie of such
deliciousness that everyone who passes
by looks as longingly as the proverbial
ragamuffin at a baker's window".

HOW TO DESTROY MORNING GLORY

The writer has had considerable experi-
ence in killing morning glory with a liquid
called Nonpareil which is mostly com-
posed of carbon bisulphide. The growing
season of the weed is the time to destroy
it with Nonpareil. Successful treatment
has been made in many parts of the
state and amongst others, many acres at
Irvington, owned by Driscoll Brothers,
have been cleaned up, which contained
many patches of the weed, varying in
size from a few plants to places several
feet square, with an ordinary one-gallon
kerosene can or squirt can.

Each man is supplied with a short-
handled hoe and a can. He digs a hole three
or four inches deep around the root with
the hoe. The plant is then cut off with
a sufficient amount of the solution
poured upon the root to entirely cover the
exposed part, after which the dirt is
pushed back over it and packed down.
The advantage of this treatment is that
you can plant a crop in about twenty
days after the application. Treatment
should be made during the summer
months when the soil is dry and warm
and when the weeds are in their growing
stage. Remember there are a great many
roots on their way to the surface at the
time the first treatment is made and it
is therefore necessary to go back over the
land after a short period in order to com-
plete the eradication. Nonpareil can be
purchased from Wheeler, Reynolds &
Stauffer, San Francisco, or from whole-
sale druggists and dealers throughout the
state.

WINS THE GOLD

The Majestic Manufacturing Company
is justified in showing great satisfaction
in the gold medal won by Majestic ranges
at the Panama-Pacific International Ex-
position. Majestic ranges have won
friends all over America for many years
and it is a gratification to those who have
endeavored to produce a fine article to
have in addition to popular approval the
approval of careful judges who place
these gold medals.

By the way, this is not the first win-
ning which these ranges have secured for
similar honors were bestowed at St.
Louis, Portland, Seattle, Jamestown,
Knoxville and Omaha expositions. This
is a wonderful showing.

It is stated that the Egyptian Coun-
cil of Ministers has decided to remove
the prohibition by which cultivators
are not allowed to devote more than
one-third of their property to cotton
cultivation.

Questions

THE EDITOR

and Answers

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Hard Milker

Can you give us any information as to what to do for a cow that holds up her milk? While the calf was with her she gave plenty. Calf is now two months old and cow gives only about half as much milk. Know the milk is there because bag cakes every few days.—Subscriber, Glendora.

Cows have been milked by hand for so many generations that it has come to be looked on as the perfectly natural thing for them to give their milk readily to some milker rather than to the calves—while the perfectly natural thing for the animal to do is to guard the life giving fluid for the calf and refuse to be done out of it artificially. Occasionally a cow has this instinct to a degree that causes the milker much worry, and it is exaggerated when the calf is allowed to suck the cow for a considerable time as in this case. It is best to feed the calf from such a cow by hand from the start. Now the best thing to do is to be very patient and massage and manipulate the udder until the cow finally does give down her milk. When it is caked it is well to use some salve or mutton tallow and knead it in thoroughly.—W. S. G.

Best Walnuts

I have some land north of Chino, San Bernardino County, which I think well adapted to walnuts. Would like to know which is the best variety. When should they be set? In selecting trees should I take six or eight to ten foot trees? Would it be advisable to fertilize at time of planting? The trees are to be set in lands which have been growing alfalfa for several years.—Subscriber, Chino.

Walnut trees can be planted at any time after they have become dormant in the nursery rows but should be planted before the roots begin to form new growth in the spring, which is usually about March 1. If the trees are planted early in the winter and copious rains come it may not be necessary to irrigate until April, but it is always safest to follow the planting with at least enough water to thoroughly settle the soil around the roots. Sturdy trees of six to eight feet growth and with a good root system are better than taller trees with scanty roots. Do not put any kind of fertilizer in the holes nor near the roots when planting. A light covering of stable manure on top of the soil will be beneficial, but do not use commercial fertilizers the first year. There is nothing better for young trees than soil in which alfalfa has grown for several years.—J. B. N.

Feeding Parrot

Would some of your subscribers kindly tell me the proper food to give a parrot? Is hempseed its natural food?—Subscriber, Pacific Beach.

The lady to whom I submitted this question has kept a parrot seven years, and a very healthy, spirited bird it is. This lady says she buys nothing for her bird but sunflower seed with which she fills the cup in the cage once a day. For the rest the parrot eats what the family do, a cup of coffee in the morning, with milk and sugar, pancakes, bread, potato, crackers, etc. Green food is given in limited quantities, because there is

some danger of loosening the bowels if too much is given, and parsley is never fed. Canary seed is used by some people, but is not necessary.—J. A. K.

Shipping Cows

After the quarantine is raised would it be practical to ship 100 grade cows from an Eastern state to the Pacific Coast, about 75 milking and 25 springers? Could I arrange to give them proper care on road?—Subscriber, San Jose.

Shipping cows in milk and about to calve, to the Pacific Coast from the states of the Middle West is perfectly feasible. Hundreds have traveled the road and are now satisfactory producers in California herds. They can be given proper care if they are shipped when the weather in the East and through the mountains is not too severe; summer months are best. If they are shipped in ordinary stock cars or box cars they will have to be unloaded, fed and watered every 28 to 36 hours in accordance with the interstate commission rulings, but dairy cows need to be fed, watered and milked in the cars in addition to this. This must be kept in mind in loading the cars.

Dairy cows cannot be moved—even from one farm to another without having some effect on their flow of milk, and ordinarily when cows are shipped half way across the continent they do not come back to their normal flow of milk until after they calve again. There is possibility of accident to "springers" in moving them any distance, but the percentage of loss has not been great.

It is suggested that good dairy cows bring high prices in the dairy districts of the Middle West, and it might be well to make careful inquiry in the dairy districts in California as to securing suitable stock before deciding to bring them from the East.

The writer brought out two carloads of Holsteins from Wisconsin several years ago. They were fed, watered, milked, groomed and otherwise cared for as well as they would have been in a barn. After they had been on the train 12 hours they paid little or no attention to the motion of the train and to stops. At every division point it was necessary to have a long argument with some railroad official to keep from unloading for feed and water, as was required by law, but it was possible in every case to show them that the cattle were better off in the cars. The trip required 11 days, and the cattle were in splendid condition when they arrived.—W. S. G.

Breeding Turkeys

At what age does a turkey tom become too old for breeding purposes?—Subscriber, Moorpark.

A good, vigorous tom may be bred for five years, beginning when he is ten or 12 months old, but should not be used in the same flock more than two years unless he is mated to hens that are entirely unrelated. That is to say he should not be mated to his daughters more than once and many breeders consider once too often.—J. A. K.

Grafting Walnuts on Almonds

Is it possible to graft walnuts on almonds?—Subscriber, Campbell.

There have been so many freak or impossible things done in horticulture that we will not say as to the possibility of such a practice, but the almond is of the peach family, while

the walnut belongs to an entirely different family of trees. The cultivated California, or sometimes called English, walnuts find a most satisfactory host in the ordinary California black.

Dodder

Some time ago inquiry was made of this department as to poisonous growths of dodder. This was later referred to Prof. J. W. Gilmore of the University of California and he answers:

"We have had no evidence or even strong indication that dodder is ever responsible for the death of live stock pastured on land where this weed is prevalent. I have asked several other members of the faculty if they knew of any evidence which would substantiate the report that you mention, and while they are not willing to say that dodder might not be responsible for deaths, no evidence is at hand upon the subject. It is our belief that where live stock are killed upon pastures infested by dodder that the trouble arises from the eating of some other plant. Also, we have no evidence that dodder in hay is injurious. I have seen considerable quantities of alfalfa hay containing dodder fed without apparent injury. This is not saying, however, that an exclusive diet of dodder might not be injurious."

Diabrotica

A Mountain View subscriber asks as to insects destroying leaves of prune trees earlier in the season. This was referred to Prof. Quayle and he answers:

"The insects which were sent in by a subscriber from Mountain View prove to be the Western striped cucumber beetle, *Diabrotica trivittata*. If these insects are abundant enough on the small trees to warrant the expense they may be successfully controlled by an application of arsenate of lead."

WELL CASING

of superior merit—single and double—hard red steel, or galvanized—in all sizes. Ask for Catalogue 17.

We also manufacture the famous "American" Surface Irrigation Pipe, and Riveted Steel Pipe for underground use. Also all fittings for water systems, tanks, troughs, etc. Write for catalogues.

The Household Department

THANK GOD FOR THE COMMON-PLACE THINGS

The commonplace things of an everyday life,

They crowd us from morn till eve;
For tire as we will and fret as we may,

'Tis by commonplace things that we live.

The grass and the flowers, the birds and the trees,

The river that winds on its way,
The books on the shelf, the prints on the wall,

These furnish our commonplace day.

The tasks that await us on every hand,

That forever insistent call;

The rooms to be tidied, the meals to be cooked—

These are commonplace duties all.
And we turn with a sigh from the dreams that entice,

Of study and travel and leisure—
The wonderful things that make up a life

Where duties conflict not with pleasure.

And yet, were the power of choice our own,

Would we give up the commonplace things,

Or cut a strand of the cord that binds
The duties that every day brings?

Thank God for the anchor that holds us fast,

For the song that contentment sings,

For the lasting power of an everyday life,

Thank God for the commonplace things!—Annette M. Stubbs.

"COME OUT, ALL"

In the parlor all except mother, who is bustling at the fount of those Araby odors, are gathered in a studiously indifferent circle. Of course to such the eating part is nothing. They can wait, enjoying conversation. The reminiscences of the evening before around the lamp and hearth are resumed, fascinating then, but now—huh!

"Do you remember, Lou?" asks father. Uncle Lou does. Ha, ha! Ho, ho! Nevertheless—

Will dinner never be ready?

Aunt and uncle and grandparent draw you to them to fondle and banter and query. But how may one know how old one is, or where was Moses when the light went out, or why a hen crosses the road, when one has resolved into stomach and nose and all one's thoughts are in that adjoining room?

Will dinner never be ready?

Grandmother is telling you in her gentle voice of when she was a little girl and not so old as you and they had Thanksgiving. Interesting should such a recital be. But—

"Oh, dear! Won't dinner ever be ready?"

"Where are you going, Johnny?" demands father sternly.

You want a drink of water—just a drink of water—in the other room.

"No; you stay right in here with us. You'll bother mother."

W-well. But—

Won't dinner ever— Ah! Mother stands upon the threshold. Flushed, warm and triumphant, she bids, "Come out, all."

Since then you have heard by the Dutch ovens of the roundup fire the cook's long yelp of "Chuck!" or on shipboard you have sprung to the galley boy's beckoning wake. You have dropped most willingly into place at the logging camp long table or, tired and spent by a day of strenuous business, in the club's cafe you have sighed with relief as the silent waiter bore in the soup and bread sticks. But mother's smiling "Come out, all," can never be overshadowed.—Edwin L. Sabin in Lippincott's.

ART AND A THANKSGIVING

On November 23 things looked pretty gloomy for Sebastian Caswatter. He had intended to celebrate Thanksgiving day as it should be celebrated, with all the proper accompaniments. But the trouble was that Caswatter did not know just exactly where the money was to come from. With rare providence he had set apart a \$5 bill from the sale of his "Prometheus," but the coal had run out, and more had to be bought.

"Never mind," said Caswatter; "I'll take that 'Autumn Sunset' down to Perdigan tomorrow. I'd made up my mind that I'd keep it if I couldn't get a hundred for it, but if Perdigan wants it for \$50 he can have it."

Mrs. Caswatter almost wept, for she knew how much her artist husband thought of that "Autumn Sunset." He would almost rather have parted with his "Solitude," or his "Gloaming," or his "Achilles In His Tent." It was a masterpiece. "Solitude," "Gloaming," "Achilles" were also masterpieces. There were few things that Caswatter painted that were not masterpieces. The great difficulty with them was that they would not sell.

"But, then," Caswatter would say, "I don't paint to sell. It is my misfortune that I believe in art. I follow my ideals as Michelangelo, Guido and Burne-Jones followed theirs. I suffer from neglect now, but the time will come when I shall be recognized."

On the 24th Caswatter took the "Autumn Sunset" under his arm and offered it to Perdigan. But Perdigan declined to give him the \$50 for it—in fact, he wouldn't have it at any price. Caswatter bore his disappointment with an air of indifference, but he felt it nevertheless, and it was with a rueful face that he met Mrs. Caswatter on his return.

He went upstairs to his attic studio and began to pace the floor in great agitation. He was an artist, but he was also a father, and the thought of little Leonard's disappointment when invited to sit down to pork chops was maddening, and the pork chops seemed inevitable. As he walked and gnawed his beard his eye fell upon "Solitude" and he made a sudden resolve. He would have that Thanksgiving dinner at all costs. He wrapped the picture carefully in the paper that he had just taken off the "Autumn Sunset" and started out.

Perdigan looked at it with his under lip pushed out and said:

"Well, I'd like to make you an offer for it, but—you see, it isn't the sort of thing that sells. I'll tell you, though, if you would like to leave it here I'll do the best I can with it on a commission."

"I suppose you wouldn't care to advance me a little on it?" said Caswatter.

"Why, I'd like to, but you know that's altogether against our rules."

"I'll leave it," said Caswatter.

Caswatter went back to his studio and did some more walking. Usually he dismissed household cares easily from his mind, but this dinner he had counted on so surely. He could see it—actually see it. He laughed savagely and, sitting down before his easel, began to sketch the outlines of a mammoth turkey. Then the idea took him, and he forgot his woes. Gradually the turkey took shape and form, and a celery glass topped with a fringing bouquet of stalks and leaves appeared beside it, then a bowl and a background of pies. He drew up his stool closer and began to spread on color and worked more and more feverishly until the waning light forced him to desist.

Early on the morning of the 25th he arose and attacked his "Barmecide Feast" with undiminished fury. By 11 o'clock it was finished. He took it down into the little dining room, set it up on the mantelpiece and then called Mrs. Caswatter to look at it.

"There's your Thanksgiving dinner," he said. "We'll look at that and imagine it's real."

Mrs. Caswatter was visibly impressed. "What a genius you are!" she said admiringly "That turkey looks as if it had just been taken from the oven. I can smell it, and the cranberry sauce!"

At 12 o'clock Mrs. Caswatter tapped at her husband's door. "My dear," she said, "I hate to disturb you, but Mr. Tublin, the grocer, is down below. He says he's called for the balance of his account. I told him you were busy, but he said he'd like to see you and he'd wait."

Caswatter groaned. "Well, I'll be right down, dear," he said.

When he went downstairs he found Tublin in the dining room standing before the turkey picture, open-mouthed with admiration.

"A fine picture that, sir," he said with feeling.

"About that balance—how much is it?" asked the artist.

"It's only \$5.35," replied the grocer. "I was just passing, and—I never saw a prettier piece of work than that. It'd make a dandy thing for my window."

"You look in next week some time and I'll pay you," said Caswatter.

"Much obliged," said the grocer absently. "Now, that picture—I wonder where I could buy one like it."

"You can have that for a \$10 bill," said Caswatter.

The grocer instantly produced a fat pocketbook and, taking out a bill, laid it on the table and advanced to the picture.

"Here's it's wet yet," said Caswatter.

"So it is," said the grocer. "Well, I must handle it carefully. That's going to help trade this afternoon and this evening. Good day, Mr. Caswatter."

Caswatter looked at the \$10 bill on the table, then he smote his forehead.

"Oh, art!" he cried in anguish.

But an exact replica of the pictured turkey smoked on his table the next day. And if when his last piece of pumpkin pie was consumed Caswatter was not thankful he certainly looked it.—Riverside Press.

THANKSGIVING MENU

Cranberry Sherbet in Red Apple Cases

Chicken Pie en Casserole

Sweet Potato Croquettes

Stuffed Onions

Creamed Young Turnips

Cucumber Jelly Salad

Hot Buttered Rolls

Sweet Potato Pie Coffee

Fruits Nuts

Onions Stuffed with Ham

Peel eight good sized onions, cover with boiling water and let cook until nearly tender, drain, rinse in cold water and drain again. Cut out the center of each onion to leave a thin-walled case. Sprinkle the inside of each with a little salt. Mix together one cup of chopped ham (cooked), one cup of fine, soft bread crumbs, one-fourth a cup of melted butter, half a teaspoon of paprika, one-fourth teaspoon of salt, one tablespoon finely chopped parsley and the onion that was removed, chopped not too fine. Fill centers with this mixture, rounding it up well. Pour a cup of thin cream or rich milk around the onions and let cook in the oven about 25 minutes, basting two or three times with the liquid in the dish. Mix three tablespoons melted butter with three-fourths cup of cracker crumbs and spread over the top of onions. Return the dish to the oven to brown the crumbs. Serve from the baking dish.

Chicken Pie en Casserole

Separate a young chicken into pieces at the joints, wash, wipe, roll in flour and let cook in salt pork fat, first on one side and then on the other, until a golden brown. Place in casserole, add boiling water, and salt and pepper as needed. Cover and let cook until tender. Have ready, for each service two slices of carrot and four or five potato balls cut out with a French cutter. Parboil the vegetables about ten minutes, drain, rinse in cold water, dry on a cloth and let cook in the frying pan where the chicken was cooked until well colored, then add to the casserole. Pour a lit-

tle boiling water into the frying pan and let simmer until the browned juices of the chicken and vegetables are dissolved, then pour this into the casserole. Prepare a rich biscuit crust or round of flaky pastry the size of the top of casserole, to rest on the edge of it. Place in oven and bake about twenty minutes.

Cucumber Jelly Salad

Pare two cucumbers and cut in slices, add a slice of onion, a stalk of celery, half a tablespoon of nasturtium seeds, a slice of green pepper and a scant half teaspoon of sweet herbs, with water to cover. Let simmer until the cucumber is tender, then press through a very fine sieve. Season with salt and pepper. For each pint of liquid take one generous tablespoon of granulated gelatin softened in one-third cup of cold water and dissolved over hot water. Tint delicately with green color paste and turn into individual molds to harden. Turn out each service on a crisp lettuce leaf, garnish with mayonnaise and a sprinkling of paprika.

Sweet Potato Pie

Press sufficient hot, cooked sweet potato through a sieve to make a cup and a half, add, in the order given, three tablespoons butter, one cup and a fourth of sugar, half a teaspoon each of salt, cinnamon and mace, the beaten yolks of three eggs, the whites of three eggs beaten very light, two cups of rich milk and one-fourth cup of double cream. Mix all thoroughly and bake in a large, deep plate lined with pastry until firm in the center. The proportions given are just right for a pie plate of the usual size.

DATE RECIPES

Date Pies

One cup sugar, half cup butter, quarter cup milk, yolks of three eggs, one cup of dates (seeded, ground and cooked), three quarters of cup of English walnuts, one teaspoon vanilla. Make rich pie crust, line gem pans, put two tablespoons of filling in each crust. Bake until crust is light brown. Cover top with meringue of whites of three eggs well beaten and cup of sugar and vanilla.—Mrs. C. N. Ellis, Indio.

Date Pudding

One cup chopped dates, one cup English walnut meats, one cup sugar, two eggs, four tablespoons cracker crumbs, three tablespoons milk, one teaspoon baking powder. Mix all thoroughly. Steam one and one-half hours. Serve with whipped cream or ice cream.

Date Salad

Steam dates over boiling water a very few minutes. Remove seeds and place in each a walnut kernel. Put on ice and chill thoroughly before serving. When ready to serve place dates on very crisp lettuce leaves and pour good salad dressing over all. This combination is delicious.—Mrs. C. B. Lewis, Thermal.

Date Pies or Tarts

One cup of sugar, half cup of butter, third cup of milk, one cup of seeded dates, three-quarters of cup of English walnuts, ground, yolks of three eggs, one teaspoon of vanilla. Grind the dates and cook in a little water until tender and almost dry. Mix sugar and butter well together, add yolks of eggs, milk, dates, walnuts and flavoring. Line gem pans with rich pie crust, place a tablespoon of filling in each gem pan and bake. Cover each pie with meringue, place in oven and brown.

Meringue—Three egg whites well beaten, one cup of pulverized sugar, flavoring to taste.

Date and Nut Loaf

One pound dates (after stoning), one pound walnut meats, one cup flour, one cup sugar, half teaspoon salt, two rounding teaspoons baking powder, four eggs (yolks and whites beaten separately), one teaspoon vanilla.

Mix salt and baking powder with the flour, add to dates and walnuts, add sugar and mix thoroughly again, add egg yolks then fold in the whites and add the vanilla. Pack into a loaf tin lined with buttered paper and bake in a slow oven one hour. This cake

Citrus Fruit Market

LOS ANGELES, Nov. 17, 1915.

By the time this copy of the Cultivator is in the hands of the readers the last Valencias for 1915 will be on the way to the market and probably all will be in the hands of retailers. Although properly belonging to last year's crop these few cars of Valencias—perhaps less than 300—will be credited on the new year, which began November 1, 1915, complete reports of shipments for which were given in last issue.

As to the Navels they are much later than it was anticipated they would be. While there have been a few straggling shipments from Northern and Central California general shipping will not begin before the 29th or 30th of the month. The quality will be high and the growers are insisting on holding fruit till they will stand the eight to one test.

Lemons are going forward nicely and commanding fair prices—better than last year at this time. All freshly cut fruit is sweated and shipped at once. The Austrians have aided—lemon aid as it were—the market by sinking one ship with 11,000 boxes of Italian lemons aboard. Besides that other ships afloat are coming to market with 21,000 boxes. The number afloat last year same date was 54,000 boxes and the preceding year 72,000 boxes. Hence a most hopeful feeling obtains. About 15 cars daily are going forward.

Shipments

Shipments of oranges from Southern California to date since November 1, 1915: Oranges 359 cars, lemons 163, total 522. To same date last season: oranges, 231, lemons 148, total 379. From Central California: oranges 14 cars, lemons 23, total 37. To same date last season: oranges 57, lemons 22, total 79. From Northern California this year, neither oranges nor lemons; last year same date 15 cars oranges.

NEW YORK, Nov. 15.—Sixteen cars Valencias, three cars lemons sold. The market is unchanged on both oranges and lemons. Cloudy.

DATE RECIPES

Continued from Page 501

wrapped in paraffin paper will keep indefinitely and improve with age.

Date Tapioca

One-half cup tapioca, one cup sugar, three oranges, one lemon, one pound dates.

Stir tapioca into three cups of boiling water and cook in a double boiler until clear. Mince dates, add sugar and mix with the pulp of the oranges and the juice and grated rind of the lemon. Put layer of tapioca in well buttered baking dish, then the fruit mixture. Cover with the remainder of tapioca and bake half an hour. Cover with meringue and brown delicately. Serve perfectly cold with cream.

Mocha and Date Cake

One cup of sugar, half cup of strong coffee, half cup of dates, chopped fine, half cup of walnuts, chopped fine, two eggs, one and three-quarter cups of flour, one-third cup of softened butter, one and one-quarter teaspoons baking powder, one teaspoon vanilla.

Beat sugar and egg yolks together eight minutes, add butter then other ingredients, beaten whites last.

Filling—One-third cup butter, one and one-third cups powdered sugar, one teaspoon grated chocolate and vanilla to taste. Add strong hot coffee, drop by drop until right consistency to spread on cake. Beat hard.—Mrs. Bruce Drummond, Indio.

LOS ANGELES

November 25, 1915

SAN FRANCISCO

When the California Walnut Growers' Association began shipping nuts it determined to send out only the highest grade product. Rigid culling threw out many of highest quality but of satisfactory appearance. This product is now being saved at the Los Angeles cracking plant of the association, where two grades of kernels or meats are being packed in attractive cartons with waxed paper wraps. These are commanding ready sale at satisfactory prices. The cracking machine is shown in the background of this picture; the long table is one of several.

Removing and Sorting Walnut Kernels

Mathews Reversible Twin Disc Plow

THIS is the only reversible disc plow which does not use segments to fix the position of the disc, and is therefore the only one which will always plow the same width of furrow both ways on level land and hillsides—and stick to the work on hillsides.

It leaves no water furrows. Discs are fixed in exactly the same working position every time the plow is lowered. Two discs wear twice as long as one—but cost you no more.

We are general agents for a complete line of Disc plows. Glad to tell you about them at any time.

**LUBRICATED
ROLLER-PINIONS**

are used on all

SIEVE-GRIP

Reg. U.S. Pat. Off.

TRACTORS

The rollers in the roller-pinions revolve on internally lubricated pins—no dust can get in to wear them.

They only press on the teeth of the big drive-gear—the real bearing surface is between the rollers and the pins. Friction is cut to the least possible amount and lubrication made unnecessary between rollers and gear-teeth.

This in turn lengthens the life of both rollers and gear.

Rollers and gear-teeth fit snugly together—no looseness and loss of power.

This is but one of the many exclusive features of

SAMSON TRACTORS

Sieve-Grip tractors are made in two sizes, a four to five horse-pull on the drawbar with ten horse-power for stationary work and an eight to ten horse-pull with twenty horse-power.

Let us tell you how a Sieve-Grip—the tractor that works—will cut power costs on your farm. Write us today and we'll put you on the "line" for our monthly magazine "Samson Sieve-Grip Sitings." Ask for Booklet CC-1

One Dollar Yearly

47th State Fruit Growers Convention

Marketing Methods, Rural Credits, Cooperation and Other Points Discussed, with Excellent Tractor and Farm Implement Exhibit on the Side. Tulare County People Give Cordial Greetings and Extend Courtesies to Delegates from All Parts of the State

MOST interesting week began at Visalia last Tuesday morning, November 16, when the State Association of County Horticultural Commissioners was called together by President William Wood. Secretary O. E. Bremner, and practically every member of the association, was present. Perhaps the principal point of interest had to do with the collection of accounts against delinquents who have had orchard property treated by county outfits and have failed to pay. This matter called for a special resolution as follows:

"Whereas, In a recent case in the superior court of Tulare County, brought to test the validity of a lien for fumigation of citrus trees, the court ruled that a prior mortgage held precedence, and

"Whereas, This ruling is contrary to accepted practice for 18 years and seriously affects the citrus industry by exempting encumbered property from fumigation without the consent of owner, which is often necessary, and

"Whereas, This case has been appealed to the supreme court of California; therefore, be it

"Resolved, That we, the members of the 47th convention of County Horticultural Commissioners in regular session assembled at Visalia, do hereby petition Frank M. Angellotti, chief justice of the supreme court of California, to advance this case if possible on the court calendar in order that a definite decision may be reached before the opening of the next fumigation season in July, 1916."

Officers elected for the coming year are: Charles F. Collins, Tulare County, president; D. D. Sharp, Riverside County, vice president; H. G. Kercheval, Sacramento County, secretary-treasurer.

The commissioners' meeting continued through Tuesday and Wednesday. Thursday morning President A. J. Cook of the state horticultural commission called the convention to order. After music and invocation a hearty welcome was extended to the convention attendants, to which Dr. Cook replied at some length, reviewing especially the accomplishments of the state commission. Amongst other things he referred to Prof. Fawcett's work when connected with the commission in the discovery of a remedy for gummosis of citrus trees; to the Weldon crop reports; to the victories gained in the California legislature, especially the securing of favorable congressional action controlling the unlimited shipment of quarantined material through the mails; to the fact that ten county horticultural commissioners have been added during the present administration; to the standardization laws of our own state legislature; and ended by saying:

"Several achievements yet await fulfillment. Each fruit county must have a county horticultural commissioner or inspector; the potato industry must be restored to its former prosperity; a few changes are needed in the parcel post regulation; improvements in marketing conditions, and possibly slight modifications in the standardization laws, and then we

may rejoice that the great practical horticultural system of California is well-nigh perfect."

Many addresses at the various sessions are far too extended to even be reviewed at this time. Two of them appear in this week's issue entire and more will follow in later issues of the Cultivator.

The cordial reception of all delegates attending by the committee and residents of Tulare County made the occasion a most enjoyable one. The

RURAL CREDITS AND COOPERATION

Address By Sheridan W. Baker Before State Fruit Growers' Convention at Visalia

COOPERATION among farmers is a proper and an inevitable evolution, though it has taken many revolutionary steps to bring the many attempts to an approximate success. In many notable instances coopera-

problems peculiar to its especial organization, it seems that the time is opportune for taking further steps for the proper correlation of all cooperative organizations in the state.

The men who handle on a commercial basis millions of dollars' worth of farm products and put them out in a finished condition have their associations for their mutual protection and benefit. The farmers' organizations should take the same measures for their further betterment.

There are delegates regularly elected or appointed by their several organizations present at this convention for the discussion of this side of cooperative effort and that phase of rural credits that will make the proper financing of these organizations a less difficult matter.

If it is possible to form a central organization of an advisory and protective nature for all growers' cooperative bodies, the benefits to be derived can readily be understood.

A league or association formed by delegates from the various organizations of the state will represent many thousands of growers, and by holding annual or semiannual meetings, very much good should result in a better understanding of each other, to begin with, and properly officered it can become a most potent force in the bettering of conditions for the California farmer.

If it is possible to have some such body in existence to which matters of large import can be submitted for consideration and advice, there is no doubt that great good can be done. This body, with a small executive committee composed of men who have been prominent in cooperative success, can materially aid newer organizations in analyzing their situations and advising the ways and means that experience has taught to be the safest. In other words we need some sort of a cooperative organization commission to look into the affairs of struggling bodies, to help them organize, to be adjusters, judges and council. We need an assembly of cooperators of every variety pertaining to the farm; we need more united action and cohesion for quicker results, and there can be no question as to the desirability that all farm produce should be handled cooperatively, except, perhaps, by those whose business it is to make a more finished product.

If it is possible for the farmer by cooperating to place his product on a market regulated by supply and demand and to be consistently in the market over a period of time, he will receive average prices and be safe. The law of averages will be working each season for the even return on his labor and investment.

The sooner we get the majority of California farmers into cooperative marketing organizations, the quicker the desirable results. If there is any body of men interested in seeing that the farmer gets a living price for his products it is the men who are cooperating. The chances of getting a seasonal average as to price are open only to the large operator or one so situated that he can sell an annual crop on installments. This is entirely practicable and feasible with a cooperative organization. It surely is far more desirable and better for the individual farmer to get the average

Continued on Page 513

COMMUNITY COOPERATION

R. V. Holland

HERE are comparatively few small town residents who fully appreciate what their home communities mean to them, not only from a standpoint of sentimental loyalty or civic pride, but in the way of dollars and cents as well.

Investigation has developed the fact that it is only in very rare instances that the individual has prospered in a community that is "financially sick", for the simple reason that individuals are directly responsible for the general local conditions.

How many times have you heard people living in our smaller towns, especially those towns that are adjacent to larger cities, express the opinion: "This town can never be much bigger, it is too close to City."

In other words people living in the small towns and their trade territories spend a large per cent of their money, which is produced locally, in the stores of the big cities nearby. One would be nearer correct in stating that these people live on rather than in their home communities, and it doesn't take a very able prophet to foresee inevitable results.

Failure to patronize local merchants is largely unwarranted, and as more people come to realize the effects they will face about and cooperate closely along lines that will tend to improve and develop the communities in which they live.

I once witnessed a manufacturer's salesman endeavoring to sell a small town merchant an extraordinarily high grade line of goods. The merchant admired his sample very much, but finally refused to buy on the ground that local buyers of this class of merchandise shopped in the stores of the large city close at hand and would continue to do so even though they bought the same brand of goods at identically the same price he would ask for them.

This merchant undoubtedly knew what he was talking about although it seems a shame that such conditions should exist. It only goes to prove that when small town people get into the habit of buying quality products out of town, local merchants become afraid to carry them in stock, and it isn't long before local markets are restricted to the lower grades of inferior goods.

It is, of course, unnecessary to say that no fair minded person would expect even the most loyal buyer to pay a premium for the privilege of patronizing home merchants in preference to sending or going away. However, modern merchandising and manufacturing methods enable the smallest town store to offer the same inducements in the way of quality, style, and price that can be found elsewhere, with the added advantage of personal service. A standard article represents the same value the world over.

When progressive merchants in the smaller towns become convinced that their trade will patronize them on standard products of known quality—provided their prices are as low as quoted elsewhere—they will not hesitate to carry them in stock.

The opportunity is yours to be a vital factor in the improvement of your local stores which will in turn greatly benefit the community as a whole and every individual residing in it.

committee on arrangements was: W. P. Bartlett, C. F. Collins, A. C. Merryman, Thos. Jacob, W. E. Sprott, J. K. Tuttle, Frank Daybell, C. W. Towt, C. B. Earhart, E. Barris and Dr. A. J. Cook.

The tractor, implement and orchard appliance exhibit which was a feature of the Los Angeles convention was repeated at Visalia, and the tractor display was a large and instructive one.

The sessions for women under direction of Miss Clark seem to be a permanent feature of these conventions and were given much better attention here than at Palo Alto.

tion among farmers for the marketing of farm produce has resulted in a very gratifying success, in others the degree has been relative and unfortunately in many others the attempts have met with disaster.

That cooperation is desirable is almost too patent to need comment, but it does appear that there is room for improvement in many of the details of handling the problems that are continually arising.

Taking into consideration the very large number of cooperative organizations in California, each fighting its own battles, attempting to solve the

More HOP Profits More Bales per Acre

Hop Growers who have taken advantage of our free service department have found it profitable. They have made money through our advice. We have shown them how to increase the number of bales per acre. What we have done for others we will do for you. Write us fully and frankly. Let us know the exact conditions you are working under. Send a sample of soil and we will tell you how we can help you. You will not be obligated in any way. We want every Hop Grower to know all about

Gaviota Fertilizer

How it increases land values while increasing the land's yield. We want to send you positive proof of the wonderful increases it has made. How it feeds the crops and improves their quality.

Read what Hop Men Say:

From a Grower in Sonoma County:—"After using HOP Brand for two years, I am thoroughly well satisfied with results both in production and quality."

Another Sonoma Hop Grower:—"I began using your HOP Fertilizer in 1911 and increased my yield from 180 bales to 378 bales."

From Sacramento County:—"I purchased HOP Fertilizer last year and have had splendid results."

Still Another From Sonoma County Says:—"HOP increased my crop from 8.36 bales per acre to 13.14 bales."

We will furnish the names of these men on application.

"The Care and Feeding of Crops"

is a little book that tells you in plain English some valuable truths about the correct way to put back into the soil those elements which the crops take out. It tells you how to increase the size of your crops and how to make your land more productive. Write today for a copy free.

DATES IN IMPERIAL VALLEY

Written for California Cultivator
By Paul Popenoe

AFTER 11 years of experiment the owners of the oldest date plantation in Imperial Valley (near Heber) have decided to give up, and have sold the palms to be moved to ranches near Indio in Coachella Valley.

It is natural that some of the Coachella people should attempt to make capital out of this fact, declaring that dates can not be grown successfully in Imperial Valley and that Coachella Valley is the one locality in California for the industry.

I regard such an inference as incorrect, and I think it would be a misfortune to the date industry should that inference become current. As my own date growing interests are all in Coachella Valley I can hardly be charged with partisan bias in defending Imperial.

It is a question of varieties. The palms at Heber were all of the variety Deglet Nur, which is at home in a fairly light soil and dry air. It comes from the oases of the African Sahara; it flourishes in the Coachella Valley; but it is not a great success in Arizona, and it has never, I am told, produced a single good, full crop in Imperial Valley.

Now the Heber plantation was laid out in the line of a drainage of air, where cool, moist air passed from the middle of August to December, causing dew that no good date would resist at the ripening stage.

Furthermore, the district in which the Heber plantation was laid out has about as stiff a soil as any in Imperial County. It is not easy to cultivate or irrigate properly. Any one familiar with the Deglet Nur would know at a glance that the Deglet Nur is unlikely to thrive in that locality. It might have done somewhat better around Brawley or El Centro where the soil is lighter. The attempt to grow it at Heber was foredoomed to failure and might well have been abandoned several years ago.

That is a very different thing from saying that Imperial Valley is not a good place in which to grow dates. I believe the lighter soils of it are a thoroughly good date country—provided the proper varieties are selected. In this belief I know I am in agreement with Bruce Drummond who represents the United States department of agriculture in the California date industry, and whose opinion on the subject is perhaps worth more than that of any other man.

To select varieties suited to the location is an elementary precaution that any careful grower, with the experience now available, would take.

And in my judgment the varieties which will succeed best in Imperial Valley are those from the Persian Gulf and Egypt where climatic and soil conditions are comparable. The Sahara back of Algeria whence have come most of the date varieties now in the United States, is altogether different.

Ten years from now I believe we will look back to the early history of the date industry and smile to think

how obsessed we were by these Algerian dates. It is hard even now to get a hearing for anything else.

Yet the experienced traveler knows that Algeria has very few good dates. For the Deglet Nur I have only words of praise; its greatest defect is that it will not grow in a sufficiently wide range of localities. But apart from that Algeria has some good dates, but no very good ones. The Persian Gulf region has vastly better dates which will soon be bearing in California and will then, I hope, be appreciated on their merits.

And Egypt, whose dates have been persistently ignored by us Californians for the last 20 years, certainly can furnish some varieties that will put the industry in Imperial Valley on a sound and highly profitable basis unless all the signs are misleading.

It is perhaps worth while to call especial attention to two of these varieties which seem to me of most promise for Imperial Valley. They are Hayani and Saidi.

The Hayani, which comes from lower Egypt and which in Arizona is usually called Birket al Hajji, is the most productive good variety that has yet been tested in the United States. At Tempe, Arizona, where there are a number of fine specimens, 200 or 250 pounds is not an unusual crop for it, and in addition it bears a prodigious number of offshoots. It is regular in bearing, the fruit matures evenly and loss is rare. At one time, F. H. Simons tells me, there was a drizzling rain for 48 hours, just as the Hayani was ripening. Under such conditions Deglet Nur and most other varieties would have perished the air for a mile around with the smell of fermenting dates. But not a berry of the Hayani was lost.

The fruit of this variety has been picked, packed and put on the market for three cents a pound. With such production we can defy the competition of any foreign district, no matter how cheap its labor.

The fruit hangs in huge clusters of a brilliant wine color; the individual berry is often two and one-half inches long. The flavor is good, the shipping qualities excellent. It ripens in the latter half of September in this country. The first Hayani palm to fruit in California bore a tiny cluster at Indio this year—just half a dozen dates as big as hens' eggs—when it was only three years old. But I am inclined to think this extraordinary variety could be grown to better advantage in Imperial Valley than anywhere else in America.

The second variety to which I wish to call attention is Saidi, which comes from the Libyan oases of Egypt. It is doing admirably at Mecca, but there is reason to believe that it would do better in a heavier soil, such as parts of Imperial Valley would furnish.

The variety has, so far as yet appears, no drawbacks. The offshoots grow well, they come into bearing fairly early and bear heavily, ripening their fruit about September 1. The berries keep and ship extraordinarily well, if properly handled, although the skin is somewhat tender. It can not compete with Hayani in prolificness, but after it reaches full maturity should bear 100 pounds a year.

The fruit is light and attractive in color, the flavor rich and sweet. It is an immense favorite in Egypt, and deservedly so. When better known I believe it will be a great favorite in the United States.

I have mentioned these two varieties because I think they are too little appreciated and would do particularly well in the Imperial Valley. There are plenty of other good varieties for that section. Imperial County can become a great producer of dates and I hope that none of its growers will make the mistake of becoming discouraged because this first experiment has failed.

Now is the Time to Install Your Irrigation System

With the price of alfalfa soaring to between \$18 and \$20 a ton in most localities, a golden opportunity for money-making is presented to the Western rancher.

Alfalfa cannot be raised advantageously without an efficient Irrigation System—and now is the time to install your system to the best advantage.

Secure the advice of our experts—free. Interesting literature, invaluable to every rancher, on request.

MARKETING OF CITRUS FRUITS Address By Hobart Webster Before

State Fruit Growers' Convention
at Visalia

HY are we here to discuss the question of the marketing of citrus fruits? Discussion implies unrest, a desire to improve. We must, therefore, conclude that the present results which we are obtaining in marketing our citrus fruits are not satisfactory.

It is not necessary to make any extended remarks on the financial situation and its effect on the citrus market. We all know that there is to be a certain amount of allowance made for failure to get remunerative prices when times are dull. Any production of a semi-luxury class, such as citrus fruits, is more affected by financial conditions than are those articles of food which are considered essentials.

The conditions other than financial are that we have an industry in which is invested a large amount of capital, the cost of maintenance is heavy, and the income is not proportionate to the capital invested. We cannot close down, as can the manufacturer, put a watchman in charge, and await a change; we must continue to expend large sums for maintenance regardless of the net income.

We seem to be threatened with an overproduction of a fruit which is not a food necessity, is perishable, and has to be marketed a long way from the point of production. It is a question whether we have a case of actual overproduction or whether we are face to face with poor distribution, owing to a large number of shippers whose different interests cause severe competition among the growers. A large share of the force that should be used in expanding the trade is being consumed in pitting the interests of the growers against each other. We should not cry overproduction until we, as growers, stop this waste.

Undoubtedly we should have no cry of overproduction if every dollar now being used to create competition were spent in increasing the consumption of our citrus fruits until every man, woman and child has had an opportunity to purchase them at a minimum price consistent with the most efficient means of production and distribution, plus a reasonable profit. If we have met these conditions and cannot market our fruit at a profit we have overproduction and the weak must go to the wall. We have had the cry of overproduction periodically ever since the output reached 1000 cars. It is no new situation, and with a proper system of distribution of all our citrus fruits, there is no doubt that the growers will continue to be able to find a market at a profit under normal financial conditions; but we are so much nearer the margin of overproduction than heretofore that it will take a much larger percentage of the growers to bring about successful distribution than it has required to solve the many other problems which they have met successfully.

The question of efficiency in distribution hinges on the mediums of marketing, of which at present we have two; namely, the Independents and the Exchange. At this point it is necessary to compare the interests of these two mediums and see which should be the more likely to be of greater assistance in helping to solve the question of a better system of distribution.

The Independents are in business to pack and market the fruit of the growers at a stipulated price; the sole object of which is to make money for themselves, thereby adding another middleman's profit to be deducted before the grower gets his money. The Independents are made up of a number of different firms, each shipping independently of the others, consequently, there is no system to their distribution collectively, and if the field were left open to them we have no reason to believe that they would maintain any universal system of distribution.

Another feature which must be considered in wide distribution is that to secure the best results it is necessary to maintain a standard package and brand for same, which shall signify the quality, and to be able to supply this package in large quantities

Experience is an

all important factor in the manufacture of Orchard Sprays. When experience is combined with the best obtainable materials and a thorough knowledge of the proper proportions which are most effective in controlling orchard pests, the result is Orchard Brand Spray Material.

ORCHARD BRAND Lime Sulphur Solution, Atomic Sulphur and Bordeaux Mixture are uniform and of proper consistency, dependable in quality and give results.

Crude Oil Emulsion and Miscible Oil are especially prepared for killing scale insects and aphid eggs.

ORCHARD BRAND Arsenate of Lead Paste is a standard poison for killing chewing insects.

When writing our Free Information Bureau, give the age, number and kind of trees and describe fully the pest which you wish to control.

so that an extensive trade may be worked up. The great number of Independents' brands, each placed upon the market individually, does not create any general demand for California fruit of a definite quality.

Again, if you stop to think you will realize that not a single Independent packer that is now in business was in business, at least under the same name, a few years ago. To the onlooker they produce a sort of kaleidoscopic effect, which is certainly not conducive to stability where large trade expansion is of prime importance.

In referring to the other marketing medium, the California Fruit Growers' Exchange, it is considered simply as representing the cooperative idea, that its policy is entirely in the hands of the growers and is subject to change to meet the varying conditions that may arise. What the policy is this year may be entirely changed by conditions next year, as the growers themselves see the need. Whenever you hear a grower say that he would be in the Exchange, if its policy were different on this, that, or the other thing, you may simply label him as a man who has no faith in his own convictions, for if his ideas are superior he will not find much trouble in securing their adoption.

The basic principle of cooperation is class selfishness. By cooperation the citrus growers desire to get their fruit from the trees to the market without paying any profit to packing and commission men, but to perform this service themselves at cost, and at the same time secure more efficiency. Many growers hope ultimately, through cooperation with other producers of California fruits, to reach the consumer directly. In other words, the growers, many of whom are men of wide business experience, desire to handle their own business collectively through cooperation and thus be able to meet, thwart, or absorb such opposing forces as menace the best interests of the industry. Thus have been met successfully these side issues through the action of the growers themselves and not through assessment by those higher up, as some

would wish the uninformed growers to believe. Besides doing this they have provided the necessary funds to carry forward the best interests of the industry, as well as to build, equip, maintain and operate their own packing houses, and still make larger returns to themselves as growers than have those who have shipped through other agencies and have no packing house property but are still indirect renters.

While the Exchange, representing last year 62½ per cent of the output of citrus fruits of this state, has solved most of the perplexing questions for the benefit of the industry, and although this per cent of the fruit is systematically distributed, there is that other 37½ per cent divided among a number of independent agencies, and you can no more tell where they are going to land with a few cars, and upset the distribution, than you can tell where those mosquitoes, buzzing around you in the dark, are going to strike next. Thus, nearly two-thirds of all the fruit is systematically distributed only to be upset by the other one-third, often resulting in demoralization of the market. It would not seem possible to the unbiased observer that it would take long for all growers to see that the two-thirds, with a well organized system of distribution, must be on the right track.

Some attempts have been made to find a common ground for uniting the interests of the Independents and Exchange forces on the question of distribution, but without success. It does not seem reasonable to suppose that they could find any common ground for the permanent agreement of two such opposing interests. The Independents are working to make money out of the growers; the Exchange is working to save money for the growers; and with such diverse interests these two opposing forces cannot unite successfully on this most difficult question of all, the question of distribution.

While there is a decided movement towards universal cooperation of the growers, such action is being greatly retarded by various causes which we would indicate as indifference, misin-

formation and prejudice on the part of the growers, together with a lack of concerted action by those already organized cooperatively. All Exchange growers must be aroused to the fact that whether their section is 50 per cent, or 100 per cent cooperative, it is just as much to the advantage of the one as the other that all growers join in an effort to make the 50 per cent section into a 100 per cent section, if we are to secure the most efficient distribution of our fruits.

The Exchange has spent large sums in advertising to increase the consumption of citrus fruits, while the Independents have expended their efforts on this end trying to increase the number of their patrons and thus secure to themselves more profits, which would result in increasing competition among the growers to their own detriment and adding confusion to distribution.

At this time there is no doubt that it will be advantageous to the growers to inaugurate a campaign of education along cooperative lines to arouse the interests of all, whether grower, business man, or laborer to the importance of boosting for cooperation, as it means more money for the grower to spend among all classes. Therefore, much as we deplore spending money for this purpose, it seems necessary to do so, that the industry may be carried quickly to a position where distribution will be under one head and systematized.

With a national marketing law cooperation would be still necessary to secure any real benefit, as has been shown under the New York state marketing law. Even the peach growers

of New Jersey have at last realized that cooperation is greatly to their advantage although they are at the threshold of the largest market in this country. It certainly seems that little argument would be required to convince any grower 2000 miles from market that it is even more necessary for him to cooperate with his neighbor.

I would now say to the grower, instead of wasting valuable time, energy and money in opposing cooperation because you think it is not conducted in the right way, would it not be much wiser for you to enter into the movement and, if your ideas have as much value as you place upon them, convince the other growers of the correctness of your views and thus add your quota to the good of the cause? You can do more good to any cause by getting inside and giving judicious criticism than you can do by staying outside and being an obstructionist.

Suppose that instead of numerous agents running about the country seeking business, which only creates competition and expense for the growers, we were all united into one cooperative organization; that the money now being wasted were spent on scientific help, or used in increasing the consumption of our citrus fruits; that in our organization meetings, or wherever individual growers were congregated, we had no need to discuss membership and how to secure it; but instead we were to discuss efficiency in production and distribution; does it require a great stretch of imagination to see us as we then should be, a well satisfied group of citrus growers?

Walnut By-Products

Written for California Cultivator By J. G. Berneke

WHAT to do with walnut culls and low off-grade nuts has become a more serious problem each year since the output has increased each year in proportion to the output of the merchantable nuts. The grower is

naturally anxious that the culls should help to pay the expenses of the ranch. Perhaps the walnut growers' problem as to the disposal of his culls is not so large nor so serious as that of the orange

grower, but each is trying to solve it as best he may.

In a small way there has been an opening for walnut culls. Some growers have cracked them and sold the meats locally to confectioners and bakers. This outlet is naturally quite limited. A small business has been established for cracking culls and shipping the meats to Eastern buyers. A few established buyers of culls and meats, and peddlers calling at the grower's home for culls, have helped to take care of the output. Not only have prices been unsatisfactory, but the output was not entirely taken care of if it was at all large.

Attention was called to this condition about three years ago and the associations urged to take hold of this matter for their members. The suggestion made at that time was for each association to establish a walnut cracker, but to sell the meats through its central agency at Los Angeles. This year the associations established a walnut cracker in Los Angeles to serve the members of all associations. Centering the effort at one point may prove the better way. We must remember that this is still in an experimental stage, and time must elapse before a final decision can be made. It might prove more practicable for the larger associations to have their own cracker and ship the meats to the central house for grading and packing. Meanwhile we may feel that a step in the right direction has been taken and that improvements will be made as experience shall dictate.

A visit to the walnut cracker at the Walnut Growers' Association headquarters in Los Angeles recently revealed a beehive of activity. About 150 women and girls were seated at long tables, sorting and grading walnut meats. The culls are poured into a hopper, and an endless conveyor belt carries them into a grading drum. The different sizes drop into different compartments and go on to their respective rollers where they are cracked and the bulk of the shells fanned out. The meats run into a sack and are carried to the long tables, where the women sort them into four grades. They are packed in 25-pound boxes. It is proposed also to put some up for the family trade in half and one-pound packages. It is probable that the smaller package will prove the more popular. This is the case with the walnut packages. I was informed that orders had been received for nearly 3,000,000 of the California Diamond brand walnut cartons, 93 per cent for the one-pound size, and seven per cent for the two-pound size. This attractive package was illustrated and described by the California Cultivator about two months ago.

There is a suggestion for the sale of white halves which are so eagerly sought in the making of walnut candies. A small carton with isinglass window, holding four ounces; the carton of appropriate color and design to set off the white walnut meats, the carton to be nearly filled with meats, leaving room for the facing layer, which is to be seen through the window. Between the filling and the facing layer is placed a small booklet of recipes for the use of walnut meats. This booklet must of course just nicely fit the box. Whether the facing is put in first or last can be learned by a little experimenting.

There is certainly good reason to think that when walnut meats are offered to the public in this attractive form the demand will become nearly as active as it has in the case of the walnut packages.

The prices on walnut meats f. o. b. Los Angeles, as they were given me, may be said to be quite satisfactory, and this experiment promises success after the first difficulties shall have been overcome.

The use of nuts for food is coming into greater favor and will increase if walnut meats are in attractive and sanitary packages, with contents properly labeled and guaranteed. The instructions for use of walnuts are quite essential because the public must be educated up to it first.

The combination of ground walnut meats and fruits, e.g. canned or preserved figs, apricots, etc., makes a delicious and wholesome repast, and a little experimenting would teach us

how to guard against spoilage. Here are lines of research which might be profitably followed by our experiment

stations for the benefit of both walnut and fruit growers.

Walnut candies might also consti-

tute one of the by-products. We produce both the sugar and the walnuts in California.

"Behind each tree is our guarantee"

It looks as though there was going to be a greater shortage this year than ever before in trees of the best selling varieties. To avoid disappointment, send us a list of what you want and take advantage of the prices we make to those who order early.

It Pays to Plant Foothill Grown Trees

We recommend them for hardiness; for good, well-branched roots; for freedom from root knots; for freedom from disease. They are superior to trees grown on the river-bottom and valley-loam locations commonly chosen by nurserymen. That is why so many successful fruit ranchers buy all their stock from us. We grow a complete assortment of all varieties of citrus and deciduous fruit trees and vines.

When you buy from us you are buying from a firm who are fruit growers and shippers as well as nurserymen.

We know all the troubles of the fruit grower and can offer him a service that he can not get elsewhere. Our knowledge is first hand—we learned by experience, and this experience is yours free—for the asking. Write us—tell us your troubles. We may be able to help you.

Here Are Some of Our Big Paying Specialties

Prunes

Selling now at a 5c basis, are again demonstrating that of all fruit grown they are the most stable for profit. There is always a shortage of trees in FRENCH, IMPERIAL, ROBE DE SARGENT, SUGAR AND STANDARD ON MYROBOLAN ROOT. These are the best selling varieties this year and there will again be a shortage. We have a fine block of trees on Myrobolan root in each of the varieties named—foothill grown—selected in propagating—fine, hardy trees.

Write us for prices and get your order in at once while the trees can be reserved for you.

Cherries

Cherries are great money-makers in California, and on locations adapted to their culture they are as good as you can plant. There is often a shortage of trees in the best varieties. We have a good stock on both Mahaleb and Mazzard root, and if placed now can take care of your orders in any of the following: ROYAL ANNE, EARLY BURBANK, EARLY CHAPMAN, EARLY PURPLE GUIGNE, BLACK TARTARIAN, BING, LAMBERT AND BLACK OREGON.

Walnuts

When you buy a Walnut, more than any other tree, in view of the variations from the true type, you want a tree pedigree and true. Our scions of Franquet and San Jose Mayette are cut by the pioneer walnut expert of the State, R. Wiltz of San Jose, and from trees he has had under his personal observation for years and which are of the true type and selected for performance. This is the highest pedigree given a walnut. Write us at once for full information and prices.

Shipping Plums

We have a complete assortment of every standard variety of Shipping Plums on Myrobolan root, Bitter Almond and Peach root. Write for our catalog, giving complete and accurate information concerning every variety of Shipping Plums. Let us have a list of your wants for prices. Place your order now while our assortment is complete.

Pears

On both Standard French and Japanese root. We have a fine block of trees, well rooted and hardy, in Wilder, Lawson, Bartlett and all of the later standard fall varieties.

BARTLETT PEARS, as well as all of the standard Fall Pears, have this year made a good record for the California grower, as they do every year. No fruit more profitable or with a better future.

OUR BIG BARGAIN OFFER TEN SELECTED TREES \$3.95

We take such pride in this selection that we have named it

Bergtholdt's Special Selection for Home Orchard

It consists of ten best grade 4/6 foot deciduous fruit trees, including one grafted walnut. This will all be delivered at your postoffice address, freight prepaid. You can make your own selection or leave it to our judgment, and we will give you a fine selection of the very best varieties for a home orchard.

Take advantage of this low offer at once and secure \$3.95

a home orchard that you will be proud of for only \$3.95. Write for our list of combination offers for home planting and our free booklet on California fruit which gives you an accurate description of each variety. Write us a list of your wants for prices—DO IT NOW.

SILVA-BERGTHOLDT CO. Box B, Newcastle, Cal.

Apricots

California has the monopoly in the production of this fruit, always profitable, and future prospects never better. There is usually a shortage, particularly of Apricots on Myrobolan root for planting on heavy loam or poorly drained locations. We have a fine block of Apricots on Myrobolan root in all varieties, as well as on Apricot and Peach root.

Olives

We are offering a limited number of trees of Mission Olives worked on Picholine root. Write us now and get in on this stock. We have also an assortment of varieties grown from cuttings.

Almonds

Are in great demand and there will be a shortage. We have a fine block of trees on Bitter Almond and Peach root in all the standard varieties.

Clingstone Peaches

This year's crop suffered from war conditions, but canners are cleaned up and are sorry now they did not make a larger pack. Bear in mind the California Clingstone has a monopoly of the world's market for canned peaches—regularly productive, can be successfully grown nearly everywhere—a good money-maker in the past and will keep up this record in future. OUR IMPROVED TUSCAN is preferable in every way to the common Tuscan in the following features:

- 1st—More regularly productive.
- 2nd—Perfectly round; uniform size and symmetry.
- 3rd—They do not split pit.
- 4th—They do not gum.
- 5th—They do not windfall.
- 6th—They are fine grain, of superior canning quality and command a premium of from two to five dollars per ton over the ordinary Tuscan.

Hauss Cling Peaches

A seedling from Phillip Cling, and has all the desirable features of that splendid variety. Ripens immediately after the Tuscan, filling the intermission between the Tuscan and Phillip when canners are running light and always command a premium. Identical to Phillips in quality and productiveness.

Phillips Cling Peaches

Our Phillips Cling are of the true type and but one generation removed from the Phillips Cling first introduced. Very few are aware of the fact that the Phillips Cling, as commonly propagated, is deteriorating from the true type in the successive propagations.

The "S-B-U" High-Pressure Power Sprayer

Built along advices of Horticultural Experts and prominent growers, to do "high pressure" work with wonderful results after fog-sprays and fumigation had failed.

Own your own High Pressure Spray Rig and be in a position to SPRAY WHEN YOU SHOULD. The right time to spray is at period of incubation or hatching of Tree Pests, don't compel yourself to rely on hired spraying or fumigation.

Write for Circulars "S No. 2".

Smith-Booth-Usher Company

228-238 Central Ave.

Los Angeles, Calif.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

Water Right

There is percolating water near some land I own, and it is in the forest reserve. Can a person condemn it for agricultural purpose or file on the water? It is supposed to be railroad section. Railroad never has had

title to it. One of my neighbors has been using the water from near this source for the past 20 years. What right has he other than squatter's right?—Subscriber, Redlands.

You are entitled to appropriate percolating waters subject to the provision that any other land holder whose waters are also supplied by such percolating waters may prevent you from taking the waters so appropriated to distant lands which do not overlie the common supply, if your taking is found to be injurious to him. Your neighbor has acquired by his use a right to the water which he has taken under Section 9 of the act of congress approved July 26th, 1886, if these lands are and at all times have been government lands.

Stray Stock

Can I collect for damages done by stray stock on a place that is not fenced? I took stock and fed them for 15 days before owner called for them. Can I collect for feeding?—Subscriber, Moorpark.

You could recover for the feed of the stock. It is impossible to state from facts given whether or not you would be entitled to recover for damages, however the presumption is that you would not.

Interest on Note

I purchased engine and pump, part cash and balance in notes. Verbal promise of delivery in a week or ten days. It was 30 days. Can interest be collected on notes for time between date of contract and delivery of goods. Contract refers to delays due to fire and transportation delays only. Above notes are payable "on or before" certain dates. I paid one "before" due, directing cancelled note to be returned at once. It is now 50 days since it was paid. Can I collect interest on note or the cash used in paying it, and what rate if I can?

Unless you could definitely show that time was the essence of the contract it does not appear that you could recover for the delay stated, as it would appear from your statement that a delivery was made at the selling place of the seller and that you assumed responsibility for carriage therefrom to your place, besides that, 30 days would hardly be considered an unreasonable time.

Horse Removed from Pasture

If B has a horse in A's pasture and C, who has a horse in the same pasture, takes B's horse out by mistake and B rides about five days to find the horse could B collect from C or A for the time he spent hunting his horse?—Subscriber.

The keeper of the pasture was at fault in permitting the horse of B to be taken out, and B would have to look no further than the keeper of the pasture for the time lost and expense incurred by him in finding his horse.

Oral Lease

B orally agreed to lease a ranch to A for term of two years, rent payable every quarter in advance. Subsequently B refused to execute written lease and required only one and one-half months' payment in advance and at same time orally notified A that upon the date to which his rent was paid he would be required to vacate. Has A the right to a written notice to vacate?—Subscriber.

An oral lease of real property for a period of more than one year is invalid and cannot be enforced. In order that B may legally eject A from the premises he must serve him with notice in writing at the end of the expiration of the period to which he has paid his rent, requiring him to deliver up the premises within three days. This notice is prerequisite to any action being brought by the landlord to enforce the delivery of the premises.

Tenant Selling Fertilizer

Can a renter haul off and sell fertilizer if nothing is mentioned in the lease about it? Barn yard fertilizer or bean straw?

A tenant is entitled unless the lease otherwise provides to sell fertilizer from the land.

Save Money on Wire Fencing!

-send for WHITING-MEAD'S Free 1915 catalog showing how to save 20% to 40% on Building Material

Warner Fencing \$4.10, \$4.90, \$5.55 per Roll, for Stock and Poultry

This class of fencing is known all over the country and usually sells for considerably more. First placed on the market some ten years ago to meet the demand for a substantial combination stock and poultry fencing.

It is closely woven and made of No. 14 galvanized wire, the spaces between the wires being graduated from the small mesh at bottom to keep chickens in, to the regular stock fence mesh at top. Has heavy cable edge at top and bottom, which enables it to withstand sudden shocks without injuring the fence.

Ten rods to roll and sold in full rolls only.

Height inches	Approx. Wt. per rod	Stays inches	Bars number	Price per roll
35	7	6	15	\$4.10
45	8	6	17	4.90
55	9.2	6	20	5.55

POULTRY FENCING \$3.25, \$3.60, \$4.30, \$4.90 PER ROLL—GRADUATED MESH—GALVANIZED

Has many advantages over the ordinary poultry netting, being three times as strong, does not require a top or bottom board, as the selvege wire at top and bottom may be stretched to give perfect close fit to ground, and the top affords no place for chicken to rest.

All the features of the popular heavier fencing, including the interlocking mesh, with special graduated mesh to keep small chickens in. Sold in full rolls. 3 ft. high, \$3.25; 4 ft. high, \$3.60; 5 ft. high, \$4.30, and 6 ft. high, \$4.90.

WARNER HOG FENCING \$5.00

Specially woven hog fencing, with barb wire selvege at bottom, which effectually prevents hogs raising the fence, and does away with the necessity for and expense of bottom boards.

Made of best quality No. 14 galvanized wire, height 26 inches; weight per rod 4.5; stays, 6 inches; with 7 bars barbed at bottom. Sold in 20-rod rolls only, \$5.

POULTRY NETTING 45c, 60c, \$1.10

GALVANIZED—2 IN., 1 1/2 IN., and 1 IN. MESH.

A great special buy, amounting to almost a full carload, in these much wanted sizes. Remember, it's all perfect in every way.

1 in. mesh, \$1.10 per 100 sq. ft., 18, 24, 36 and 48 inches high. 1 1/2 in. mesh, 68c per 100 sq. ft., 24 inches high only. 2 in. mesh, 45c per 100 sq. ft., 18, 24, 36 and 72 inches high.

These prices will apply only so long as this lot remains in stock, so get your orders in early as they will be filled subject to stock on hand.

FENCE STRETCHER AND COMBINED HOIST \$1.25

A most necessary tool in erecting wire fences and very handy to have on the farm at all times.

May be used as a lifting hoist, similar to block and tackle, has automatic catch which holds wire or load at height required. Thousands in successful use. Two sizes, \$1.25 and \$1.50 each.

"Standard" Roofing Paper

A splendid quality of roofing paper that most farms would sell 20 to 40 per cent higher. Each roll complete with necessary cement nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet	\$1.15
2-ply, double-sanded, per roll of 108 square feet	\$1.40
3-ply, double-sanded, per roll of 108 square feet	\$1.65
1-ply "King" smooth, per roll of 108 square feet	\$1.25
2-ply "King" smooth, per roll of 108 square feet	\$1.50
3-ply "King" smooth, per roll of 108 square feet	\$1.75

PAINTS! PAINTS! PAINTS! WE BEAT 'EM ALL PRICES

Our paint department is now in full swing, a complete stock having reached us since the recent fire. We can give you the lowest prices ever on paints, brushes and painting supplies.

Standard House and Floor Paint \$1.50 gallon.

Standard Porch Paint \$1.75 per gallon.

Black Graphite Roof Paint 50c gallon in 5 gallon lots.

Standard Shingle Stain 50c gallon in 5 gallon lots. All colors except grey.

Oregon Pine \$10 to \$15

Good new rough Oregon Pine Lumber, all sizes, at \$10 to \$15 per thousand.

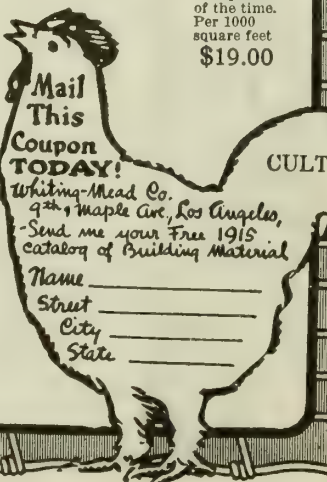

Oregon Pine Lath, 4 ft., new, \$2.50 per thousand.

Best grade Slashed Grain Oregon Pine, sanded finish, \$37.50 per thousand. This makes a beautiful interior finish.

These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

\$30 Wallboard \$19.00

The highest grade wallboard on the market, made of 3 layers of moisture-proof fibre, with asphaltum between each layer; or cream white fibre board. Cheaper and neater than plaster or lumber and any one can install it in one-quarter of the time. Per 1000 square feet \$19.00

FRUIT GROWERS' CONVENTION

Continued from Page 507

price of a season than the man who buys from the farmers for resale.

Most of the farm produce should be put upon the market in a finished condition by the farmer or he should pay someone to do it for him. If the ones he pays to finish his product abuse the chance and improve the opportunity for speculation, the farmer will have to take into his own hands the

preparation of his products in a merchantable condition and attend to the marketing of them. The farmer who sells the product of a year's toil, having contended with the many obstacles of pest, disease and the uncertain results of climatic conditions, in one sale, does not have a fair chance at profitable returns, but if through his cooperative organization he can be consistently in the market over a period of time he is reasonably certain of making a profit if the law of supply and demand can operate.

The greatest handicap under which young organizations especially have to work is a lack of the proper financial arrangements that will enable them to make advances to growers upon delivery of their crops for sale. The average non-cooperative farmer in California is willing to concede that cooperation is the proper thing for him, but his usual reason for staying outside is that he cannot get his money when he delivers his crop. To make advances to growers requires

handicapped work to reach it, and it is surely more desirable to have the products of the farm come quickly into cooperative hands than to have a smaller percentage supporting a long and painful struggle.

The sooner we can get the majority of California farmers into cooperative organizations for the handling and marketing of their products, the sooner will a greater prosperity come to the state, and the quicker we make it possible for the organizations to obtain the proper credit, proportionately we make our land values higher and our income more.

It is of no concern to the men who buy the products of the farm for re-handling at a profit if the farmer is making money; it is often to the buyer's advantage if the farmer is losing, for he can drive a better bargain with a sorely pressed man. It is of the greatest concern to the mass of our people that the farmer should prosper.

The tremendous problem of getting a fairer share of the consumers' dollar to the farmer is being worked upon by many of our brainiest men. How much easier would their task be-

PEACH GROWERS OF CALIFORNIA:

The undersigned committee, appointed by the regular state committee on organization of the Million Dollar Peach Company, appeals to you to sign the subscription list of the proposed company on or before November 27.

We are arranging to hold mass meetings in all the peach growing districts of the state on Saturday, November 27, and most earnestly ask you to attend your local meeting and sign your acreage on the basis of \$20 an acre, to enable you as a grower to incorporate your company within the time limit which expires January 1, 1916.

How much longer shall we growers compete against one another in disposing of our peaches? Don't wait for your neighbor, but sign up and then have him do likewise before the close of November 27, and help correct the evils that have brought our peach industry to the verge of ruin.—T. B. McKelvey, Wm. Robertson, M. H. Bixby, F. H. Wilson, John C. Rorden, Ray Humphreys, W. J. Wilson, Committee.

proper credit. With proper credit accommodations for short time loans the cooperative body, well organized and managed, can control 60 per cent and more of the crop in its vicinity.

Short time loans is a phase of rural credits that is possible to put into effective operation by the united efforts of the various growers' organizations of the state. If the growers' cooperative bodies can get the proper short time loans, cooperation in California will come into its own and the balances can be put upon the proper side of the ledger for our farmers.

The greatest objection from a farmer's view point to cooperation is the fact that it is not possible to have all or a large portion of the money from a crop when it is delivered. Many farmers can wait and are so situated that they can get accommodations from their banks on their personal security, but unfortunately many farmers, needing the aid of cooperation, have to sell their crops when they can and at the price they are able to get. Of course transactions of this sort make it doubly hard for the organized farmers to operate. If we can put our products on the market throughout the season better average prices can be obtained and the law of supply and demand be given a chance to become effective.

To eliminate speculation we must organize; to organize before we reach the starvation point we need proper credit. It is a sad commentary that many growers have to go through the direst need before they awaken to the necessity for cooperation. Many of us do not want to wait until we have reached the starvation point before we put up our last dollar into funds for financing our organizations. We can use the money to very good advantage in cultural improvements.

If we can get an advance payment upon our crops at the time of delivery of sufficient money to pay for the harvesting, and within 30 to 60 days receive 50 per cent of the value, we can do most of our own financing; but to get the advance upon our crops, which can be secured by warehouse receipts or community security, is the present urgent need of the average cooperative society.

Many organizations in the state have reached the happy place where they have little or no difficulty in securing the proper accommodations, but it has usually taken years of hard,

come if we could control the products of the farms of the state in our growers' organizations.

A proper realization of the necessity of short time loans, a realization of a plan that will make such loans desirable, will give a wonderful impetus to cooperative efforts.

We will have rural credits in California notwithstanding a defeat recently at the polls, but let us unite now to secure that kind of rural credit that will enable our cooperative organizations to successfully compete with the men who have been piling up profits out of handling and reselling our goods.

If we have a board of examiners, a commission or a committee selected from a league formed by cooperative bodies of the state, versed in financial matters, conservative and just, who will make examinations into the affairs of our cooperative organizations and pass upon the amount of credit they should be entitled to, and take such steps to see that the credit is obtained, a better understanding of the desirability of this sort of credit will be a resultant.

In loaning money to cooperative organizations there is one very important feature that should not be overlooked: In loaning money on growers' products in warehouses or in the control of the selling organizations, the goods are owned, and while a grower may take a lower price he is not going to lose money on that particular product in a speculative way for it is not bought with borrowed money to sell at an advanced price.

As a rule the country banks will loan money to growers properly organized and managed, but the city banker, from whom the large amounts necessarily must be obtained, has little knowledge of, or sympathy with, this sort of security. The city banker is not altogether to be censured for his skepticism, and it is readily to be understood why a body of farmers loosely organized and easily stampeded by the attacks of those whose interest does not lie in cooperation for farmers cannot offer the security most readily convertible; but we as farmers contend that when well organized, with valid contracts between grower and organization, we offer a security doubly good, for it has not only a community real estate backing, but has a tremendous moral force behind it.

USES OF VINES

Written for California Cultivator By Ernest Braunton

THE uses of vines are many and their value lies in their ability to quickly cover objects that are unsightly, to serve as screens and to embellish and give finish to various styles of architecture. The latter use is the nobler one. There is no other class of vegetation that will qualify for similar uses and none that will so quickly hide large objects, for trees of a sufficient size to attain like results would require many times the number of years necessary to the vine. Likewise are vines, properly used, one of the best of materials for making attractive the home and surroundings. When one views an unattractive house or other unsightly building, notes naked rubbish heaps, unmasked clothes lines and other objects more or less unbecoming at the rear of houses he cannot but marvel at the shiftlessness of the owner when vines that would obscure are so cheap and obtainable everywhere. In pleasing contrast do we note pergolas, arbors, covered seats, fences and other objects built for the express purpose of growing vines upon. How often are huge stumps, rock piles, etc., changed from ugliness into beauty by the generous use of vines. How often in nature when trees die or man burns the fair face of nature do the native vines respond to repair the damage.

Vines are as varying in habits as are members of the human family. Some wish to grow aloft and will ascend any upright object, while others will persist in remaining under foot and sprawling over the ground. Some climb by simply twisting their stems about various objects. Some have tendrils for the special purpose of climbing; these are the true vines. Others climb by leaf-stems or petioles, while still others have aerial rootlets or have sucker-like disks that will almost fasten on smooth glass. It is an odd fact that those that adhere by rootlets do not twine, or seek other means of support, but grow straight up, evidently scorning all other classes of vines as being inferior in that they need aid or assistance in their ascent. Another curious character is that while the hop will twine around with the sun, the bean and morning glory and nearly all others twine in the opposite direction. Cooperation is well illustrated in cases where vines grow above the support provided. They will twine many stems into one, which latter, so stiffened, will ascend to the point where supports are again within reach. Then will each stem again assert its individuality and climb by itself, alone and unaided.

Chrysanthemum Buds

Numbers of people have told me that they do not understand the 'mum growers' catalogs when they speak of crown and terminal buds, and one said she could not distinguish between them after reading descriptions in my garden book. Well, here goes for another trial at plain English.

The crown bud is a solitary bud, the first to appear, on the top of each stem, before branching starts. Terminal buds appear in clusters at the ends of the later branches, thus terminating the season's growth. As a general rule the largest flowers are from the crown buds, though there are a few exceptions.

Care in Transplanting

Watch carefully over all transplanted subjects for at least several days. Too many take a plant home, put it in the soil, water it once, and because it revives through this watering, conclude it is thoroughly established and no more care is needed. On looking at the plant a few days or a week later the planter is greatly

surprised to find it is dead. Some think it the work of a gopher, but it is due to the absence of "go for." The initial revival was like the cry of the Roman gladiators "Morituri te salutamus." "We, about to die, salute thee." In some soils as the water dries away the soil contracts and leaves an air space all about the stem and main roots. A firming of the soil and another watering is thereby indicated.

A Dry Soil Iris

Every year I hear complaints of ill success with Iris Susiana which should be called "the gloomy iris" and regarded merely as a curiosity albeit the blossoms are the largest of all. This oriental sort likes a heavy soil in a hot, dry place, for heat alone will make for size and vigor. When left in the soil over winter the roots of this sort quickly perish through excess of soil moisture. When past blooming keep them as dry as possible and when tops yellow remove from soil and dry thoroughly. They are very tenacious of life and will grow quickly if withered, wrinkled, and leathery in texture.

Success with Roses

Many cases of ill health in roses which I have closely investigated have been due to lack of drainage. While roses like a heavy soil, this does not mean a close, undrained one, for the plants will not thrive with wet feet. If the drainage is good the heavier the soil the better will be the roses. Four feet of rich but very heavy soil would produce a wonderful lot of flowers even though the ten feet next below was of solid fruit cans and rubbish or broken brick and stone.

House Plants

Why should we have house plants in California? Porch plants are permissible, for I would not discourage pot plants though I have none myself. I aim to have enough in the garden so that pot plants would prove no source of pleasure to the better half of the household. But flowers; have them everywhere, indoors and out—have a dozen vases about the house if you have room for them. If you will have porch plants over which to exercise a tender care, very well. But all will grow better in the garden with one-fourth the care, except it be in colder parts of California.

Summer Arbors

When contemplating summer retreats and seasonal shade keep in mind a framework for an arbor covered with the chayote vine. It will grow vigorously all summer and in autumn give you a fine crop of most excellent squashes, for the chayote is but a one-seeded squash, the only plant of its kind in the great family of melons, cucumbers and the like. The fruits may be used in every way that squash is used and have as much food value as the best. I have seen many arbors covered with this vine and all were satisfactory. When frosts come the chayote usually retires to private life until spring.

House Borders

If no other planting be done about the house do not neglect the border close about the house. If this angle, made by the ground and the house walls is filled making an easy and smooth transition from architecture to nature, the effect of the whole can scarcely be displeasing. Shrubs of small growth are better than herbaceous plants for the latter should be but incidentals in the scheme of planting. The higher the floor from the soil the larger should the shrubs be. It is especially desirable to fill in heavily on each side of steps and in corners of the house.

Wild Flowers

Once again let me urge you to grow

a wild flower garden, and now is the time to prepare it. If you will try this scheme just once it will be proved for ever and aye, for the charm of such a plot is an ever-changing yet sufficient one. Every week will bring a new crop, new flowers, new color scheme, a perfect floral kaleidoscope. Being native, and therefore peculiarly fitted to local conditions, all plants will enjoy the best of health for you need do nothing for them after planting. Sunshine and rain will provide every necessity and the results will fully satisfy.

Questions

THE EDITOR

and Answers

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Tepary Bean

Is the tepary bean valuable as a marketable bean locally?—Subscriber, Fullerton.

The tepary has yet to make a place for itself in the market. It will do it for it is an excellent bean with a flavor which is usually preferred to that of the white navy, which it resembles. The larger markets have been approached as to quotations, but no one seems to have very definite ideas as to its place. So far it is usually quoted and sold as white navy. We think planters should use care in selecting seed, and if the white is preferred, select only the whitest and best of seeds. It must be borne in mind that while the tepary has been grown for a greater number of years in America than any other bean it is commercially new, and until its place in the market is established care must be taken in seed selection.

Gypsum—Lime

I am told that gypsum loosens up the soil. Would it be desirable to put it on the orange orchard, and how much should be used?—Subscriber, Olive.

Gypsum is not so valuable to lighten up soils as is the ordinary slaked or sugar house lime. A still better "lightener" is coarse, strawy manure or similar mulch which allow the air to enter the soil, thus giving opportunity for bacterial activity. It must be borne in mind that the addition of chemicals alone to land, no matter how rich in the elements of fertility they are, does not necessarily increase its productiveness. Soil must contain sufficient vegetable material or in some way must be put in such condition that it will permit the introduction to it of air and moisture.

Stable Manure—Barley Straw

Have you reliable figures as to comparative value of a ton of stable manure which, when shipped to us here, costs in the neighborhood of \$2.50 per ton spread on the orchard, and a ton of ordinary barley straw in orchard, not spread, at \$7.50? I understand the fertilizer value of common bean straw is higher than grain straw.—Subscriber, Orange.

It is impossible to tell you the value of the stable manure which you are buying without knowledge of the feed of the stock which produces it. The value of plant food in a ton of average manure, according to Van Slyke, is about \$2.50 for horse, \$2.20 for cow, \$2.00 for pig, \$3.20 for sheep, \$2.35 for steer and \$4.40 for hen. Note we say "average manure". Where a horse is fed on grain and the bedding is so arranged as to absorb much of the liquid such manure has greater value. We are not able to turn to values of barley straw. Oat straw is quoted by Hopkins as having a value of \$3.30, wheat straw \$2.58. This would make it appear that \$7.50 per ton for barley straw would be higher than could be paid economically, but it must be borne in mind that the figures given are based on plant food value without

any reference to mulching and humus value. There is much more humus forming material in a ton of dry straw than there is in a ton of stable manure saturated with liquid. The value of bean straw is of course much greater than barley because of its higher nitrogen content. Its value from an analysis standpoint would possibly reach eight or nine dollars.

Pruning Grapes

Please give information regarding pruning grapes in the northern part of

the state.—Subscriber, Wyandotte, Butte County.

The location in the state is not a determining factor as to type of pruning so much as the matter of variety. We would suggest that the inquirer write the agricultural experiment station, Berkeley, and ask for Prof. Bioletti's bulletin on Vine Pruning in California. It is Number 24. Not so valuable but still of interest is Farmers' Bulletin 471, Grape Propagation, Pruning and Training, by Husmann, to be had if still in print by writing the United States department of agriculture, Washington, D. C.

Okra

Can okra be grown at Lindsay? Does it take much water? When and how is it planted? When does it ripen? Is there any market for it on this coast? Is it subject to pests? Is there any probability that a large

planting would be profitable?—Subscriber, Lindsay.

Yes, okra can be grown at Lindsay. Okra requires warm weather and as much water as corn. It is planted in the spring after all danger of frost is over—for safety this would be April 15. Plant sparsely in drills three to four feet apart. The young seed pods are what are used; these should be picked while they are still tender. The first of them should be ready to pick about the middle of August. The first frost will kill the plant. There is not a very extensive market here for okra; it is a Southern vegetable and its use is mostly restricted to persons of Southern tastes. It is but slightly troubled with aphids and mildew—but neither have yet been found bad enough to cause any alarm. Okra is grown here in half acre and acre patches where it is grown in the Southern states in ten-acre patches. It will stand shipments of a week's duration, so by putting out inquiries in cities within that distance one might develop quite a market.—D. F. R.

Power

- no car at the price has SO MUCH

Without a single exception, this new Studebaker 4-cylinder car at \$885 is the MOST POWERFUL car on the market at its price. Its motor, INCREASED in size from 3½ x 5 inches to 3⅞ x 5 inches, develops FULL 40 horse power. And the scores of improvements that have been made in the motor design, the high location of the carburetor, the 6-inch intake, the scientific design of the manifolds, make it not only far more responsive than ever before, but vibrationless and economical to a surprising extent.

In POWER and flexibility, this Studebaker FOUR equals most of the Sixes on the market. And in VALUE, dollar for dollar, it completely outclasses every other 4-cylinder car. For Studebaker has set a new standard of VALUE for Fours. Studebaker has lowered its price \$100—coming down from \$985 to \$885—and still INCREASED its POWER, size and quality. And wherever materials have been changed, BETTER materials have been used. The upholstery, for example, is the finest, hand-buffed, semi-glazed leather purchasable.

You know the sterling quality that name of Studebaker has always stood for. You know how thoroughly Studebaker is acquainted with the road conditions that the farmer must face. And you can appreciate what this car must be when we tell you that it is not only the GREATEST value of the season, but the best car that Studebaker has ever built. We urge you to see it before you decide on any car. The 1916 catalog will be mailed on request.

The California Cultivator is a Member of

Harry T. Evans, Steger
Building, Chicago, Ill.
S. E. Leith, Fifth Avenue
Building, New York
C. A. Cour, Globe Bldg.,
St. Louis, Mo.Entered at the Post Office at Los An-
geles, California, as Second-Class Matter.**Thursday Nov. 25, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**OLIVE MEN ORGANIZE**The organization of olive grow-
ers which has been adding to its
membership for several months is
now getting down to definite action
and has secured the services of Mr.
J. P. Dargitz, formerly of the Cured
Fruit Association and later of the
Almond Growers Association. Mr.
Dargitz has fullest understanding of
marketing conditions. Now if the
olive growers will establish a brand
that is worth advertising and adver-
tise it to the limit this state will keep
itself busy supplying the demand for
California ripe olives.**DOLLAR SERIES**It is most gratifying to see the
demand which is being made on the
publishers for the Cultivator's dollar
series, "Poultry for Profit" by Mrs.
Koethen and "The Garden Beautiful"
by Mr. Brauntun. Almost everyone
who has occasion to buy these books
has remarked, "How can you do it for
one dollar?" Large book dealers who
have looked them over and learned
the price express the same astonish-
ment. No more pleasing holiday
present could be made than one of
these books. Orders may be sent at
any time for delivery on a certain day.**PEACH DAY**The peach men of California
are making a whirlwind finish to their
campaign for members for their mil-
lion dollar corporation. Next Satur-
day is to be dedicated to the work of
getting members in every peach
growing section of the state. The call
issued by the committee appears in
the deciduous department of this
issue. This organization is to be built
along the lines of the Associated
Raisin Company, and while entirely
separate it is expected that it willaffiliate in such a way as to benefit
both organizations. We hope the
membership secured will bring within
the control of the organization 100 per
cent of the peaches of California.**THANKSGIVING DAY**This is the day which the
president of the United States has set
aside for all to join "in praise and
thanksgiving to Almighty God for his
many blessings and mercies to us as
a nation."The extraordinary circumstances
of such a time have done much to
quicken our national consciousness
and deepen and confirm our con-
fidence in the principle of peace and
freedom by which we have always
sought to be guided. Out of darkness
and perplexities have come firmer
counsels of policy and clearer percep-
tions of the essential welfare of the
nation. We have prospered while
other people were at war, but our
prosperity has been vouchsafed us, we
believe, only that we might the bet-
ter perform the functions which war
rendered it impossible for them to
perform."California has sent to Europe of its
best fruits and other products which
have been appreciated in trench and
hospital, and in spite of many unsat-
isfactory conditions the producers of
our state are prospered. There is
occasion for thankfulness in Califor-
nia above all other sections.**MORE RURAL CREDITS**It seems to take an immense
amount of resolving to bring any
practical results in the matter of
rural credits. The past two or three
years we have all been writing and
talking and dreaming of a bettering
of conditions of the producers of the
land by somewhat lightening their
burdens in one particular at least. An
opportunity was given for a long step
in the right direction at the recent
special election and had the producers
of the state themselves come out and
voted the question would have been
settled. But the vote was exception-
ally light, showing that there is need
for more education.To that end another national con-
ference on marketing and farm
credits has been called to meet at the
Hotel Sherman in Chicago next Mon-
day. There will be several sessions
until the evening of Thursday. This
is the third of the great national con-
ventions called by the Associated
Farm Papers of which the California
Cultivator is a member. Some of the
brightest men of the country are to
be present to make addresses, and we
hope to give of these addresses in
later Cultivators.**THE FARMERS ARE COMING**There have been brought to the
state this year, principally because of
the expositions, several farmers' ex-
cursions by the Santa Fe Railway
Company. These farmers have an-
swered repeatedly and, so far as could
be noted, willingly the universal
"How do you like California?" and
the answers ranged all the way from
"It's great!" to "The best ever, and
some day we will be here to live."Most of these people came to South-
ern California first and were shown
the Panama-California Exposition, the
citrus and other producing sections,
later going through the San Joaquin
Valley where in Fresno and other
places they saw the raisin industry at
its best and how and where figs areproduced, the live stock industry, and
many other features of California
farming and later of course the big
exposition. Nearly all of these farm-
ers were wide awake, successful men.
They were not looking for locations,
but they were impressed with Califor-
nia's way of working. We think there
will be many additions to California's
population because of the things
shown to these farmers.**MARKETING COMMISSIONER**Governor Johnson has ap-
pointed Col. Harris Weinstock as
state marketing commissioner. A bet-
ter appointment could not have been
made. If any one in this state can
take the extremely small appropria-
tion made by the last legislature and
make any showing whatever it is
Harris Weinstock. If success is not
achieved it will not be because of lack
of earnest endeavor or efficiency. A
year's trial under such management
will enable the state to judge some-
thing as to the possibilities and lead,
we believe, to more satisfactory sup-
port by the next legislature. There
are many claiming that there is no
need for such a commission, but we
believe there is no place where the
plea to dispose of products at a living
price is heard so often as in the office
of a farm paper. No mail comes
without the request for information,
"How may I dispose of my product?"
Its production is comparatively easy;
its marketing seems an impossibil-
ity." If Mr. Weinstock does not show
us the royal road, he will at least
formulate some plan which will lead
toward more satisfactory marketing
conditions. We congratulate the gov-
ernor and the people on the appoint-
ment.Edgar A. Forbes, secretary of the
California Development Board, has
been appointed secretary of the state
commission of markets by Mr. Wein-
stock. Mr. Weinstock soon leaves for
the East to investigate as to market-
ing conditions.**PLANT NAVELS**California orchardists have se-
cured a reputation for imitating the
sheep, at least as to following the
leader. If the leader plant pumpkins,
we all plant pumpkins. Then when
the pumpkin market is depressed, we
all with one accord cease to plant
pumpkins. With an annual crop our
mistakes are soon corrected and
usually with such vigor that we rush
into the opposite mistake. With trees
that take years to come into bearing
we should use more reason and less
impulse. A few years ago we were all
planting navel oranges, later Valen-
cias, again Eureka lemons, another
time freestone peaches, then clings for
the canners wished them. On olives
we went to extremes for a short time.
The apricot, in fact, all other Califor-
nia fruits, have followed the same
course. At present we are looking
with disfavor on the orange, the lemon
and some other fruits—this because of
immediate market conditions, without
thought of the years it takes to cor-
rect these conditions.California orange groves, especially
those of the navel varieties, have not
made good the promise of long life
given earlier in the industry. The
seedling was known to live so many
years and bear profitably that it was
assumed the navel would do as well.
Perhaps it will once we learn its cul-
tural requirements, but at present the
growers are guessing as to whether
the navel will bear profitably for 20,
30 or 50 years. But few give it as
long life as 35 or 40 years. If this be
true, within the next ten years great
numbers of navel orange groves will
cease their heavy bearing and must
be replaced by younger and more vig-
orous trees. This will take time. With
the experience of the last quarter cen-
tury there should be fewer planting
mistakes in the next quarter. Prolific
strains only should be selected, the
best of care should be given them, and
above all only locations suited to
orange culture should be planted.An orchardist of wide experience re-
marked in this office only a few days
ago that ten years from today there
would be fewer Washington navel
oranges produced in California than
there are today. We hope he is
wrong, but urge orange growers to
open their eyes to conditions.**Agricultural Notes**Prices of olive oil are advancing in
Syria, particularly because the people
are using it for lighting instead of
petroleum.Chinese cattle are again allowed ad-
mission to the Philippines. For five
years they have been quarantined
against to exclude cattle diseases
prevalent in South Asia.California's onion acreage for 1915
was 8128. This was nearly 2000 less
than the acreage in 1914. The yield
was also more than 900,000 bushels
less. These figures are given out by
the bureau of crop estimates of the
United States department of agricul-
ture.The drouth in Australia has, it is
estimated, resulted in the loss of 30 to
40 per cent of the dairy cattle. Aus-
tralia in consequence will export no
cheese and very little butter. In the
fiscal year 1914-15 Australia exported
domestic butter to the value of
\$12,950,550.There will be a meeting of the
United States Live Stock Sanitary As-
sociation at Chicago, December 1-2.
State and interstate movement of live
stock and quarantine regulations will
be discussed. Particulars regarding
the meeting can be had from Secre-
tary John J. Ferguson, Union Stock
Yards, Chicago.With reference to the English hop
crop it is stated that in many of the
gardens in the counties of Worcester,
Hereford, Surrey, Hampshire, Kent
and Sussex the blight has mastered
the plant, and many of these gardens
will not have a hop picked in them. It
can be safely said that the crop will
not exceed half of that of last year.Russia this year imported \$1,000,-
000 worth of binding twine from this
country. It had to enter Russia
through the far northern port of
Archangel and came too late for most
of the harvest. The Russian wheat
crop is large, but cannot be exported
freely or even brought to ports for
shipment, since the army monopolizes
the railroads.Indiana assessors collect statistics
of silos in the state. This year 20,306
were reported, last year 14,441, and
two years ago 9978. The number re-
ported this year represents one silo
for every 10.8 farms in the state,
which compares with one silo for each
15.1 farms last year, and one silo for
each 21.7 farms two years ago. These
figures reflect the rapid growth of
silage in the United States.The present crops of pears and ap-
ples in Holland are the largest in
years. The orchards are a remarkable
spectacle. It is a literal fact that
pears and apples grow on the trees
nearly as thickly as currants on their
bushes. It would seem that prac-
tically every spring blossom has de-
veloped into a pear or an apple. The
limbs of the trees would break down
under their heavy burdens if they
were not supported by forked poles.
Growers are selling these fruits at less
than an American cent a pound.The department of agriculture has
issued Bulletin No. 315, giving results
of a study of the cantaloupe industry.
It is found that many receivers en-
courage the shipment of greater sup-
plies than they can sell promptly. At
Chicago in one day melons were on
the market from eight different states,
including Delaware and California. In
the study made by the department in
1914 statistics were gathered of 16,401
carloads of cantaloupes. In carload
shipments California was the greater
producer, shipping 5146 carloads.

Agricultural News Notes

of the Pacific Coast

Northern California

An orchardist at Oroville, Butte County, is preparing to plant an acreage to pecan trees.

Yuba City, Sutter County, claims the largest acreage of raisin vineyard controlled by one individual.

Sutter County's output of rice will be greatly increased; one planter is planning for 300 additional acres.

A large sale of rice is reported from Biggs at \$2.00 per 100 pounds. This is considered very satisfactory by the growers.

Some of the "poorest land in Glenn County" has been planted to rice and yielded this year in excess of 30 sacks per acre.

The great poultry show at the Panama-Pacific Exposition has brought together more than 8000 head of poultry.

Fruit growers of Tehama County recently met at Red Bluff and discussed forming an auxiliary to the California Dried Fruit Association.

The Shasta County Citrus Fruit Association has shipped its last car of cured fruit. The season's product aggregated 300 tons, principally prunes.

Butte County's horticultural commissioner, Earle Mills, is urging a more persistent fight against the Johnson grass, which is spreading through many parts of the county.

The upward tendency of the hop market on account of world's shortage is appreciated by all Northern California hop growers. Many growers are still holding last season's crop.

The California Wool Growers' Association recently held its annual meeting at the Hall of Congresses in the exposition grounds at San Francisco. Charles A. Kimble of Hanford is president.

County Horticultural Commissioner Harney of Yuba County is organizing a fight against the pest of yellow scale which has become established in some of the orchards around Marysville.

The butterfat producing contest among the members of the Butte County Cow Testing Association has started. A handsome silver loving cup will be presented to the owner of the cow producing the most butter fat for the 12 months ending October, 1916.

The exhibit of standard bred turkeys at the California state poultry show to be held in Sacramento, January 14 to 18, 1916, will be the largest and best ever brought together, according to the show committee of the Sacramento Poultry Association, under whose auspices the state show will be held.

Five representatives of the various grape interests, the raisin grape growers, the dry wine grape growers, the sweet wine grape growers, the table grape growers, and the growers of grapes of the entire state, will leave for Washington, D. C., at the end of this month to be on hand for the opening of congress next month and to make the fight of the state of California against the 55-cent brandy tax.

Central California

Fresno is shipping butter to Canada.

Stanislaus County is harvesting its heaviest bean crop.

The Travers section of Tulare County has caught the rice planting fever.

Globe, Tulare County, claims the record for earliest oranges shipped this year.

A large attendance was given to the State Fruit Growers' Convention last week in Visalia.

A solid trainload of Porterville beef left that station last Saturday for San Francisco.

Farm Adviser Conner of Stanislaus County is recommending farmers to use bean straw for stock feed.

The severe frost of early November did material damage to gardens and tender plants in many sections of the valley.

Black eye beans are selling at from \$3.00 to \$3.35 per hundred. The farmers are securing approximately \$3.25 for pinks.

Many points in the valley entertained the farmers on the Santa Fe special which passed through the valley last week.

Turlock cantaloupe growers are well satisfied with their receipts this season through their cooperative marketing association.

The great record made by the swine of Mr. Bassett of Hanford will give a great impetus to the swine industry of Kings County.

The citrus crop of Central California is "looking fine" and that section will have a prosperous season on both oranges and lemons.

At an enthusiastic meeting of peach growers at Armona recently liberal subscriptions were made to the new peach growers' association.

The Fresno chamber of commerce has made formal request of the board of regents of the state university to develop the Kearney estate.

The exhibit of tractors at the State Fruit Growers' Convention proved one of the most attractive features.

There were many losses of live stock in Fresno County from blackleg during the month of October. Inspector Longley says that the disease will probably be stamped out as the cold weather comes on.

The Tulare County Protective Association, which last year controlled 98 per cent of the citrus crop of the county, has this year decided to conform to the maturity standard imposed by the federal government.

Kings County dairymen recently received their cream checks for October, prices for A-grade cream running about 29 to 29½ cents and B-grade about 27 cents. Some sweet cream averaged as high as 34 cents.

Preparations are being made all over the valley for a great meeting of peach growers next Saturday in every peach growing section of California at which signatures will be secured for the new million dollar cooperative California Peach Growers' Association.

Southern California

The Orange County Fruit Exchange estimates the new crop at 2070 carloads.

Imperial Valley will hold its first agricultural assembly at Brawley, December 18.

The San Bernardino County Poultry Association will hold its next meeting December 2.

Saticoy, Ventura County, is shipping out from four to six carloads of lima beans per day.

The Anaheim sugar factory finished its run, which was begun in July, on November the 21st.

Four carloads of selected lima bean seed were sent out from Santa Paula last week for sale in Eastern centers.

The La Puente Walnut Growers' Association packing house expects to ship out about 620 tons of walnuts this season.

Orange County's sealer of weights and measures has taken to task produce men from Los Angeles because of short weights.

One Paso Robles almond grower recently hauled a load to market which weighed 6850 pounds, for which he received a check for \$822.

The fall flower show of the Redlands Horticultural and Improvement Society brought out the most wonderful display of chrysanthemums ever made in that city of flowers.

The route between Southern California and the great Central California Valley has been shortened more than 40 miles by the new Tejon Pass cut-off, a part of the state good roads system.

The walnut packing house at Puente, Los Angeles County, recently closed its season with 780 tons, or nearly 80 packed cars of nuts. The walnut market is in exceptionally good condition.

The last meeting of the Riverside County chamber of commerce was held at Elsinore last Friday. Enthusiasm prevailed as to the methods of upbuilding Riverside County and as to the quality of ducks served by the ladies of Elsinore.

The Southern California Arboricultural Convention, recently held in Redlands, decided to hold its meeting at Santa Ana. The new year's officers of the association are: President, C. W. Hickok, Riverside; secretary, W. B. Hadley, Redlands.

Those interested in the movement to locate a cannery in the Chino section of San Bernardino County at a recent meeting elected representatives from the Cucamonga, Collins, Ontario and Chino districts. These representatives will make plans for a permanent organization.

Rialto, San Bernardino County, will soon have one of the finest packing houses in the citrus belt. An orange packing house at Upland has installed a furnace for drying oranges that it is thought will dry the surface of the fresh fruit before shipping so as to give it a much better carrying character.

The Coast

Portland, Oregon, is holding a land products show.

The Oregon agricultural college at Corvallis now boasts a 301-egg hen.

Tombstone cattlemen are disposing of their yearlings on a basis of \$32.

The Weber County farm bureau of Utah has organized a number of new locals.

The Yuma Indians have planned an agricultural fair at Yuma November 25, 26 and 27.

Arizona alfalfa men are appealing to the governor to lift the embargo on Mexican cattle.

The city of Yuma has appointed milk inspectors who will pass on all milk sold in that city.

Finding light demand for alfalfa farmers of the Pecos Valley of New Mexico are buying feeding steers.

About 2000 head of cattle have been shipped from Holbrook, Arizona, to Denver during the past few weeks.

The agricultural college at Corvallis, Oregon, shipped a car load of Shropshire sheep to the Panama-Pacific exposition.

Farmers near Hood River, Oregon, are experimenting with the first crop of cotton yet brought to maturity in that state.

The Arizona state fair held at Phoenix last week brought out an exceptionally fine showing of live stock and general farm products.

Crook County, Oregon, recently held a potato show at Redmond. It was pronounced the best exhibit of potatoes ever shown in the state.

The Oregon Walnut Growers' Association recently met and elected J. C. Cooper of McMinnville, president, and H. V. Meade of Orenco, secretary.

A county farm bureau has just been organized in Beaver County, Utah. This is the second county in Utah to take advantage of its opportunities to secure a farm adviser.

The Western Walnut Association held its first meeting at Portland, Oregon, the first week in November. Growers were in attendance from Oregon, Washington and Idaho.

From 35 to 40 tons of apples at Hood River, Oregon, are now daily being made into vinegar and cider at the local plant. Growers receive six dollars a ton cash for their culls.

Shipments of stock into the Chandler district of Arizona have been delayed by the troubles across the line in Mexico. One stockman reports that 1500 head have just been captured by Villa's army.

The first Satsuma oranges of the season are being sent out from Texas. Satsuma shipments will continue for the next two or three weeks. About 100 cars will be marketed from the state this year.

The Pima Indian fair held at Sacaton, Arizona, the first week in November attracted a big crowd. The agricultural exhibits were not so good as last year's owing to the breaking of irrigation ditches which let the crops dry in the ground.

Warranted to Give Satisfaction.

**Gombault's
Caustic Balsam****Has Imitators But No Competitors.**

A Safe, Speedy and Positive Cure for
Curb, Splint, Sweeney, Capped Hock,
Strained Tendons, Founder, Wind
Puffs, and all lameness from Spavin,
Ringbone and other bony tumors.
Cures all skin diseases or Parasites,
Thrush, Diphtheria. Removes all
Bunches from Horses or Cattle.

Live Stock and Dairy**A WONDERFUL STOCK JUDGING
DEMONSTRATION**

Written for the California Cultivator
By W. S. Guilford

NE of the objects of all fairs
and expositions is education,
and D. O. Lively, chief of
the live stock show at the
Panama-Pacific International
Exposition, planned to make this
world's show the greatest educational
affair of its kind ever held in the
world.

At the close of the judging of the
Berkshire classes Judge F. A. Scott
conducted a judging demonstration,
discussing several of the prize win-
ners in detail and answering many
questions. It was one of the most
valuable lessons in stock judging and
breeding that has ever been delivered
in a show ring in America or any-
where else, and Judge Scott is to be
congratulated not only for his com-
plete knowledge of all the points of
the breed, but for the clear and com-
prehensive manner in which he is
able to convey this information to
his audience.

Grand Leader 2d, the grand cham-
pion Berkshire boar, owned by A. B.
Humphrey of Mayhews was driven in
the ring, and Judge Scott said:

"Beginning at the head of this ani-
mal you will note that he has an ideal
Berkshire head—it is broad, the ears
are upright and the dish is right. I
mean by this that the mouth is set
on a line parallel with the general line
of the body, it is not too dished so
that the mouth sticks up in the air
as has been the case with some Berk-
shires, but is a good, practical mouth
that he can eat with comfortably. He
has a bright, clear, intelligent eye.

"It is a strong, masculine head, in-
dicating his sex in an unmistakable
manner, and it is set on a short, thick,
boar's neck, which blends well into a
shoulder that is a smooth one for a
vigorous boar such as he is. A boar
should not have a shoulder that is too
wide and prominent; it should be even
with the side of the body from end to
end or conform very nearly to this
line, but a boar's shield was put there
by nature for protection, and genera-
tions of breeding have not entirely
done away with it. I like to see a
shield drop away straight from the
top line and not bulge out too much.
When a shield springs out too widely
it is too prominent and the animal is
apt to be too coarse. The shoulder
must be smooth and wide on top.
This hog has a good shoulder.

"Right back of the shoulder is what
is known as the heart girth, around
that part of the anatomy in which
the heart and lungs are found, and
here Grand Leader 2d is exceptionally
strong. This is a point that all
breeders of pure bred animals must
give particular attention because it
will be noted that a large percent of
all animals are somewhat slack in this
point.

"The bottom of the chest should be
broad so that the legs set squarely
under the 'corners' of the animal.

"I want to call particular attention
to the heavy bone of good quality that
this boar has, and to his pasterns and
feet. He is right up on his toes and
carries his weight easily. A great
many hogs have weak pasterns.

"This hog has a wide back and loin,
the ribs are widely sprung and there
is a thick even covering of flesh. The
back is nicely arched with no ten-
dency to sagging or weakness and he
has a straight bottom line.

"The rump is wide and carries
evenly out to the tail, and the tail is
well set up. Some Berkshires have a
drooping rump, making the strength
of this animal in this point especially
to be commended.

"He has a full, deep, well rounded
ham and it is carried well down to
the hock. His testicles are set at the
right place—I do not like to see them
too high—that conformation does not
generally accompany a deep ham—

neither do I want them to hang too
low.

"The hind legs are set squarely
under the body and, like his front
ones, are strong. His rear pasterns
are upright as they should be.

"There are three measurements of
a hog that are just about equal on an
ideal animal; the length of the top
line from between the ears to the root
of the tail; the measurement around
the heart girth, just behind the
shoulders, and the measurement
around the body at the loin and rear
flank."

A rope was produced and it was
found that the measurement of the
heart girth was about five inches
greater than the length of the top
line, and the rear girth about three
inches greater than the top line
length, showing a remarkable and
unusual strength of heart girth. Con-
tinuing, Judge Scott said:

"These are very satisfactory mea-
surements. Frequently the length of
the body is much greater than the
girth measurements. A compact boar
like this makes a good 'nick' with
long-bodied, roomy sows.

"This is a very symmetrical animal
and I consider him one of the great
boars of the breed."

Following this a number of the
pigs sired by Grand Leader 2d were
driven in the ring. He sired the two
pens of four sons each that were
placed first and second in the "get of
sire" class; the junior and reserve
grand champion boar Star Leader
bought by the University of Califor-
nia; and the great boar pig Grand
Leader 6th, owned by Butte City
ranch and considered by many good
judges to be one of the most promis-
ing young animals in America.

"The real test of any breeding boar
is the kind of offspring he produces,"
said Judge Scott, "and here are a lot
of animals that are superior individu-
als, as 'like as peas' and a wonderful
demonstration of the ability of a
great individual to reproduce himself.
There are many boars that have the
good points themselves that are not
able to transmit them—so that he has
two claims to fame: superiority as an
individual and remarkable ability as
a breeder."

Over 100 interested people attended
the demonstration, but the amphithe-
ater should have been packed.

**THE WESTERN BERKSHIRE
CONGRESS**

Written for the California Cultivator
By W. S. Guilford

After the banquet given by the
American Berkshire Association to
breeders of Berkshires and others in-
terested in the improvement of hogs
at the Inside Inn on the Panama-Pa-
cific International Exposition grounds
November 5, 1915, the "Western
Berkshire Congress" was organized.

This is one of the most important
things that has ever happened in live
stock circles in the West.

The Western Berkshire Congress
will work with the American Berk-
shire Congress and the American
Berkshire Association, but will have
for its object the upbuilding of the
Berkshire business in the West.

The American Berkshire Congress
through its meetings and sales has
been the means of bringing breeders
closer together, harmonizing interests,
educating breeders and hog men as
to the best sort of hog and the best
to be attained in Berkshire perfection,
and generally advancing the Berk-
shire business in a very remarkable
way in the Middle West, the East and
the South.

The American Berkshire Congress
was started as a "get-together" affair
by a half dozen breeders who were
visiting N. H. Gentry at Sedalia, Mis-
souri, and who realized that by meet-
ing with each other and exchanging
ideas much good would result. Now
the annual meeting is a big affair with
a program made up of addresses and

**A Jump in Her Record**

Most every herd has one or more cows
that seem sluggish and low in yield
without any apparent reason. In many
cases this may be due to some vital or-
gan becoming overworked. Proper treat-
ment is needed to build up the system
and fortify the cow against serious
disease.

If you have such a cow, buy a pack-
age of Kow-Kure from your feed dealer
or druggist and use according to direc-
tions. You'll be surprised at the differ-
ence it makes in her general health and
milk yield. Kow-Kure is especially
recommended as a preventive and cure
for Abortion, Barrenness, Milk Fever,
Scouring, Lost Appetite, Bunches and
other common ailments.

discussions on subjects of vital interest to the breed and industry, a banquet, a big show of Berkshires at which the best of the breed compete for prizes, and a sale.

The congress has a set of officers separate from the American Berkshire Association which handles the registry of the animals of the breed, but the congress is given all possible support and encouragement by the record association.

Because of the great distance between the Middle West and the states of the Pacific Coast and intermountain region, it was agreed by those officers of the American congress, and the registry association who were present at the banquet and meeting at the Inside Inn that the best interests of the breed and of the breeders in the West would be served by a separate organization out here. They pledged all manner of hearty cooperation and such financial support as could be given.

Unquestionably the best man in the West was chosen for president of the Western Berkshire Congress, J. J. Thatcher of Thatcher, Ennis & Williamson, Riverside. Mr. Thatcher has been president of the American congress and has been prominently identified with the affairs of the breed for a number of years. He is full of energy and enthusiasm and "knows how."

C. M. Talmage, Newport, Washington, a prominent and progressive breeder of the Northwest, was made vice-president, and F. R. Steel, of Grants Pass, Oregon, another "live wire" was made secretary-treasurer.

The members of the board of directors were appointed by the president and are: W. M. Carruthers, San Francisco; A. B. Humphreys, Mayhews; S. B. Wright, Santa Rosa; Jos. Wilson Jr., Mason, Nevada, and J. M. McCain, of Utah.

Nearly 100 breeders have already joined the congress and everyone breeding Berkshires or interested in the breed should get in touch with some of the officers and find out what can be done to help along the good cause.

There is room for more good Berkshires everywhere in the West and a great service is accomplished for agriculture and in the best interests of the whole community whenever anything is done to bring about this result.

THE CALIFORNIA SWINE BREEDERS' CONSIGNMENT SALE

Written for the California Cultivator
By W. S. Guilford

The breeders of pure bred swine in California owe it to themselves and to the business to make the consignment sale of the California Swine Breeders' Association, to be held in Sacramento January 27, 1916, the big success that it deserves to be.

Every breeder who is not now a member of this organization should send the membership fee of \$1 at once to Secretary J. I. Thompson, Davis.

The sale is to be preceded on January 26 by a big meeting during the day and a banquet at night, and it should be an event of great importance to the whole industry.

Sacramento promises to become a great purebred live stock sale center; one of the best sales of the Holstein breed was held there recently and more are scheduled.

Live stock authorities from the Middle West who were in attendance at the Panama-Pacific International Exposition shows were most emphatic in their statements to the effect that there is no better way to bring about general distribution of registered animals than through well advertised public sales. These statements are based on many years of experience, and we can certainly do no better than to profit by it.

Instances are cited where men have been breeding registered animals in a community for years with practically no local demand for their stock, but when animals are sold at auction either at home or in a consignment sale elsewhere their neighbors frequently become good buyers. It is difficult to explain why this should be so; it just "happens" that way.

It is very important that none but

good animals be consigned to public sales. Even if there is a demand such that inferior animals will sell, the breeder who offers them does himself a great injustice in so doing, as well as working an injury to the breed and to the industry.

DAIRY FARMING IN SAN BENITO COUNTY TAKES ANOTHER STEP FORWARD

Written for California Cultivator
By J. H. Jacobsen, Dairy Barn Expert

In San Benito County is to be found one of our most progressive farmers. Developing his 1900 acres of rich soil with intent of avoiding any waste, making every particle of crop enhance the treasury, we find Mr. J. Lansing Lane of Hudner erecting a model sanitary dairy barn for his herd of 60 fine Holsteins, all heavy producers.

In deciding just what was needed for the comforts of his herd, Mr. Lane had his plans carefully reviewed by a dairy barn expert. Every feature that would tend to benefit the cow, furnish perfect sanitation and ventilation and lessen the labors of employes has therefore been incorporated in the plans and specifications. Aside from this building, Mr. Lane has already built a large storage barn and five silos to care for the large crop of sorghum or corn specially grown for his use on the farm. He believes that the best treatment of the herd is none too good for the animal upon whom he depends for pure milk rich in butter fats.

Inasmuch as the sanitary arrangement and condition of barn play an important part in combating the development of bacteria in the milk, a description of this barn will be of interest.

The building is 125 feet long by 40 feet wide, with peaked roof and a height of 19 feet. Along the peak are located five ventilators, 20 feet long.

Concrete foundation walls extend up five feet from the ground line and are finished smooth with cement plaster. Both sides of this barn, just under the eaves, are open and screened, thus insuring perfect ventilation and protection from flies. With cement stall floors, back of which are gutters, a more cleanly condition could not exist, for the building will be washed down after every milking, even the cow will receive her bath upon entering her place in the barn. Feeding mangers of smooth concrete have also been provided and are so constructed that they can be cleaned and washed after each feeding. Every comfort for the cow while feeding has been provided. Sanitary tubular steel stalls with flexible tubular stanchions are being installed, also an overhead trackage system for handling feed from silos to mangers and removal of litter from barn.

Mr. Lane is to be complimented as a student of scientific methods in agriculture for his efforts to produce pure milk under the most sanitary conditions which insure to consumers of his product a rich milk and the very best butter obtainable.

ERGOT

Ergot is a name applied to one stage of a fungus that works in the heads of a number of grasses. It causes one of the oldest known stock diseases, the so-called "ergotism."

Ergot is abundant in some localities at this season. It forms purple-black, straight or horn-like, hard structures about one-fourth to one-half inch long. These structures occupy the position of the grain in the head of grass. This hard mass is not a degenerate kernel of grass, however. The black ergot masses vary in size and shape, depending upon the plant attached. They are largest in rye. Ergot develops upon a number of grasses, chief of which are cultivated rye, wild rye, wheat-grass, meadow-grass, timothy and red-top.

There is no effective remedy for ergotism. Hence, one should become familiar with the appearance of ergot, and avoid grazing stock on badly infested areas and also avoid cutting infested areas of grasses for hay.—W. W. Robbins, Colorado Agricultural College, Fort Collins, Colorado.

Sows Not Breeding

On my ranch I have 25 old sows and 60 others about 15 months old. None of them are breeding to suit me. All of the young sows should have had pigs by the time they were one year old, but now only 12 have farrowed and only about half of the rest are with pig. What is the trouble? We have four boars large enough for service which we give turns of a week or ten days each running with the sows. All are in fine condition, having been fed grain and alfalfa until two months ago when we cut out the grain, but with no apparent results. The hogs are pure bred Duroc with some registered Mulefoot ones for trial. Please state what can be done to increase the number of pigs.—Subscriber, Arizona.

We do not think that hogs are as prolific here in this arid country as they are in the East where they get more corn, also that you are not handling your boars right. With so many sows you should not turn the boar in

and let him exhaust himself on two or three sows, but only let him serve each sow once or twice and then separate them, only letting each boar have one or two sows a day. The boars should be kept in small pastures by themselves and the sows taken to them for only a short time, one each morning and evening. When the sows come in heat they should be separated from the rest and turned into a separate lot. Then after four or five days when the swelling about the vulva is about gone let the boar serve them once or twice and turn them back with the rest. In that way if there are several to be served in one day they can be divided between the boars. This will require some extra care but the increase will probably be worth the time spent. A little tincture of iron or sulphate of iron in the feed would also help matters some. Of the tincture of iron give an ounce to every ten hogs and repeat it every few days for a month. Or if you prefer the sulphate of iron give an ounce of the powder the same as that amount of the tincture.

Disinfecting Bull

Please give directions for disinfecting a bull after having bred cows affected with contagious abortion.—Subscriber, San Diego.

Clip off the hair from the belly and especially the long hair about the sheath, then wash the parts clipped with warm water and zenoleum, a pint of the zenoleum to a bucket of water. Also inject into the sheath with a continuous-flow syringe a solution of bichloride of mercury; one to the thousand. You can get the antiseptic tablets of your druggist and they are made so that one in a pint of water makes the right strength. You should use at least a gallon of the solution in washing out the sheath. The work should be done thoroughly, and to make sure of reaching all infection it should be repeated two or three times, a day or two apart. At the same time clean out the litter from the bull's stall and disinfect that with the zenoleum solution.

Caked Udder

I have had several cows with caked udders, the swelling lasting for a day or longer and then going away. Have been unable to ascertain any cause for it. Could it be an epidemic?—Subscriber, San Diego.

Probably due to an overloaded system. Use the old remedy that is recommended by all, a pound of epsom salts and a half pound of common salt dissolved in two quarts of hot water and when cool give at one dose as a drench. Or mix twice the amount of the above remedies for each cow and give a handful in the feed once a day while it lasts.

Milk Fever

About a month ago my cow came fresh. Within three hours she went

Poultry for Profit

THE PANAMA-PACIFIC POULTRY SHOW

Written for California Cultivator
By M. C. Holman

ALL of the live stock exhibits at the exposition have brought together a very select showing of high bred animals and have instilled

into the minds of Californians the importance of raising something on the farm that will eat the produce and return goodly profit to the owner. It is better to drive or crate the produce to market in the shape of flesh, be it pork, mutton, beef or poultry, than to sack it up and sell it for little more than its costs to produce.

It is no new thing to say that California should produce more poultry. With the resources of this great state at the service of the poultryman there is no reason why much more land cannot be given to poultry and still add large sections for the raising of other live stock. We import thousands of pounds of poultry and thousands of dozens of eggs, all of which could be raised in California. Instead of importing we should export poultry and eggs. We should send them to the frozen East and the time is probably not far distant when we will be able to reverse the shipping instructions.

It is shows like that given at the exposition which stir up the ambition of poultrymen to raise better poultry and more of it. The cream of all the country far and near found their wire cages waiting them and there was no difficulty in placing the birds in their proper berths. So complete had been the arrangements that each exhibitor knew exactly where his birds were to show. We mention this feature as illustrating the part that system plays in every poultry movement, whether it be for the back yard raiser of a single dozen or the commercial man who specializes on quantity. It is all the same. Without system there is a loss entailed; with system there is the saving that makes the profits.

The exposition poultry show was the largest ever held on the coast and one of the largest in the world. We do not remember anything to equal it either in the number of birds or the quality displayed. In order to give our readers some idea of the magnitude of the undertaking let us present a few statistics. In all there were 7725 birds divided as follows: Single, in pens, 3252; two or more in pens, 1550; in display pens, but not for prizes, 276; bantams, 345; pigeons, 1618; turkeys, 168; geese, 90; ducks, 226; game farm exhibit, 200.

As one of the judges remarked "This show will stand for a long time without a rival either in size or quality". It is an unquestioned delight to look upon the pick of poultrydom, and at that show one could do it to his utmost satisfaction, for the cream of the East was cast with the cream of the West into the melting pot of critical examination and the best bird won, regardless of his nativity.

To judge this great collection of feathered blue blood required the services of 26 students of the Standard of Perfection. Five were from

California, two from Canada and the others from the Eastern states. And they were well occupied for the task required the action of gray matter to a greater extent than is usual in the ordinary poultry show. The birds had been selected by men who knew something of points, and the judges were merely to select from the selected.

The various breeds were particularly well represented and by almost standard models. The Plymouth Rocks alone numbered 525 pens, more than the entire number in some of our largest shows on the coast. Of course there was the regular showing of Barred Rocks, White Rocks, Buff Rocks, Silver Penciled, Partridge and Columbia Rocks. But there was also the Pyle Plymouth Rocks. These birds have brown markings on the back, with the lower part of the body a grayish white. The Blue Plymouth Rocks are solid blue in the hens, while the cock birds have a black coat on their backs over a solid blue.

The Wyandotte class was represented by 306 pens. Included in these were the Silver, Golden, White, Buff, Black, Partridge, Silver Penciled, Columbian, Blue and Spangled. The latter two are rather rare and very seldom shown outside of private exhibitions. The Wyandotte is unquestionably a classy bird and should become extremely popular. With a good carriage, firm body and good laying qualities it is one of the standard utility birds.

The Rhode Island Whites and Reds occupied 328 pens. This showing brought out the strongest type of this bird we have ever seen and the contest for prizes was particularly keen. The Rhode Islander, whether white or red, is not to be denied his full share of popularity, for it is a sturdy bird, of good proportions and a heavy layer.

The Light and Dark Brahmas required 106 pens. This is an unusually large number for this heavy type and our former shows have been satisfied to present a dozen pens of this breed.

To give our readers an idea of the magnitude of this exhibit we present herewith a list of the entries with the number of pens of each one. You can form your own opinions as to the quality of the birds that finally showed up as winners in this great array.

Cochins, 22 pens; Black and White Langshans, 66 pens; Minorcas, 183 pens; Leghorns, 462 pens; Black Minorcas, 13 pens; White Faced Black Spanish, 34 pens; Blue Adalusians, 44 pens; Single Comb Anconas, 76 pens, Orpingtons, 370 pens; Cornish, 75 pens; Campines, 117 pens; and a great number of miscellaneous breeds.

A special feature of this show was the great number of rare breeds, the kind not often seen in shows and particularly in the West. A few names will give an idea of the varieties: Bearded Golden Polish, non-bearded Silver Polish, La Fleche, Crevecoeur, Salmon Faverole, Sultan, Frizzle, Black Rhineland, Missouri White Fluff. There were many other rare breeds, but this list will suffice to give an idea of variety. Many of the specials are well enough for the fancier, but they have no place in the practical poultry yard.

List of awards not received in time because of going to press on account of the Thanksgiving holiday. It will be given next week.

20 Shorthorn Bulls

All registered and tuberculin tested. Age 10 to 36 months old. Every one a splendid individual, carrying the blood of such noted sires as White Hall Sultan 163573, Gladstone 239313, Royal Cumberland 316722. Correspondence solicited, inspection invited.

"SPEEDING UP" THE PULLETS

Written for California Cultivator
By Jean A. Koethen

GILROY subscriber sends us a clipping from an Eastern paper with this request: "Would like to have your opinion in regard to that item. I always thought that pullets ought to have plenty of litter to scratch in and plenty of green."

The clipping reads: "Speed up the pullets that are not getting red in the face and showing proper comb growth. A wet mash is recommended for this purpose, fed early in the morning, all they will clean up in 20 minutes. Another good plan is to cut out all grain except a little at night, keeping them constantly at the feed hoppers of dry mash all day. Shorten the range and do not overfeed green stuff."

I have no idea what paper this came from nor who was the writer, but I venture to say that whoever wrote it wrote without duly considering just what is involved in that expression, "speed up." "Speeding up" usually means making up for lost time, whether the speeder be a horse, an automobile or a chicken, or at least getting ahead of the calendar. It can be done, in the case of a horse or an automobile, though at the expense of some strain which will be paid for later. In the case of a pullet, it might perhaps be possible to get eggs a little sooner by some such forcing method—I am not at all sure that it is even possible, but we will assume for the sake of argument that it is—but it would certainly be at the sacrifice of the future usefulness of the pullet.

If the pullet were merely an egg machine, it might be possible by pouring a little more egg material into her to produce a finished product, but she is not a machine. She is a living, moving creature, and it is absolutely essential that she reach maturity before she begins to lay. Egg laying is reproduction, and a hen is not fit for reproduction till she is mature. The reddening of the face and growing of the comb are accompanied by the development of the egg organs, and delay in showing these outward signs of maturity merely indicates that there has been a check somewhere in the growth of the bird. It may have been because of chilly, wet weather, or on account of fright or from frequent moving from coop to coop or lack of sufficient and suitable food, but there has been some sort of check, and trying to speed up at the last by feeding forcing mash is futile.

Laying should not begin till growth ceases. Robinson says: "Normally, laying begins at maturity, but occasionally immature birds, especially of the smaller and more precocious breeds, produce a few small eggs. The premature activity of the reproductive organs almost invariably results in stunted growth and the postponement of the beginning of mature, regular laying. Premature laying, though of no advantage, is often considered by the poultry keeper an indication of reproductive vigor and future heavy laying, and so gives him little concern; retarded laying is a matter for serious consideration."

The causes of retarded laying, Mr. Robinson explicitly avers, do not include lack of proper food, for there must be activity of the reproductive organs before the food can be turned into eggs. "A common fallacy, now generally discarded by students of the subject, makes activity of the reproductive organs dependent for its beginning as well as for continuance upon a surplus of food of proper composition. That this view is erroneous is evident when, with opportunity to eat all that they wish, hens that are not laying eat lightly and keep fat on a light ration, and when, as the hens begin to lay, the amount of food consumed is greatly increased."

Before she can produce eggs a pullet must be provided with all the food she needs for the maintenance of her bodily strength and heat. When she has had all this, and is vigorous and comfortable, she must still have a sufficient surplus of nourishment to provide material for eggs. What will she do if she is provided with merely egg-material and left without provision for her own maintenance? Wouldn't that be like trying to run a factory without providing for the wages of the workers or for the

mechanical power to keep the wheels moving?

This is precisely what the above clipping suggests. Give the pullet the dry mash that provides egg materials, though her undeveloped comb indicates that she has as yet no power to

Sacramento, California State Poultry Association, Jan. 14-18, 1916, C. A. Wilkins, P. O. Box 1117, Sacramento, secretary.

make eggs, and keep from her the good hard grain and greens that she needs for maintaining health. Would not that be shortsighted?

The first principle of pullet growing is that the pullet shall not be required or even permitted to lay till she is fully grown. The second is that she be kept growing without the slightest check from shell to laying house. A single day's illness, lack of exercise, neglect, annoyance by insect pests, overcrowding, lack of a properly balanced ration, may, any one of them, retard laying maturity for a month or more. If you want to "speed up" you must do it from the beginning.

After the pullet shows by her comb and her size that she is ready to lay, she may be assisted in several ways. The hot morning mash, savory with vegetables, with tempting bits of green sticking out, is one of the best. A little chopped chili pepper in this occasionally does no harm, but the ration must not be too stimulating. Mustard and mustard flour are also recommended, but like the pepper they must not be overdone. A mash moistened with clabbered milk is one of the best egg foods and is fed regularly in the afternoon at the Missouri laying contests. There is nothing better than a good feed of green cut bone twice a week if it can be had fresh. Any of these things, after she is ready to lay, will help her to begin, but she must be ready first. That is the important thing.

What shall be the regular ration of the pullet that is kept for egg production? The United States department of agriculture has been undertaking a series of experiments to determine just what feeds fowls prefer and how much of each kind of feed they eat when they are supplied with a variety, and has concluded that "Hens should be permitted to balance their diet themselves. If given equal quantities of various feeds they wisely will select their rations according to the

formula: Corn meal, 63 per cent; beef scrap, 20 per cent; bran and middlings, 17 per cent."

A good many expert poultrymen are coming to agree with this decision of the department, but they also agree that it is not easy or usually practicable to keep all needed kinds of feed before the hens in hoppers. It is not difficult, however, to keep oyster shell and beef scrap in hoppers by themselves, letting the birds help themselves as they will, and to mix the bran, middlings, cornmeal and other ingredients in a mash from which they will pick what they may. Whole grain should be at least half the ration at the start but the proportion of dry mash may be increased as the pullets settle down for the winter's work.

BREEDING FROM GOOD LAYERS

Half an egg a day is the average to which every industrious and self-respecting hen ought to attain, according to the University of California. Trap nests are the means recommended for hastening the coming of the golden age when the "boarder hen" shall be exterminated and every hen shall average at least 180 eggs per annum.

This homemade trap nest closes when a hen enters to lay an egg. Thus accurate record can be kept of the production of individual hens. Hence the poultry raiser can incubate only eggs from hens with a high record as egg producers, mated with well grown, sturdy roosters whose mothers were naturally prolific layers. The result of such selection on sound eugenic principles is rapid improvement of the natural laying capacity of the flock. The trap nest makes it easy also to discover and eliminate the hen which does not earn her own keep.

How every poultry grower may cheaply and easily with his own hammer and saw make trap nests for his poultry yards is told by J. E. Dougherty and W. E. Lloyd at the university farm, in a publication on "Practical and Inexpensive Poultry Appliances" just issued, obtainable free by writing to the college of agriculture at Berkeley.

Other useful home made poultry devices are described also, such as dry mash hoppers which will prevent waste of chicken feed, self feeding grit or shell hoppers, mash hoppers especially for chicks, catching coops for transferring large numbers of chickens from pen to pen, devices to be used in killing and dry picking fowls, crates in which birds are fattened for the market, supply cans to be filled once a week, to save labor at recurring feedings and to aid in keeping records of the feed consumption per pen or per flock; a cabinet in which 2000 eggs (being saved for the incubator) can be turned daily simply by revolving the table on its axle, devices for marketing eggs and chickens in working toward improvement of the heredity of the flock, and an electric candler for candling market eggs or testing hatching eggs during incubation.

A gallant Tommy, having received from England an anonymous gift of socks, entered them at once, for he was about to undertake a heavy march. He was soon prey to the most excruciating agony, and when, a mere cripple, he drew off his footgear at the end of a terrible day, he discovered inside the toe of the sock what had once been a piece of stiff writing

paper, now reduced to pulp, and on it appeared in bold, feminine hand the almost illegible benediction: "God bless the wearer of this pair of socks!"—Punch.

 ples, Etc., Free. Spencer Apiaries, Ven-
 tura, Cal.

LIVE STOCK

Big Type Poland Chinas—I have an extra
 good lot of strictly high class young
 boars from three months to one year old
 that are fit to head any herd anywhere.
 Visitors say they are the best they have
 seen. They have the large size, the good
 hams and shoulders, the strong arched
 backs, great length and depth of body,
 plenty of smoothness, mellowness and
 quality—in fact, they have two good ends
 and a good middle, are good lookers and
 money makers. Their dams are either
 from Illinois, Iowa or Missouri, or they
 are from dams whose sire or dam are
 from these states. These boars are sired
 by Iowa Wonder who will weigh over
 1000 pounds in show condition. He is a
 son of A WONDER, the greatest Poland
 China boar living or dead. These young
 boars carry the stamp of their sire and
 will sire pigs that will please you. Satis-
 faction guaranteed in every particular. I
 am overstocked. I have boars galore. I
 will sell them at extremely low bargain
 prices. No females for sale at present.
 The book on "THE HOG SUPREME—
 THE POLAND CHINA" will be sent to
 you free for the asking.

Yours for the BIG TYPE—the kind that
 grow faster and larger and have more
 pigs. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I.
 C. Swine; the big white kind. Ready
 for immediate shipment; weaned pigs of
 both sexes; pairs and trios; mated not
 akin. All these pigs are from big type
 stock, of extra heavy bone; weight, with
 early maturing quality. Immunized
 against hog cholera; crated and registered
 free. Write for descriptive circular and
 price list. C. B. Cunningham, Mills, Sac-
 ramento County, California.

For Sale—Duroc Jersey Gilts; the dams
 of these gilts were sired by such noted
 boars as Nebraska Sensation, Cal. Chief,
 Top Notch King. He by Modesto King
 and bred to Bakersfield Jack and Fanc-
 y Colonel. He by Defender Perfection. He
 by Defender. Defender weighed 1100 lbs.
 Sold for \$5000, and has more high priced
 stock to his credit than any Duroc boar
 in the U. S. John Kincaid, East Bakers-
 field, Cal.

Fine Registered Percheron Stallion from
 the very finest imported prize winning
 stock in California. Color, dapple coal
 black with star; 22 months old; weight
 1500 lbs.; height 16 hands. Very gentle,
 broke, sound and perfect. Will make one
 of the best stallions in the country. Will
 sell cheap. Make offer. P. E. Swanson,
 112 Howard St., Glendale, Cal.

Registered Poland Chinas—Large type.
 Dam sired by 1000-lb. Grand Champion
 Idaho; service boars, open or bred gilts
 and young stock, sired by son 1st prize
 winner Wisconsin 1914 and Grand
 Champion P. P. I. E. 1915 Exposition.
 Prices reasonable. Satisfaction guaran-
 teed. A. J. Robinson, Route A, Box 275,
 Modesto, Cal.

Del Dayo Farm (Old Haggin Bottom
 Ranch) Registered Berkshires, both
 sexes and from weanlings to one year
 old. Now ready a few choice Gilts safe
 in pig and some very choice 10 mos. old
 Boars and every sale absolutely guaran-
 teed satisfaction. Stephen S. Day, Sac-
 ramento, Cal.

Grape Wild Farm Thoroughbreds—Guern-
 sey Bulls of A. R. Breeding, BERK-
 SHIRE HOGS. Finest herd in the state.
 All ages for sale. A. B. Humphrey, pro-
 prietor, Mayhews, Sacramento Co., Cali-
 fornia.

65 Head Registered Poland China Hogs
 for sale; all sizes, both sexes. None bet-
 ter anywhere. Large and medium type.
 \$20.00 and up. We will please you or re-
 fund your money. W. A. Young, Lodi,
 Cal.

Blue Ribbon Herd Duroc-Jersey Hogs,
 service Boars and Bred Gilts a special-
 ty; also boar and two sows, not related.
 Meet me in S. F., 1915, prices. John P.
 Daggs, Modesto, California.

 for hatching now ready. Some birds
 for sale reasonable. Hillside Ranch,
 R. F. D. 11, Box 579, Los Angeles.

VETERINARY QUERIES

Continued from Page 520

down with milk fever. She was
 treated by a veterinarian and was up
 again in about eight hours. He also
 removed the afterbirth. The milk is
 bloody, dark and thick. The milk is
 ropy and sometimes the cream is pink.
 The cow eats well and seems hearty
 but gives only about half the milk she
 should. Will she come back to the
 regular flow of milk and what can be
 done to correct the blood in it?—
 What is the cause of it?—Subscriber,
 Fowler.

Probably a part of the afterbirth
 still remains and the poison from it
 is causing the trouble. Better call
 back the veterinarian and have him
 wash out the womb with several
 buckets of warm water with some
 creolin or carbolic acid in it. Be sure
 to reach the farthest extremity. Also
 give the cow a pint of raw linseed oil
 with an ounce of turpentine in it once
 a day for three or four days. The tur-
 pentine will act as an internal anti-
 septic and help to stop the poison.

Tongue Loller

I have a large, six-year-old mare that
 got some barley beards under her
 tongue about two months ago. I re-
 moved the beards but the mare at
 once formed the habit of carrying her
 tongue out on one side all the time
 that the bridle is on. Can you suggest
 a remedy or cure?—Subscriber, Fall-
 brook.

This is known as tongue lolling by
 horsemen. Some owners drive such a
 horse without the bit, only attaching
 the lines to the rings of the halter.
 Some buckle a strap tight around the
 nose and under the chin about where
 the rings of the bit come, passing it
 through the side pieces of the bridle.
 Probably the best remedy is a bit
 made for that purpose. It has a flat
 plate two inches wide by three or four
 inches long attached to the middle of
 the bit so it is free to turn, the longer
 dimension of the plate being length-
 wise of the tongue. This will nearly
 always stop it. The bit is on the mar-
 ket and can be obtained of a harness
 maker.

Abortion

Please tell me what is wrong with
 my cow and what I can do to over-
 come the trouble. She was fresh last
 January without any trouble. Since
 then she has been giving as much as
 ten quarts of milk a day. She was
 bred May 6 but lost her calf about
 three weeks ago. She is now giving
 nearly six quarts of milk a day, but
 after the milk stands a day it gets
 stringy. The stringiness seems to dis-
 appear when the milk is sour. Am
 feeding baled alfalfa hay and beet
 pulp. What can I do to overcome this
 condition of the milk? Will she con-
 tinue to give as much milk or will she
 decrease and then increase again at
 the time she was due to be fresh? Will
 it be all right to breed her again in
 January?—Subscriber, Upland.

It would be impossible to tell what
 caused the abortion. From present
 conditions it seems that the dead
 foetus has poisoned the system by
 absorption, not enough to cause death
 or severe illness but enough to change
 the condition of the blood and affect
 the milk as you describe. Would ad-
 vise giving a physic of aloin, one
 ounce; turpentine, four ounces and
 raw linseed oil, two quarts. Mix,
 shake and divide into four doses and
 give one dose every day. Follow by
 giving a handful of epsom salts and
 common salt, equal parts, once a day
 for a week. She will probably con-
 tinue to give about the same amount
 of milk as now unless the feed be
 changed or increased. It will be all
 right to breed her again when she is
 in season.

The Household Department

W'EN LOVE LIGHTS DE FIAH

Raindrops tappin' at de windahs,
North win' blusterin' 'gainst de doah,
Seems lak' summer's done gone lef' us
An' ain't comin' back no moah.
Flames roarin' bright up de chim'ley,
Shaddahs playin' chase on de wall,
For w'en love builds de fiah in de cabin
Wintah can't come nigh at all.

Pickaninnies playin' in de cohnah,
Laughin' w'en de blas' knocks de doah,
Li'l faces, shinin' in de lamplight
Dat falls 'cross de ole cabin floah.
Mammy bus'lin' roun' a-singin' sof'ly
Daddy res'in' in de light an' cheer,
W'en love lights de fiah in de cabin
Nevah feel dat wintah's neah.

W'en life's stohms am fierces' roun' us
blowin'
An' de rain's come to de doah an'
knocked.

W'en de clouds shet out de light ob
noonday.
Den's de time to keep de doah tight
locked.

Long as we'ah togeddah le's be happy,
De win' may blow—le's laff along de
way,

W'en love lights de fiah in de cabin
Life's jes' lak a sweet summer day.

Helen P. Metzger.

SCHOOL LUNCHES

SPLENDID articles have come to the household department this month in response to the request for suggestions as to school children's lunches. As so often happens we are unable to find room for nearly all of them. This month we need at least a dozen pages in this department. The articles that do appear we know all readers will find exceptionally helpful and suggestive. Other articles will be used in later issues.

Prize Winners

To Charlotte M. Hoak has been given first prize this month; to Miss A. Butcher, second.

DECEMBER CONTEST

For the December contest give us your solution of the Christmas gift problem. It is a big problem to most of us, particularly this year. How will you solve it?

Prize Offers

For the best article, \$2.00 in cash; for second best, \$1.00. All articles published will entitle writer to three months' extension of subscription to the California Cultivator unless such extension has already been given this year. When writing send name of member of your family who now receives the paper so that the extension may be properly credited. Or, of course, a new subscription may be started. Please write on one side of paper only. Communications should be in this office by Thursday morning, December 8, and they will appear in the issue of December 16. Send them in as early as is convenient.

SCHOOL LUNCHES

The literature of dietetics offers much on the feeding of infants and adults, but surprisingly little that is really available to the average mother on feeding children of the school age. In the preparation of school lunches three very important points must be kept in view: 1. They must furnish the necessary material for up-building the body; 2, they must furn-

ish energy for play; 3, they must give clearness of brain for study.

"Balanced diet" is the slogan of the hygienist today, and complex and baffling tables of the fat, proteid, and starch contents of the various foods are offered. Often they are profitless to those not versed in technical terms. After all, a few common sense rules will serve the average mother of the typical healthy child. 1. Never include more than one sweet in a lunch; for instance, if you put in cake do not include jelly sandwiches. Stuffed dates, pressed figs, raisins and sweet chocolate may be used instead of cake or a little home made candy may be added. 2. If you put in hard-boiled or stuffed eggs, accompany them by plain bread and butter or lettuce sandwiches. Meat would be unnecessary as the eggs supply the hearty food. 3. It is wise to avoid the time honored pickle as it contains almost no nourishment and may interfere seriously with the proper digestion of the other food. Use ripe olives instead. 4. Always supply fresh, ripe fruit if possible. 5. Remember that ham, pork and veal require several hours for assimilation and use them sparingly; for taken all in all the meal should satisfy hunger, replenish the body's wastes, but never burden the digestive organs.

Lunches should be neatly and attractively packed. Oiled paper should be used to wrap each separate bit of food so that each food retains its own flavor. Paper containers cost very little and may be utilized to hold custards, puddings, salads, cooked fruits, etc. They are made with covers that fit securely and come in all sizes from one-eighth of a pint to one quart. Puddings and custards may be baked in them and fruit, gelatines and blanc manges may be poured into them while still warm. Each lunch box should contain a collapsible aluminum cup. A small thermos bottle is invaluable for cold or rainy days.

On account of their compactness sandwiches will always form the backbone of the lunch. Use variety both in bread and fillings. White bread, rye bread, whole wheat bread, raisin bread, steamed brown bread as well as wholesome rolls and biscuits, may be used in succession. Chopped meat, cream cheese, ground nuts, peanut butter, date, raisin and fig pastes, jellies and marmalades make up a great variety of fillings.

Eggs are always acceptable in a lunch. They may be hard-boiled or stuffed in various ways.

Simple cakes or wholesome cookies made especially for the lunches are better than left over remnants of the dinner table. Sponge cakes are very wholesome. Gingerbread is always appetizing with its spicy odor, and animal ginger cookies are a source of delight. Simple puddings in great variety or just the plain cup custards offer much nourishment in small bulk.

Rich, creamy milk may be carried in a small bottle, or on cold and rainy days hot soup or cocoa may be carried in a thermos bottle. Nothing is more nourishing in the way of a drink than thoroughly boiled cocoa.

School Lunches Relished By the Average Child

Cheese sandwiches (two slices), lettuce, apple, sponge cake.

Two graham sandwiches (fig and nut filling), cup custard, half dozen hard water crackers.

Minced lamb and celery sandwiches (white bread), grapes, peanut cookies.

Two slices of nut bread, apple and celery salad, cream cheese, ginger bread.

Steamed brown bread and butter sandwiches, rice pudding with seedless raisins, orange.

For a cold or rainy day—Bacon sandwiches, jar of potato salad, ripe olives, banana, hot cocoa.—Charlotte M. Hoak, South Pasadena.

The Great Home Builder

WHAT after all is more worth while than bringing comfort and safety into the home? Think what the telephone has done to tie the country house to the town and the town to the city. Don't be isolated. Get into touch with the voice of the big outside world. Know the prices that rule on farm products. Know about the party at your neighbor's house. Bring to your whole family the safety that comes with the knowledge that in the time of illness or fire the whole community is within call.

Kellogg Telephones

have won their way into homes all over America because of the quality of service they give. Did you know there is a big difference in telephones? There is. Kellogg phones have to undergo an inspection more rigid than other makes. They pass through 37 distinct tests before they leave the factory. That means dollars and cents to you.

As a matter of fact, it is not uncommon for the repairs to cheaper telephones to cost in a few years more than the first cost. Kellogg instruments go on year after year carrying the most delicate sounds perfectly without repairs.

Kellogg Transmitter is guaranteed for five years. A Kellogg lightning protector goes with every phone.

Every part of the instrument is strong, simple and durable. Big, powerful generator that will ring efficiently with 40 telephones on the line. Unbreakable receiver and transmitter mouth-piece. Long life batteries. Secret service push button to ring "Central" without ringing your neighbors.

Let us help you in planning your line. We can tell you how to avoid mistakes and save money. Our expert help costs you nothing.

Literature and bulletins giving the latest ideas about telephone construction sent free.

300,000 Country Homes Have Solved Their Lighting and Cooking Problems

These 300,000 families have solved this big important problem for good and all, by installing the **Pilot Lighting and Cooking Plant**. They now light their houses, barns, outbuildings, porches and roadways and cook their meals the same as if the city gas mains ran past their doors.

The verdict of this great army of **Pilot** users is universal satisfaction. For this is the greatest improvement—the one all the family enjoys the year round—the one it has always wanted.

You profit by the experience of these 300,000 families. You can obtain this same proven satisfactory lighting and cooking service for your home.

PILOT Lighting and Cooking Plant

is different from all other types of private plants for country homes. Beyond question, it makes acetylene the cheapest, safest and most convenient light and cooking fuel now available for every home wherever it is located.

Write for our handsomely illustrated, descriptive booklets giving all the facts about this modern lighting and cooking service. Tell us the number of rooms in your house, how many barns and out-buildings you have to be lighted, the number you cook for, and we will send an exact estimate showing how little a complete **Pilot Lighting and Cooking Plant** will come to for your home. This we will be glad to do without the slightest cost or obligation. Send us this information today while you have it in mind. Address our nearest office.—Department W.

THE SCHOOL LUNCH

The object of the school lunch should be to supply in compact form wholesome, nutritious food, sufficiently varied to meet the demands of the growing body and at the same time interfering the least possible with the activities of the mind. A little studied thought will enable one to make this selection. It is a great mistake when a mother regulates her children's diet by her own demands, for all she needs is enough to furnish energy and repair waste, while every muscle, nerve and bone in the child's body is demanding food for growth.

The growing school child will appropriate a greater amount of sweets and starch than an adult. Let this natural craving for sweets be met in such articles as figs, dates, raisins, steamed dried French prunes and pure honey. Let the proteids be confined more to the easily digested sorts, as milk and eggs with white-fish when meat is desired. Beans, peas, lentils and nuts are rich in protein and are good substitutes for meats. Use whole wheat, graham and rye flour, corn meal and corn, hominy, oats and less fine flour. These, with such vegetables as can be used cold, and plenty of fresh fruits in their season may form the basis for a great variety of substantial and appetizing school lunches. The requirement of each child should be considered, for the child who trudges a long distance over country roads naturally requires different food from the one who rides to school or walks only a short distance.

If possible have a few of the small baking dishes known as ramekins so that when baking dessert a small dish can be baked for the lunch box for, as a rule, the children think them nicer when in an individual dish. An attractively arranged luncheon has much to recommend it. Keep ready for packing the lunch box a roll of waxed paper and a package of Japanese paper napkins. Let sandwiches, cakes, etc., be wrapped separately to prevent drying or absorbing flavors from other foods. A small flask may be used for carrying milk. Delectable dainties to be carried in cups or small screw top jars are cup custards, rice and tapioca puddings, blanc mange, junket, etc., or a tightly covered jelly glass for carrying baked apple, canned or stewed fruit. A spoon and a drinking cup should also form a part of the lunch box equipment. If a special place on the pantry shelf or in a drawer is kept for these furnishings the work of putting up the lunch is reduced to a minimum. Scooped out rolls make excellent receptacles for a little salad, or scrambled eggs and many other things which, while supposed to be eaten not, are really good cold.

Instead of the heavy pie, cake and doughnuts that so often go into the school lunch box have whole wheat, graham or rice wafers, sponge cake and raisin, date or fig bread.

The sandwich, which is the main feature of the lunch, may be supplied in many pleasing and appetizing combinations which may be made of various breads, using such fillings as will harmonize with the menu they are to accompany. In preparing the sandwich cut the bread into one-fourth inch slices. When butter is used let it be of the sweetest, and if inclined to be too hard to spread well, work it with a silver knife or small wooden spoon until creamy and it will not crumble the most delicate bread. Cut into the desired shape, wrap in paraffin paper and a dainty, fresh sandwich will be the result.

Delicious sandwich filling may be made of cottage cheese mixed with chopped nuts or chopped olives and moistened with cream, or spread the bread with mayonnaise with a layer of chopped olives between slices.

Egg filling—Three hard-boiled egg yolks, one tablespoon thick cream, lemon juice and salt to taste. When well mixed spread on thin slices of buttered bread.

Lettuce mixture filling—Finely chopped lettuce with a little onion and celery made into a paste by adding a mixture of hard-boiled yolks dissolved in a little thick cream or olive oil. Add salt and lemon juice to taste. A nut preparation called Nuttoline added to the above mixture makes a delicious sandwich filling.

Add the Nuttoline according to taste.

A potato sandwich is a favorite with some children and is prepared by placing between thin slices of buttered bread, mashed potatoes, well seasoned with cream or butter, finely chopped onion, parsley and celery if such seasoning is liked.

Lima Bean Filling—Soak lima beans for several hours, when the outer skin or hull can be easily slipped off between the fingers. Put to cook in boiling water. Boil until tender, then simmer slowly, cooking as dry as possible without scorching. When about half cooked add several chopped celery stalks, a bit of onion and a small spray of green sage, if desired, and salt. When done season with thick cream.

Vegetable sandwich filling—One cup cold string beans mashed to a pulp with a silver fork, olive oil, salt and lemon juice to taste. Cold asparagus and green peas are equally good for these sandwich fillings. Sliced cucumber or tomato make a very refreshing and appetizing sandwich.—Miss A. Butcher, Healdsburg.

SCHOOL LUNCHES

The school lunch is often an unpleasant thing, both for the one who prepares it and the one who eats it. I have officiated in both capacities for several years as pupil, teacher and homekeeper.

If certain rules are followed the task becomes more pleasant, for the worker finds satisfaction in making the luncheon as dainty and attractive as possible, and when the child opens his lunch box at noon he finds an appetizing little picnic dinner which digests easily and helps him to avoid that dull, listless afternoon period which all teachers dread and which in many cases is caused by eating unpalatable and indigestible foods.

Simple, easily digested lunches may contain plain and sweet sandwiches (preferably of graham or whole wheat bread), sliced meats, boiled eggs, cookies or cake, fruit, especially apples, oranges and bananas. Some of the softer fruits do not pack well and sometimes spoil the whole lunch. An occasional surprise dish may be added to the usual lunch of sandwiches and fruit. This may consist of a custard or bread pudding, potato salad, stewed prunes and peaches, etc. Avoid sending pie; it does not carry well usually and is not good for the child. Radishes, carefully washed and dried on a cloth often add to the lunch. Pickles should be used sparingly as they are indigestible.

Try to have something different in the lunch box every day. At least prepare it in a different way. If you had sliced beef sandwiches yesterday today mince the beef and mix with a little sweet chili sauce or boiled salad dressing. Variety is the spice of the school luncheon.

Some sandwiches I have found very good are these: Cheese and nuts ground together, raisins and nuts ground, chipped beef, chili sauce, pimiento (spread very thin), salad dressing, marmalade, especially apricot and orange. Cold chicken, beef and mutton, prepared mustard, banana (slice thin), Dutch cheese, lettuce, sardines (mince fine.)

For all of these sandwiches use bread cut rather thin, spread evenly with butter and any of the mixtures. Always cream the butter so it will spread smoothly. Do not put in all sweet sandwiches, nor too much cake and sweets. The nut and cheese fillings are good to use in place of meat.

Wrap all sandwiches in paper (waxed if possible) cookies and cake in separate papers, and place the egg or fruit at the side, not on top where it will crush into the sandwiches. A little time and thought spent on your child's luncheon will do much toward making him happier and healthier.—Mrs. Alice Hendershot, Van Nuys.

SCHOOL LUNCHES

When children reach the age where school keeps them away from a hot dinner at noon the chief meal must be given at night. Cooked fat is to be avoided, such as occurs in fried foods, pies and rich cakes. If a child is intelligently fed he should not readily succumb to colds and other children's diseases. Toast, hard, unsweetened

crackers and butter are much better than soft bread. Any of the following are easily made:

Boston Brown Bread—One cup whole wheat flour, one cup corn meal, half cup warm water, half cup molasses, one cup thick sour milk, three-fourths level teaspoon salt, one and one-half teaspoon soda, one cup raisins. Preparation, ten minutes; steaming three hours. Mix dry ingredients first, add milk, water, molasses and mix well. This bread makes excellent sandwiches with lettuce and nuts.

Very Plain Tea Cake—Half cup of butter, two cups sugar. Work sugar and butter together. Add four beaten eggs, three teacups sifted flour, an even teaspoon soda dissolved and

strained, ground nuts and lastly, a teacup sour milk.

Fruit Paste—This is suitable for fruit tarts generally, apples, perhaps, excepted, for which we recommend a puff paste. To three-quarters of a pound of butter put one and one-half pounds flour, three or four ounces sifted loaf sugar, yolks of two eggs, half pint of new milk. Bake in a moderate oven. Nuts and fruits are easily kept on the shelves for the lunches.—Miss Mae Turner, Woodland.

SUGGESTIONS FOR SCHOOL CHILDREN'S LUNCHES

No lunch being complete without sandwiches, one of the first requisites is fresh, wholesome bread.

Various kinds of meat sandwiches can be formed, as every mother knows, sliced boiled ham, deviled ham, tongue, tuna, chicken, etc. Odd bits of cold meats left from the previous meal, when ground and mixed with mayonnaise or a boiled dressing are very appetizing.

Lettuce leaves between many kinds of sandwiches improve them greatly. Graham bread can also be alternated with the white, which makes a variety and is good for the growing children.

Cheese filling, when combined with bits of chopped pimiento, is often relished. Cucumber pickles sliced thinly and placed between the common bread, butter and lettuce sandwich, as well as hard boiled eggs mashed with a fork and seasoned to taste will be found good.

Most every child is fond of peanut butter or jelly between thin slices of bread and butter. Raisin bread is often used.

Either beet or cucumber pickles give an added relish to the lunch as well as radishes and celery in season.

Fresh fruit of some variety is available in California most of the year around and nothing is more healthful, nor more fully enjoyed.

Children are usually very fond of cookies and doughnuts. Most every mother has her own favorite recipes for making these, but for the one who does not do her own baking, these may be obtained from the bakery. A one-egg cake may be baked in gem pans, and gives the child the idea of an individual cake, without much time or expense. These may be frosted if time permits.

I knew one mother who used to bake small pies in tiny individual pans, and you can imagine how much they were enjoyed by the youngsters.

By wrapping each article in oiled paper which may be obtained at a small cost, every part of the lunch will taste fresh and will be as much enjoyed by the child as if it were eaten from the dining table.—Ruth Marie Myers, Escondido.

CHILDREN'S LUNCHES

If you will keep before you two watchwords while planning the children's lunches the lunches will less often find their way to the janitor's chickens and more frequently into the little mouths they are planned for, and these are variety and daintiness. A lunch can be substantial and yet as dainty and varied as a mother's time will permit. Don't put in the same thing in the same old red-bordered napkin every day. A few paper napkins in varied borders and designs, pumpkins, kittens, leaves, fruit, etc., kept on hand will help wonderfully. Oiled paper, too, "makes things look so good" besides keeping them fresher. What child doesn't like surprises, and where is there a better place for them than in the lunch box? A gingerbread man, a tiny cake, a bit of good candy, anything for variety. And don't forget the children's craving for sweets and do supply it outside of the candy store by nature's ways as far as possible. Honey and good maple syrup stand first here, cane sugar and penny candy at the foot of the list. Teach children to avoid the latter as the plague, but give them something in its place.

And don't forget fruit here in this state of fruits the year through, "an apple a day" if nothing else is available, but usually something else can be found. A bit of fruit in a tightly covered jar with a spoon to eat it with will taste so good sometimes.

GAS SUPPLY FOR THE
COUNTRY
HOME

HOME-MADE ACETYLENE

Not only supplies
good light—but
cooking fuel as well

Other light systems furnish you light only. Home-made Acetylene furnishes you with the finest light in the world and a perfect cooking fuel as well. You simply fill a modern acetylene generator with the gas-producing stone, Union Carbide, about once a month; the generator automatically makes the gas as you use it.

You will find acetylene to be the whitest, softest and most beautifully brilliant of all illuminants. It will make the old homestead attractive and cheerful—it will help to keep everybody happy and contented—and, best of all, it will relieve the women folks forever of the bother of handling ancient, greasy, kerosene lamps.

You will laugh with joy at the ease with which you can cook the breakfast on an acetylene range—no kindling—no soot—no wood—no coal—no ashes—no surplus heat in your kitchen. You just jump out of bed and strike a match and your coffee and eggs are all ready in a few seconds.

The simple little generator you require to make home-made acetylene will be worth more to you than a heating plant. The cost is insignificant considering the benefits. Modern acetylene plants are wonderful improvements over the old. The Union Carbide you would use in such a plant is now carried in warehouses convenient to users in practically every town and city, and is as safe to store and handle as coal.

Write us today for particulars.

Citrus Fruit Market

LOS ANGELES, Nov. 23, 1915.

Valencias have come to their own and almost entirely taken the Thanksgiving market. Neither California nor Florida Navels have been sufficiently ripened and as yet are being held back until they can show the eight to one test. In Florida this is controlled by state law and in California by the will of the shippers with a desire to work in harmony with the rulings of the department of agriculture as to what constitutes ripe oranges.

Lemons are showing even better than at time of last week's report. Practically all fruit now being picked is going forward immediately. The fruit from the Mediterranean is lighter in receipt than for several years at this time.

Shipments

Shipments of oranges from Southern California to date since November 1: 395 cars, lemons 219, total 614. To same date last season: oranges 251, lemons 217, total 468. From Central California this season: oranges 46, lemons 30, total 76. Last season same date: oranges 132, lemons 37, total 169. From Northern California to date: oranges 12. Same date last season, 28.

NEW YORK, Nov. 22.—Fourteen cars Valencias, one car lemons sold. Market is strong and higher on oranges and lemons. Weather fair.

CHILDREN'S LUNCHES

Continued from Page 525

Anything in a jar is good, a left-over vegetable or a bit of salad may be made very tempting.

In sandwiches great variety can be obtained also. Sometimes toast the bread; sometimes cut it in different shape; but don't, as you value your child's health, use white bread day after day. The coarser breads are usually preferred by children and they are certainly far better for them.

And lastly, the biggest don't of all, don't let a child take a lunch unless it is absolutely necessary, but if it cannot be avoided then put up the most tempting lunch possible instead of giving the child a dime and trusting to luck that it will not go for pickles and candy to treat the crowd.

Lunches for One Week

Monday—Lettuce and graham bread sandwich, jelly and graham bread sandwich, tiny pot of cold baked beans, one ginger cookie, one apple.

Tuesday—Egg and graham bread sandwich, apple turnover, ginger bread.

Wednesday—Toasted bread and bacon sandwich, jar of apple sauce, one cookie, one large peach.

Thursday—Graham bread and honey sandwich, peanut butter sandwich, jar of salad (very little dressing), banana.

Friday—One bun, buttered, stuffed egg wrapped in lettuce, graham crack-

ers, jar of maple syrup or honey.

Why not slip in an extra bit some times for the child to share with some one? Could one teach generosity in a better way?—Mrs. L. L. M.

LOS ANGELES COUNTY FARM BUREAU

At a meeting held last Saturday and attended by men representing the various chamber of commerce and farmers' organizations throughout Los Angeles County definite steps were taken toward bettering agricultural conditions. The purpose of this meeting was to agitate a movement and formulate plans which will result in appointing a county farm adviser.

It was decided to call a meeting during the latter part of December to organize a county farm bureau at which time talks will be made by Dr. Thomas F. Hunt, member of the college of agriculture, and others interested in improving agricultural conditions are especially urged to be present.

Those appointed to act as an executive committee are: J. H. Norton, chairman, president of Gardena Valley chamber of commerce; D. B. Livingston, secretary of Long Beach chamber of commerce; R. W. Hadden, secretary of Ocean Park chamber of commerce; Jerome Reynolds, secretary of Covina Valley Farmers' Club; J. W. Williamson, Downey; W. W. Felgate, Sierra Madre chamber of commerce; Murray J. Black, Los Angeles.

Rice growers are taking steps to secure more just treatment in the matter of freight rates for rice from the Sacramento Valley. The freight is now one and a half the rate on barley.

Stop Losing Money

If your clipper bruises an orange's skin you open the way to decay. The cut may be too small to notice—one decaying orange may spoil an entire box. You won't bruise fruit if you use **WISS ORANGE CLIPPERS**

The blades are specially curved and ground; the points and outer edges are rounded to avoid bruising.

U. S. Government experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they last longest, do best work and save money by minimizing the liability of bruising the fruit.

Tobacco Co.

**"Well,
smoke it yourself
if you want that
all-fired
joy-feeling!"**

Prince Albert is the cross-lots cut to tobacco satisfaction, whether you smoke a jimmy pipe or makin's cigarette! It hands out more genuine happiness each puff, and fresher fragrance each puff than you ever did dream would fall to your lot. The patented

process fixes that—and cuts out bite and parch! From dawn's early light until turn-in-time you can smoke away, man-like, because there isn't any unpleasant comeback in

PRINCE ALBERT

the national joy smoke

Don't linger about what you're going to do about this pipe-packing and makin's-material question. Because, men, you're losing fun and contentment.

You buy some Prince Albert in the tippy red bag at a nickel or get a tidy red tin for a dime; or pick the handsome pound and half-pound tin humidors. But of all the P. A. packages, you'll find that classy crystal-glass pound humidor what you *need most!* The sponge-moistener top keeps the friendly tobacco in such bang-up trim!

Little Stories of Success

No. 10

Possibly you still look upon the Caterpillar as a big farm proposition, and are not yet convinced that it is a cheaper and better form of tractive power than horses. Listen!

E. A. Brim of Williams says: "Having used a Caterpillar almost 3 years, doing all kinds of work, I find that the expense of this work is at least one-half less than doing the same work with teams."

Cy Hermle, Winters, says: "I figure the Caterpillar is half cheaper than mules, counting all wear and tear."

Sleeper and Waller, Santa Ana, says: "In figuring the difference in cost against mules, we made a saving of \$850 during our harvest."

Can you afford to plow with teams any longer? Figure it out, interest, depreciation, feed, everything. Then write us for the actual costs of doing work with a Caterpillar "30" as reported to us by Caterpillar owners.

\$675 Mogul 8-16 \$675
Oil-Burning Tractor

HOW well you know it! "The average farm does not possess sufficient power to do the plowing at the right time and to the proper depth." Consider the many times you have lost patience with sick horses, sore shoulders, bad weather.

Use your horses for the work they are fitted for. Plow, disk, harrow, seed, and harvest with a Mogul 8-16 oil-burning tractor. Then you can plow at the right time and as deep as you please.

After a season's experience with a Mogul 8-16, one farmer wrote us these memorable words, "It is the greatest one-man, efficiency tool I know of. With it, one man is equal to several teams and a gang of men. 'Let the tractor do it,' has become our farm slogan."

When the farmers of this country appreciate all that a Mogul 8-16 will do, and the low cost of using it, there will be easier times for men and horses, and more work done, on thousands of American farms.

Mogul 8-16—The Small-Farm Tractor for All Farm Work—is delivered to you for \$675 cash, f. o. b. Chicago. Get posted on this wonderful little machine. Begin now to "Let the tractor do it" on your farm. Write us for full information.

**For Water Deep Under
The Ground**

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

Clubbing Price List Season 1915-1916

This list is prepared annually for the benefit of Cultivator subscribers. The prices given allow our readers the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to the Cultivator (Class 18) be added at 90c (regular price \$1.00 per year).

We can supply any periodical published. The lowest price of any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage, and prices must be obtained by correspondence. Subscriptions may be either "new" or "renewals" (except where otherwise stated in the list), but it is important that this information be given in each case.

The pricing of various combinations of magazines is a simple matter; all are listed according to class number, and this class number multiplied by 5 gives the cost price.

One-Man Power Sprayer

A Complete High-Grade Outfit at Small Cost

Here's the rig thousands of small farmers, orchardists and vineyardists have been looking for—a dependable, reliable, efficient, high-pressure power sprayer at small cost. One man does all the spraying. One horse can haul it anywhere. Supplies one line of hose and will cover from 2 to 3 acres a day. This is the first time you have been offered Bean quality in a low-priced outfit. Note these features of the

BEAN EUREKA

LIGHT WEIGHT—Makes it an easy pull for one horse and a mighty handy sprayer for rough and hilly land.

INEXPENSIVE TO OPERATE—One man does it all. Low first cost and practically no cost of upkeep.

NOVO ENGINE—as sturdy a sprayer engine as you can find. Novo spells satisfaction.

ALL COMPLETE—Including Patented Pressure Regulator, Rotary Agitator, Truck, Canvas Cover and Curtains, Hose, Rod, and everything complete.

THIRTY YEARS OF EXPERIENCE are back of the Bean Eureka—and experience counts.

WRITE FOR NEW CATALOG

We have just issued the largest and finest catalog we have ever offered. It illustrates and describes the entire Bean line of Hand and Power Sprayers, including several new outfits and many new improvements. A post card will bring it.

Bean Spray Pump Co.

How to Increase Consumption of Fruit

James Madison, Manager of the Associated Raisin Company, Addresses State Fruit Growers Convention as to Creating Greater Demand for Our Fruits and in Fact All Farm Products. Cooperation Only Solution

I HAVE not prepared a speech but am going to give you a few statistics on the subject of "How to Increase the Consumption of Our Fruits." We should include all products, for if the farmer, who is the originator of all real new wealth, is prosperous, the whole country is prosperous. He is the one who furnishes the necessary money to set the wheels of commerce in motion, which reaches out to every branch of trade, and the farmer can only be prosperous if his products are properly marketed, so that he gets a just return for his labor and investment. There is such a thing as getting too much, and it is a hard matter to regulate it. In most cases it is the reverse, he does not get what he should have and what he should obtain without any injustice or injury to any person in the whole country.

If you can increase the consumption of your fruits you have practically solved the biggest part of that question of making the farmer prosperous, because if the consumptive demand is greater than the supply prices will automatically be raised. The question is this—if prices do increase, does the farmer get that increase? Most of the time he does not. Take your prunes—60 days ago they were worth three to three and one-half cents, today they are worth five and one-half cents. Now why did not Mr. Farmer get this? For the simple reason that he was not adequately posted on conditions, and he cannot be, for the reason that he has only a small circle around him, and the man who deals in these commodities endeavors to find out from all sources as to the available supply.

Government Assisting

The United States government has undoubtedly seen the wisdom of assisting the farmer in marketing his products, to the best advantage for the farmer. It allows the farmers to cooperate, by getting together and forming all kinds of agreements for their products, as long as they do not go beyond that point, forming corporations for controlling certain products. If you undertake to manipulate the packing or manufacturing interests you are up against the trust laws of this country, but so long as you combine your products for the purpose of selling them in a collective way to your own advantage, the government will help you. Therefore the government has seen the value of all cooperative work. It is absolutely necessary if you want to increase the consumption of your fruits. Has any individual thought how he could do the least thing toward increasing the consumption? I do not believe there is any one who can plan or think out a scheme whereby individual work can accomplish anything. The United States and Canada, where we sell most of our products, is a large territory, and an individual cannot afford to go himself, nor can he afford to send out drummers to sell the small quantity he may have, and it is only by large organizations that such work can be done successfully.

Campaign to Increase Consumption

I will take, for example, the Associated Raisin Company, that you have all heard something about. We are expending about \$150,000 annually in

advertising and salesmanship, and I will give you a concise statement of how we have already begun to see the result of that work. The bakers, as you know, all use more or less raisins. When we started our campaign of advertising we thought there was a possibility of our getting the bakers throughout the United States to use raisins in bread and other ways, and found that by sending a man into most any little town, who talked to the bakers about it, that you could get them to buy one, two or three boxes of raisins, according to the size of the bakery. We took that up with our advertising people, and have all this year been working on the bakers throughout the United States. In our opinion they were the largest consumers, and we thought there would be where we could see the increased consumption more quickly than in the homes.

All of you here in the San Joaquin Valley are quite familiar with the overproduction of raisins we were supposed to have. In the spring of 1913, when our association was formed, there were 36,000 tons of raisins in the state. It was not an overproduction; it was an underconsumption that was the trouble. Therefore, we started out with a view of increasing consumption, and the bakers were the ones we tackled first. We started an active campaign last April, and we know this increased consumption, for the bakers were using Thompsons and Sultanas, and also some bulk seeded; but they would buy but a few pounds at a time, whereas now they buy in very much larger quantities, as we are now packing the bulk seeded in 25-pound boxes, and where they formerly bought a pound or two, they now buy by the box. During the year 1914 we sold 62,573 25-pound boxes of bulk seeded raisins. We have this year, up to the first day of November, sold 350,806 boxes; or, during the ten months of the year 1914, we sold 53,000 boxes as against 350,806 boxes in ten months this year. You can of course see that it will take money to cover such a large territory with advertising or with specialty work, and when you figure it out what does it amount to, or what is the difference what the cost is so long as you get results? And it is legitimate results that count. Supposing we are spending \$150,000 a year, that is equal to about \$1.50 per ton on the raisins we handle, and if by spending that money we can increase the value of raisins one-eighth cent per pound, that is \$2.50 per ton, we have made clear for the owners of that commodity above the expense, \$100,000. Therefore, I have always reasoned that we should never be afraid of expense, provided we can get results.

To show you the value of proper marketing, it may interest you to know what difference it makes to the producer in California whether he gets one cent more or less on some of his commodities.

In the month of October there was shipped out of this state 3058 tons of apricots at two cents per pound too low a price, or \$120,000 loss to the apricot growers; beans, 24,830 tons, and, as they have been disorganized for the last two or three years I do not know how much loss they sustained; miscellaneous dried fruits, 4163 tons; figs, 2227 tons; peaches

6266 tons, and how much their loss on peaches was I will leave the growers to answer; raisins, 41,106 tons; prunes, 38,896 tons; nuts, 8679 tons; or a grand total of 129,165 tons of dried fruits and beans that were shipped out of this state in one month.

Cutting Selling Cost

Regarding the shipment of raisins, I will say that it is the largest there has ever been in the history of the raisin industry. Now if by improved methods you would increase consumption so that the consumptive demand would warrant that you obtain an additional cent per pound, the one cent per pound would amount to \$2,500,000. On most all of these commodities one cent per pound one way or the other does not change the retail price one iota. There is where the great trouble generally lies. It is the loss that is sustained between the producer and consumer and as long as the consumer does not get the benefit of the cheap prices, why should not we, "the producers," get all it will stand between the producer and consumer. The very first man you want to eliminate is the speculator. We have absolutely eliminated him out of the raisin business, and he likes me very much for it, I do not think; but he is the biggest enemy of both parties, as he serves no purpose except his own.

The next is the cost of doing business. It has never been thought before that the dried fruit man could do business for less than five per cent commission. When we started our association I advocated three per cent commission, and it was finally compromised on four per cent, a saving of one per cent on the business our company does, or from \$75,000 to \$90,000 per annum. This sum was absolutely wasted before, as the brokers gave it away to the buyer or the wholesaler who put that in his pocket as an additional profit.

Freight and transportation cuts a very large figure in the marketing of your products, and every dollar you can save in that direction the producer gets at least part of. When freights went down about 60 days ago between here and New York we could have raised the price of our raisins one-fourth cent per pound, and they would not have cost the Eastern buyers any more than formerly and the growers here would have obtained the one-fourth cent on account of the reduction in freight.

Educational Publicity

The consumption of our fruits throughout the East is to a large extent a matter of education. I want to say right here that not half enough is known throughout the country about how to use our fruits and how they are produced and manufactured. We have learned this year at the exposition in San Francisco how few had any idea as to how raisins were produced, much less how they were seeded by machinery. It has been the biggest revelation that most of the ladies, especially, have had at the fair, to know that the raisins were seeded in a clean, sanitary way, and how those seeds were taken out. The number of communications and inquiries we received was remarkable, and demonstrates how little the general public knows about our California

fruits. I stopped at one of our packing houses on the way down, and a prosperous farmer, well along in years, said to me: "I notice you invite the raisin growers to come in and see you seed raisins." And I said that we did and asked him if he had ever seen it done. He replied that he never had, that he had been a grower for 25 years, but he had never seen raisins being seeded. If we do not know ourselves how this is done, how can we expect the public to know it?

I am well satisfied that education in all directions regarding the use of our California products would stimulate and increase consumption as much as anything that could be done.

Distributing Recipes

We advertised that we would give away a small recipe book, showing the different ways to use raisins, and shortly after that our mail increased to 2500 or 3000 letters per day, all asking for that book. I am well satisfied that individual advertising and spreading of knowledge about how to use any of our fruits would be very beneficial and increase consumption. At the same time we must give them the very best quality, for our California fruits have been greatly injured by the poor quality—I very nearly said rotten stuff—that has been shipped out of the state by unscrupulous packers. Supposing the housewife bought a pound of peaches and after she got home found they were dark and wormy. She might use them, but she certainly would never buy them again; whereas, if she had gotten a pound of good peaches she certainly would have tried them again. Therefore it is imperative that you get the goods to the consumer in the same way that you would like to consume them yourself. It is not alone necessary to do that once, but you must continue to do it.

If we once get the people started to using raisins in bread and cake, by and by they will get the habit, and will consume more raisins than we are now producing in the state of California. Two pounds per capita in this country would more than consume all we had. We have Canada to supply and we are now supplying the world, owing to the unfortunate war in Europe.

What a fine thing it would be if we could increase the demand for raisins so that we would have to plant more vineyards, and we may see that inside of the next three or four years if we do not have too many of those selfish narrow-minded fellows to contend with, that the Associated Raisin Company will not have enough raisins to supply the demand.

While on that subject I want to say that about the first of July we had about 30,000 tons of raisins in our warehouses and with the biggest crop coming on that the state has ever produced. How would you have marketed them? There was enough here in the hands of the growers to possibly fill the demand, which has generally been about 35,000 tons. Every grower would have fallen all over himself trying to sell his old crop, and his new crop would have brought him nothing, and he knows it. But the situation is this, we will have no more raisins on hand January 1, 1916, than we did on January 1 of this year.

and then take his advice on what to plant

Read what
Prof. Wickson
Says →

Can you tell by sight of a tree or vine whether it has vigor best for fruit bearing or whether it is exuberant or deficient, and do you know what to do in either case? Can you tell by sight of a tree or vine whether it is pruned to have the right amount of bearing wood and is arranged to give the right strength and exposure for best development? Do you understand what recent soil studies are demonstrating about food, texture and content of plant soil, and the effect of these factors on the growth of the tree or vine? Do you realize that the common conception of the tree or vine is wrong? Do you appreciate the fact that the unseen parts of the tree have perhaps a greater and more varied sphere of activity than the top of the tree and demand at least equal cultural consideration? Do you know exactly why ship-pers, cannerymen and other fruit consumers will pay more for some varieties of fruit, less for other and will wholly reject others—all being of the same kind of fruit? Do you realize that there are some extremely dangerous things to do in fruit planting, to blindly imitate and to blindly plunge? To put in or pull out what every one else is putting or pulling, is to be out of the game when the turn comes. To plant with some new thing which no one else is planting, with the idea of getting the start of everybody, may be a wonderful bit in supplying a tourist hotel, but it is as deadly as solitary confinement in connection with the general commercial demand. Citrus

and

Fruits

OBSERVATIONS BY EASTERN EXPERT

By Geo. T. Powell

It was my pleasure and privilege to spend a little more than two months, from February to May, in a careful study of the soil, climate, productions, and particularly the citrus industry of Southern California. During that time, I went over 4000 miles of the state by auto, which gave a most favorable opportunity to study conditions with considerable minuteness.

The Soil

I have never gone over an equal territory in which the soil interested me more in its wide variation from sand to heavy clay, adobe, silt, gravel, loams of differing character and some very stony. It is these soil variations that make possible the great variety of products that are grown in the state.

While the climate has much to do with the growth of many kinds of trees and plants, the soil is a large and determining factor affecting their best development.

As in other sections of our country where there are soils of differing character, I observed that some owners of land were making the mistake of trying to produce certain crops that were not suited to the soil upon which they were being grown. This was particularly noticeable with the citrus fruits which have been planted over a large territory in which these soil variations occur. In a few sections the orange and lemon plantings of long standing indicated a condition of decline, the cause for which is not fully understood. This may be a possible result following the production of one crop continually over a long period of time.

The growth of a certain kind of trees producing fruit for a third of a century or more under one system of culture takes out of the soil not only the plant food essential to the trees and fruit, but the physical character of the soil becomes so changed that even though it may still have an abundance of plant food it may not be sufficiently available for the trees to fulfill properly their function of production.

In the plant world rotation is a law of nature, one species following another, each taking out and returning to the soil different constituents without leaving the soil depleted.

Most of the soil of California is practically inexhaustible, so richly is it endowed with mineral plant food, but its one great need, as I studied it, is organic or vegetable matter. This is best supplied by animal manures, but these are not obtainable in sufficient quantity to meet the requirements of so large an acreage under citrus culture. Cover crops for green manuring were very generally observed. Some of these grown, as rye, barley and buckwheat, are not so valuable as the clovers, beans, peas, vetch, alfalfa and others of the leguminous family. While the first mentioned do add some vegetable matter to the soil, they do not produce the same effect in the fermentive processes as animal manures and the legumes which stimulate active bacterial life in the soil. These bacteria produce marked beneficial effects upon the soil mechanically in addition to making more available the mineral constituents with which the soil is abundantly supplied.

The Melilotus clover was found growing in many orchards. As a cover crop it seemed most promising. It will not only make a large amount of vegetable matter, but its deep root penetration will prove of exceptional benefit to the soil. There is no doubt but that this plant will be found to be of high value followed by the increased quantity of fruit produced, as also in its improved quality.

The purple vetch was also seen growing in several places with prom-

ise of large value as a cover crop. The discovery of the ability of the leguminous plants to abstract nitrogen from the air and build it up in the soil through the agency of their roots would have been likened unto a miracle in olden times. California need never have fear of a shortage of nitrogen which may always be had abundantly at the lowest possible cost through these and other leguminous plants.

While making examination of the soil in a number of different localities, I was quite surprised to find in some instances a heavy lifeless soil with little humus in it, yet the soil was well supplied with plant food to a depth of 30 feet or more. The orange and lemon trees in the soil showing this condition were not thrifty, the foliage was not natural, while many trees were producing little or no fruit. Without strong and luxuriant foliage but little fruit may be expected and that of low grade in quality.

Irrigation

With an annual rainfall ranging from ten to 30 inches in Southern California, with a semiarid climate, precipitation being mainly in the winter months, an artificial system of supplying water has to be adopted for the growing of crops. This has advantages and it also is attended by some disadvantages. The advantages are in the insurance of crops which may be supplied with water when they most need it. The disadvantages are in results that follow from the unintelligent use of the water.

The problem that arose most prominently when studying the irrigation system was, with the very great extension of the citrus planting, together with largely increased areas of market gardening, alfalfa and other crops, where is the water to be obtained with which to meet this enormous future demand for it?

There was evidence that too much water was being used by some growers, for in some instances 12 inches below the surface the soil was as hard as much of the hard-pan formation that is met in sections of the Eastern states.

Under such condition the winter rainfall does not sink in the soil very far. The subsoil is constantly dry and is slow in taking in much of the water. The winter rain not being taken up rapidly enough by the deep dry subsoil sweeps over the surface, making at times wide rivers which carry away much valuable soil from the beautiful valleys over which the water is forced to flow.

By the shallow plowing that in many instances is done, especially where the soil is of a clay type, with more or less of silt, the soil becomes hardened under the plow, almost impervious through puddling; the water being unable to sink into the subsoil, and consequently there is less to come up later on by capillarity. The roots of trees and plants require air as much as water. They are deprived of air and the benefit from oxygen under a hardened soil, the same as from being submerged in water.

It is the history of all countries where irrigation is practiced that in time soil troubles arise which are the result of the unintelligent use of water. Some most interesting work was met where heavy leguminous crops were being plowed in to a depth of 16 inches, with less water applied but more fine surface tillage given to conserve the moisture in the soil.

Very heavy crops of clover were in some instances being disked into the soil, while a thick layer of the clover was piled underneath the orange and lemon trees, and a less quantity of water was applied without tillage.

The aim was to form a surface mulch that would hold the water and allow it to sink more slowly and more deeply into the soil, while it would prevent too rapid evaporation. The object of this experimental work was

to conserve the water from the winter rains over a longer period, when it was thought less would be required from irrigation. As the population of the state increases and larger areas of soil are put under cultivation, this very intelligent experimental work by some of the large citrus growers to determine if some of the difficulties that arise from the system of artificial irrigation may be averted, will prove of interest and without doubt of much value to the industries of the state.

It would be a very wise policy for the state to inaugurate a system of impounding the flood waters of the winter for future use, which now do great damage to many thousands of acres of most valuable soil, while entailing upon taxpayers an enormous cost for the reconstruction of damaged roads and bridges.

(To Be Continued)

CARRYING THE WAR TO CONGRESS

The citrus canker committee, with headquarters at Tampa, Florida, is urging citrus growers the United States over to join in the fight against citrus canker. It appeals for help on the ground that the canker is a problem too great for the states of Florida, Louisiana and Texas to handle and that it is a question of nationwide interest, for unless it is brought under control the citrus industry of the country is jeopardized. California has none of this trouble as yet but we believe citrus growers and all who value the welfare of the state are with Florida in this fight. To the end that widespread interest may be created in a liberal appropriation by the government to enable the department of agriculture to take up the fight, and that congressmen of this state may be informed, it is urged that Californians write to members of the agricultural committee and to our own congressmen.

D. C. Gillett, chairman of the committee, writes: "We must have this appropriation; we must impress our need upon the secretary of agriculture and also the agricultural committee of congress. We want to deluge them with a flood of bona fide letters from every friend of the citrus industry. We therefore request you to write in your own way 23 short letters, one to the secretary of agriculture at Washington, Hon. David F. Houston, and one to each member of the committee on agriculture, and one to Hon. Champ Clark, speaker of the house. You need not dwell on the method of eradication or on the amount required to accomplish this purpose. Simply present them with the fact that federal aid is the only power available to eradicate citrus canker from the United States of America, and ask them to vote in favor of an adequate appropriation to accomplish this purpose when the matter is presented to them for consideration."

The members of the agricultural committee may each be addressed, "House Office Building, Washington, D. C." They are: Honorable Asbury F. Lever, Gordon Lee, E. S. Candler, Jr., J. Thomas Heflin, John A. Maguire, Thomas L. Rubey, James Young, H. M. Jacoway, Ralph W. Moss, John V. Leshner, Michael K. Reilly, Benjamin I. Taylor, Dudley Doolittle, Gilbert N. Haugen, James C. McLaughlin, Hon. Willis C. Hawley, Joseph Howell, Henry T. Helgesen, Charles E. Patton, Sydney Anderson, J. Kuhio Kalaniana'ole.

In addition, the members of congress from California who may be addressed House of Representatives, Washington, D. C., are: Wm. Kent, John E. Baker, C. F. Curry, Julius Kahn, John I. Nolan, J. A. Elston, Denver S. Church, Everis A. Hayes, Charles H. Randall, W. D. Stephens, Wm. Kettner.

IF YOU HAVE A TRACTOR, YOU
SHOULD ALSO HAVE A

Knapp Engine Disc Plow

With this plow you can work within one foot of the trees in throwing the soil from the trees. Built very low, so that no part can come in contact with the limbs of the trees. Will penetrate hard soil and will not jump or swing around. Will turn under and completely cover up any cover crop or foul growth NO MATTER HOW HIGH OR HOW THICK.

WILL NOT CLOG UP IN PLOWING BURR CLOVER OR VETCH, as it has a wide clearance.

NO LEVERS to come in contact with limbs, as the land and furrow wheels are provided with worm-gear lifts, which does away with the levers and makes the plow easy to raise or lower.

TURNS EITHER TO RIGHT OR LEFT, and is steered by the engine as well as by hand.

The seat is in the center of the plow to keep the driver away from the trees, and all operating rods are within easy reach from the seat.

MADE IN ALL SIZES to suit every size and make of tractor.

For Big Fruit Profits Plant Foothill Grown Trees

Their well branched fibrous root system—well toughened bark and wood fibre—their freedom from root knot and diseases common to trees grown in other localities, make them more hardy and superior to trees grown on the river bottom and valley loam locations commonly chosen by nurserymen.

Look at What is Back of the Trees You Buy

Our trees are all pedigree-stock. We select our buds and scions from parent trees having the best record for productiveness and quality of fruit. Our trees give profitable service for a lifetime.

Make Your Selection Now and Order Early

There is sure to be a shortage in the best varieties this year. The demand is big and the supply light. Send us a list of what you want—do it now and you will get the pick of our stock and just the varieties you want at lower prices than you must pay later on.

Here Are Some of Our Specialties:

PRUNES

There is always a shortage of trees in French, Imperial, Robe de Sargent, Sugar and Standard on Myroblan root. These are the best selling varieties this year and there will again be a shortage. We have a fine block of trees on Myroblan root in each of the varieties.

CHERRIES

We have a good stock on both Mahaleb and Mazzard root, and can take care of your orders in any of the following: ROYAL ANNE, EARLY BURBANK, EARLY CHAPMAN, EARLY PURPLE GUIGNE, BLACK TARTARIAN, BING, LAMBERT AND BLACK OREGON.

WALNUTS

Our scions of Franquette and San Jose Mayette are cut by the premier walnut expert of the State, R. Wiltz of San Jose.

SHIPPING PLUMS

Every standard variety of Shipping Plums on Myroblan root, Bitter Almond and Peach root. Let us have a list of your wants for prices.

PEARS

We have a fine block of trees, well rooted and hardy, in Wilder, Lawson, Bartlett and all of the later standard fall varieties.

BARTLETT PEARS, as well as all of the standard Fall Pears, have this year made a good record for the California grower, as they do every year.

ALMONDS

We have a fine block of trees on Bitter Almond and Peach root.

APRICOTS

There is usually a shortage, particularly of Apricots on Myroblan root for planting on heavy loam or poorly drained locations. We have a fine block of Apricots on Myroblan root in all varieties, as well as on Apricot and Peach root.

OLIVES

We are offering a limited number of trees of Mission Olives worked on Picholine root.

CLINGSTONE PEACHES

OUR IMPROVED TUSCAN is preferable in every way to the common Tuscan in the following features:

- 1st—More regularly productive.
- 2nd—Perfectly round; uniform size and symmetry.
- 3rd—They do not split pit.
- 4th—They do not gum.
- 5th—They are fine grain, of superior canning quality and command a premium of from two to five dollars per ton over the ordinary Tuscan.

HAUSS CLING PEACHES

A seedling from Phillips Cling, and has all the desirable features of that splendid variety. Ripens immediately after the Tuscan, filling the interval between the Tuscan and Phillips.

PHILLIPS CLING PEACHES

Our Phillips Cling are of the true type and but one generation removed from the Phillips Cling first introduced. Very few are aware of the fact that the Phillips Cling, as commonly propagated, is deteriorating from the true type in the successive propagations.

Send Your List Now—Get Our Low Prices

We have complete assortment of all varieties of citruses and deciduous fruit trees and vines. Our catalog gives full description and explains advantages of our service.

METHODS OF HARVESTING CALIFORNIA WALNUTS

Written for California Cultivator
By J. G. Berneike

VERY season presents its own difficulties of harvesting. The three past seasons illustrate this, at least as applied to Orange County. In 1913 harvesting was difficult because of damage done by aphids and sunburn; in 1914 it was easy because the crop was light and we had no injurious influences. Almost every nut was good. In 1915 blight, sunburn and codling moth have given us the most difficult tasks of sorting out culls that perhaps we ever had.

The writer has a small orchard of ten-year-old trees, said to be grafted. The nuts from the different trees are, however, by no means uniform in type and it becomes necessary to select carefully those that conform to the standard of budded nuts and leave out those random sizes and shapes that would fall into the ordinary soft shell class. This necessity led to a change in the ordinary method of harvesting, and the experience derived therefrom prompts some suggestions for the benefit of walnut growers.

It might seem best to make these suggestions shortly before harvesting begins; on the other hand I write them down and present them while they are fresh in my mind from the harvesting experience just passed. If they are considered worth while the interested walnut grower will file this copy of the Cultivator for future reference and meanwhile will have time to consider carefully whether improvement in his own method is not desirable and practicable. The high standard which must in future be maintained for California walnuts, if shipped under a guaranteed brand, in order that prompt sales of the entire crop (which is constantly increasing) might readily be made, makes it absolutely necessary to find the best method of harvesting which will help the grower.

Beginning then with my own orchard: My crop as a whole did not reach the standard of budded nuts. Yet there were many trees that did. In order to get the advantage of the higher price for budded nuts, and not have too much difficulty in sorting, I must keep the crop from each tree by itself until sorted. This was done. A separate sack was used for each tree, and when emptied on to the walnut tray for drying and sorting, short boards were placed across to hold the crop from each tree separate. The sorter was a very intelligent woman who kept a sample of standard budded nuts before her and thus could easily draw the dividing line. More than was looked for was accomplished by this method of harvesting. The difficulty of sorting the walnuts to bring them up to the required standard for cracking test was greatly lightened. In the first place every walnut which showed a stain was thrown out, also every one with a hole in the shell or the stem end, and every one with hull sticking to the shell. But this sort of culling proved insufficient. It might suffice in some years, and did in 1914 when even a large per cent of the culls were good nuts.

To satisfy scientific curiosity the sorter opened many culls to note the relation of the outward signs to the condition of the kernel. She cracked many suspicious looking nuts that could not easily be taken for culls. And then she applied the cracking test to perfectly good looking nuts with most surprising results. The finding in brief was this: Many perfectly good looking nuts were culls. Many suspicious looking nuts on the other hand had fine kernels. After this the cracking test was applied to each separate lot as it was reached. And many a fine looking, good sized

lot was dumped into the off-grade or culls as a result of the test. As ordinarily handled these nuts would have gone into the merchantable class. Had this been done in this instance it would probably have so greatly lowered the cracking test applied at the walnut house that the entire crop would have been rejected. Resorting would have been impossible because not even the most expert handler of walnuts could have told any difference by outward appearance or weight of the nuts.

Culls caused by blight were easily picked out. Culls caused by the larvae of the codling moth were harder to find, excepting those which either showed a dark stain or a distinct hole in the stem end or shell. Some of these culls will escape the most expert sorter, even if every nut is individually handled. This is the nut which still holds the worm, while the nut with the large hole shows the worm has escaped.

Culls from sunburn were the hardest to recognize, and in fact it was impossible to recognize most of them. Our sunburn culls this year were different from those of other years. In other years they have been caused by burning the hull fast to the shell during one or perhaps two burning hot days. This year the injury came during the last rather hot week of August. The hull was black and thinned out on the sun exposed side but easily came off the shell, leaving a very slight stain, if any. The kernel was turned slightly amber on the burnt side but was not in the least shriveled. The weight of the nut seemed normal. At harvest time many of the kernels showed that a mold had started on them, and the nuts of many trees rejected by my sorter showed the same moldy condition without the slightest outward indication of it on the shell discoverable by the naked eye. While growers seem to agree in ascribing this condition to the hot week in August, yet we have so far received no scientific explanation for it.

This year's and past experience leads me to adopt this as my future plan of harvesting: Harvest the crop as promptly as possible. Pick up good and bad under each tree and keep the crop from each tree separate. Do no shucking in the orchard but let it be done in the walnut camp. Begin culling with the unshucked walnuts. A cracking test at this stage will show what nuts to throw out, whereas if shucked there might be nothing to indicate culls. In case of a large orchard I would send a man through the orchard, following the shaker, to make a cracking test under each tree and tag the tree. Pickers might then be assigned to pick up under tagged and untagged trees separately. Sacks may be tagged to correspond with tree tags showing cracking test. This plan may seem a little troublesome, but in the end will save time and money.

Having culled the unshucked nuts, all worthless culls may be burned up. This may help to destroy blight and the codling moth. The shucking can be done by hand or by a machine huller. Sometimes the dry huller and sometimes the wet huller will prove the best. The drying must be promptly and thoroughly done. To expose the nuts to the hot sun causes many "splits"; to expose them to the night fogs causes mold and slow drying. An air blast for drying would seem to be ideal, but I have not yet heard of any grower experimenting in that line. Exposure to the sun with very frequent stirring for one or two days would cause but little splitting, but the fog must be kept off at night. Molding of nuts on the drying trays would thus be largely prevented. In no case must they be piled thick and left without stirring.

I dry mine in a large barn loft which has ample openings for air, and spread them thinly at first. After shucking and drying they must be

culled and sorted once more to take out what escaped at first. Thereafter, to keep tab on the bearing of each tree and rule out robber trees, and also to discover if possible why the crop of one tree shows poor nuts and that of another tree shows good nuts, I expect to number all trees and provide numbered tags for each sack and keep a record of each tree's performance.

PROTECTION OF DRIED FRUIT

Recent investigations have shown that the loss to the dried fruit industry from the attacks of insects is sufficiently great to make it nearly as desirable to put up the fruit in sealed packages as it is in the case of cereals. No exact figures are available as to the extent of the loss because the injury is usually noticed for the first time by the retailer or consumer after the product has been widely distributed. The retailer is inclined to be reticent about the amount of damaged fruit in his possession, and unless the damage is considerable, prefers to stand the loss rather than return it to the wholesaler. The total damage however is unquestionably considerable.

The two insects that do most of the harm are the Indian meal moth and the dried fruit beetle. An investigation carried on in California by the department of agriculture has shown that the fruit may become infested with these insects in the field, in the packing house, in the warehouse and in the grocery store. Adequate protection against such infestation therefore must consist first in the sterilization of the fruit before it is packed, and secondly in the use of cartons through which the insect cannot penetrate.

Dried fruit is usually processed in some manner before being packed in order to make its appearance more attractive. Figs, for example, are frequently dipped in boiling brine, and this in itself is sufficient to destroy all insect life. Other fruits, such as the peach, are dipped in cold or lukewarm water. In such cases the addition of a belt heater is suggested as an effective means of destroying insects. By running fruit in a series of belts through a chamber, the temperature of which is maintained at 180 degrees Fahrenheit, satisfactory sterilization can be secured. By adjusting the speed of the belt the time that the fruit remains in the heater can of course be easily regulated. The heater should be so arranged that the fruit is delivered into a screened packing room, which will insure it against contamination before packing.

The greatest part of the infestation occurs after packing, and in consequence the sterilization of the cartons is of great importance. These should be sealed after having been filled, and before they are placed in the warehouses or cars. In this way the fruit is not only protected against infestation, but is preserved for long periods in the condition in which it was packed. Fiber board packages have been found satisfactory containers for the fruit, and sealing can be done in several ways. Machines have been invented, for example, which will rapidly seal small packages of dried fruit and at a moderate cost. One machine designed to wrap cartons 8x3x3 inches will wrap and seal a minimum of 10,000 a day at an estimated cost, including all material and the wages of the operator, of less than \$1.00 a thousand. When the output is increased to from 15,000 to 20,000 cartons a day, the cost will be from 80 to 90 cents a thousand. At this rate it is estimated that the machine will pay for itself in a comparatively short space of time and that the manufacturer will be able to deliver a sealed product which is practically safe from all danger of infestation. Further details in regard to this subject are contained in Bulletin No. 235 of the United States department of agriculture, "The Control of Dried Fruit Insects in California."

ARIZONA FARM BUREAU MEETINGS

Farm bureau meetings in Cochise and Santa Cruz Counties, Arizona, are announced by Adviser A. L. Paschall of San Simon as follows: Douglas, December 2; Bisbee, 2; Naco, 3; Garces,

3; Elgin, 4 and 6; Canille, 7; San Rafael, 8; Patagonia, 9; Sonoita, 11; St. David, 13, 14, 15; Benson, 16 and 17; Cochise, 18; Willcox, 18 and 20; McAlister, 21 and 22; San Simon, 24 and 27; Bowie to Willcox, 29; Willcox, 30 and 31.

With this announcement are sent out these thought provokers:

Farming to be successful must be done upon a community basis. There are great undeveloped agricultural resources in Cochise and Santa Cruz Counties. There are also excellent home markets.

Are you making a profit farming or are you playing a losing game?

Do you know how much it has cost you to produce your crops and which one has given you the best returns for the cash and labor invested?

Let's put farming upon a business basis and a community basis. Come to the meetings and let's plan together and decide on the best farming methods in your locality.

Do not fail to attend the farmers' short course, at the University, January 3-15, 1915. This will be worth much to you.

PRUNING DEMONSTRATIONS IN STANISLAUS

The Stanislaus County farm bureau will hold a series of pruning demonstrations under the direction of the farm adviser C. M. Conner, at the various local farm bureau centers, beginning December 9 and continuing until December 16. Two experts will be furnished by the university for this work; one to prune trees and another to prune vines. The demonstration will be held on ranches selected by committees of local farm bureau centers. As many different varieties of trees and vines will be pruned as opportunity offers. Demonstrations will be held according to the following schedule:

Claus, Thursday a. m., December 9; Riverbank, Thursday p. m., December 9; Oakdale, Friday, December 10; Empire, Saturday a. m., December 11; Modesto, Saturday p. m., December 11; Hughson, Monday a. m., December 13; Denair, Monday p. m., December 13; Wood Colony, Tuesday, December 14; Keyes, Wednesday a. m., December 15; Mountain View, Wednesday p. m., December 15; Paterson, Thursday, December 16.

At these demonstrations the pruner will illustrate his talk by actually pruning the trees, giving his reasons for making certain cuts and explaining how the young trees may be trained in order to obtain desired results.

WEST SIDE LANDS IN KINGS COUNTY

The Cultivator representative at Hanford writes: "The West Side lands of Kings County, 35 miles west of Lemoore, are now being cultivated. Over 20,000 acres of good land, which has lain barren for lack of water, is now growing fine crops of olives, alfalfa and beans. It is also suitable for rice culture.

"This vast empire is blooming like

Mr. Murray is Pleased at the Quantity of Water From His Well.

the rose in many spots, due to the energy of Hanford men who have confidence in the soil and propose some day to establish a thriving city eight and one-half miles from Huron and 30-odd miles west of Lemoore.

"The pioneers in this movement are David Murray of the Hanford Ice Company; C. M. Gifford, the olive king of

San Diego, who already has planted 160 acres of olives and will have bearing trees in three years; Superintendent of Kings County Schools J. E. Meadows, who has 25 acres in alfalfa, and the Ascolano Olive Company, which has 95 acres planted to olives. Mr. Meadows is farming 640 acres and has put in a well and pumping station that is pumping 500 to 600 gallons per minute.

"The Murray ranch has 20 acres now in olives and the fruit compares favorably with any grown in California. The Gifford large Mission olive is planted exclusively in this section. Mr. Murray has solved the water problem and his pumping plant is a model one. He is pumping seven and one-half second feet. The Nelson ranch in this district has grown a large acreage of beans and the owner will later go in for olives and 'cots. The prediction has freely been made by land experts that this West Side domain of Kings County is destined to be the olive grower's paradise. Wise nurserymen and packers, like the Giffords, have taken time by the forelock and will have an olive orchard that, will possibly be second to none in the state.

South America is buying Irish potatoes of California growers this year. Formerly these countries bought potatoes in Europe, but the war shutting off that source, they now turn to the United States.

The Lawn and

Flower Garden

THIS MONTH

SPRING blooming bulbs should be in the ground at once. Iris which has not been planted as yet should be put into the ground during December at least and be making root for sending up blossom stalks. Early blooming gladiolus should be planted and the dwarf, or nana type, which should have been planted a month or more ago, may still be put into the ground with reasonable assurance of fair results. Gladiolus, by the way, should be planted in succession, say two or three weeks apart, so as to secure blossoms during the entire summer. They may be planted as late as June. To hold bulbs that late, however, they must be kept in a cool, dry place.

Watsonias planted a few weeks ago and now up should be given an abundance of water. If largest and finest of blooms are desired a bit of commercial fertilizer will prove beneficial.

Dahlias which have been left in the ground should be taken up at once and stored in a cool, dry place for spring planting.

From "The Garden Beautiful" December calendar we quote: "The anemone, narcissus, or daffodil, single and double, in shades of orange, yellow and white, the Dutch hyacinth, tulip, Spanish iris, early and late flowering gladiolus, lily, Roman hyacinth, ixia, ranunculus, sparaxis, freesia, ornithogalum (Star of Bethlehem), cyclamen, montbretia and German iris should all be planted immediately."

This is planting time for roses and all shrubs. The tops are dormant, or will soon be with this cool weather, and they may be reset with bare roots providing the tops are well cut back. Cuttings may be made of roses during this month, also of lemon verbena and many other flowering shrubs. Another plant which grows readily from cuttings is the syringa which gives an abundance of beautiful white bloom in the later spring months.

But above all, this is the month for getting the soil ready for planting in the warmer spring months. Spade in the manure and wet thoroughly, then keep weeds hoed down during the cooler months. If the lawn has been given over largely to devil grass by this time it is turning brown. A sprinkling of nitrate of soda will help the blue grass to come through and make better appearance during the cooler months. Raking in of well-rotted stable manure is advisable at this time. The raking will discourage devil grass and give the blue grass a chance.

A few flowers of a kind, grouped loosely in a vase, make a much prettier bouquet than a large number crowded together. Do not put too many colors together; the effect is better with only one or two.

No home is complete without a flower and vegetable garden, no matter how small.

THE GLADIOLUS

The gladiolus is becoming more deservedly popular each year, its beautiful flowers of such wonderful lasting qualities placing it above many other cut flowers. By merely trimming a small portion of the stem away each day the same bouquet will last over a week. It may be had during a long blooming season by different plantings at intervals of two weeks.

This flower succeeds everywhere and responds so quickly to good treatment and requires so little effort that there can be no excuse for not producing good flowers. According to the varieties the bulbs will produce flowers in from 65 to 90 days. Well rotted stable manure is one of the best fertilizers and should be spread over the land in the fall and plowed the following spring. Plant from three to four inches deep, the larger bulbs the

Small Fruits

Vegetables

THIS MONTH

SPADE in the manure and get the beds ready for spring planting of beans, melons and others of the less hardy vegetables which should not be put in the ground for some time yet. In fact, a heavy mulch of stable manure, with occasional wetting to wash it into the soil, proves beneficial. But notwithstanding this is one of the

Hoes Set for Two Rows at Once

colder months there may be planted a number of the hardier plants, such as Broad Windsor beans, the chayote, which is becoming better known each year, kale, mustard and of course all of the hardy plants, carrots, cauliflower, cabbage, chard, endive, lettuce, onions, radish, spinach, etc.

This is a good month also for planting strawberries. In securing sets be sure that they come from plants which have not yet borne a crop of fruit. The producing of strawberry plants is an art in itself and care should be taken that they are not only from strong parents but from young stock as well.

Rhubarb, asparagus and horseradish should also be planted this month.

There are a few sections where hill-side locations give proper air drainage and there is little danger of January frost where it may be wise to plant potatoes. Of course one may be caught by the frost but if not the reward is large for such early stuff. Probably the best variety for planting at this season is the Early Rose.

If one has a few old sash or, still better, a regularly constructed hot bed, seed may be sown for tomatoes, chilis and others of the more tender plants. But even where the hot bed is used only the most favorable locations will stand for earliest planting of these young, tender plants. In the absence of the glass good results have at times been secured by the use of muslin.

DAMPING-OFF

This is largely a disease of seedlings common in greenhouses, but also found in gardens and fields. There are numerous damping-off fungi, all of which occur within the soil. They attack the young plant at the ground line, first causing a watery appearance of the stem. Ultimately the attacked tissue becomes so weak that the plant falls over. Subsequently the whole plant may be invaded by the fungus. The development of the damping-off fungi is favored by warmth and abundant moisture in soil and air. The crowding of plants may bring about the latter condition. Control consists of keeping the soil cool, reducing the amount of water applied, frequent stirring of surface layers to facilitate aeration, and the prevention of crowding the plants.—W. W. Robins, Colorado Agricultural College.

HINTS ON POTATO SEED SELECTION

Good seed is a determining factor in the production of maximum crops of potatoes.

Good seed may be obtained by the

Cultivating Between Rows,
12 to 14 Inches Apart

tuber-unit and hill-selection methods of selection through the elimination of unproductive and weak plants. These methods are explained in Farmers' Bulletin 533, "Good Seed Potatoes and How to Produce Them."

Like produces like. If tubers from unproductive or weak plants are used, a similar harvest will be reaped.

All tubers showing marked discoloration of the flesh should be rejected.

Purity of seed stock is an essential quality of good seed. Serious losses are sustained by the grower through mixtures.

From Holland to Your Home

The beauty and elegance of bulbous flowers fresh from your own gardens. Just think of splendid beds of Narcissus, Tulips, Crocus, Freesias, and many other pleasing varieties, yielding an abundance of bloom for your pleasure. An opportunity just once a year. TO THE PEACH GROWERS

I have recently been appointed by Governor Johnson, market director, to carry out the spirit and provisions of Assembly Bill No. 318, passed by the last session of the legislature, which calls upon the market director to do anything and everything that can be done to aid the farmer to get a living price for whatever he has to market, and the consumer to get his food products at the lowest price possible.

It is not difficult to see that this is a heroic task, and that no one man alone can hope to accomplish the desired ends. To attain the object in view it is imperative that the hands of the market director be upheld by the farmers of the state, and this they can do in no better way than by forming the strongest kind of organizations.

It can easily be understood how impossible it would be for a market director to deal individually with untold thousands of farmers scattered in all parts of the state, that his only hope lies in dealing with strong organizations.

My plea therefore is that farmers in every branch of farm production should organize, if only for marketing purposes, in order that the market director may be better enabled to succeed in the work undertaken.

I must make an especial appeal to the peach growers to organize, because their position at this time seems to be the worst among the farmers of the state. The market price for their

the proposed association and to give to it his earnest and hearty moral and financial support.—Harris Weinstock, Market Director.

INCREASE CONSUMPTION OF FRUIT

Continued from Page 531

And why? Because the buyers have confidence in this organization. They are satisfied that we have named a reasonable price at which they can sell our goods and make a reasonable profit for themselves, therefore they are not afraid to buy, as they know the price will not be lower tomorrow than it is today. We have maintained prices and that is one of the strongest points in marketing generally. I have been in business for 25 years, and my experience has been that on a declining market or unsettled conditions you cannot sell anything, for the buyers are afraid that tomorrow their neighbors will be able to buy for a little less.

Staple Market

I was East a few months ago and called the wholesalers together in several of the larger cities and asked them what they thought about our prices and they invariably said this: "We do not care what your prices are as long as you maintain them." That tells the tale. The wholesale men are in business for profit. They do not care for one-half cent or one-quarter cent, as long as they can make their profit and as long as the retailer is

MUCH NEEDED

Prof. L. H. Bailey, author of "Farm and Garden Rule-Book", many other valuable rural manuals, and editor of "Standard Encyclopedia of Horticulture", "Cyclopedia of American Agriculture" and the McMillan Rural Science Series, writes:

"Returning from an absence I find 'The Garden Beautiful in California'. I am very glad that you have put this account of your experience together and have made it available for people in California and elsewhere. It impressed me as being a book of practical value and much needed in the new and rapidly developing field of gardening in Southern California."

product is and has been and unless some radical step is taken, is likely to continue to be, below cost, which of course must mean ultimate ruin to them.

A group of public spirited citizens and peach growers, realizing the seriousness of the situation are giving without hope of reward other than the satisfaction that comes from rendering a public service, of their time, their means and their energies, to organize a California Peach Growers' Association. Their progress has not been as rapid as the end in view justifies.

In my investigations thus far of the peach situation I find that many growers hesitate to subscribe to the proposed organization, not because they do not keenly feel the need of organization; not because they do not realize that if the present situation becomes permanent ruin to the peach industry is inevitable; but because they hesitate to place the marketing of their crops for a period of perhaps seven years into the hands of seven directors at this time unknown. It is the fear that these seven unknown directors may not prove fit that restrains them from taking the only step which it is possible for them to take in order to save the peach industry of California from ruin. To meet and to overcome this fear, after consultation with Governor Johnson, it has been suggested that the trustees of the proposed association elect as one of the seven directors a state representative to be nominated by the market director, that this state representative sitting on the board of directors with a full voice in its management, shall keep the market director advised of the conduct of its affairs by filing with him copies of the minutes of the directors' meeting, and of any weak spots which may develop in the management of the association: That it shall then become the province of the market director to investigate the affairs of the association; if need be, to hold a hearing and make findings, and to give such findings the widest publicity, in this wise tending thoroughly to protect the absent stockholders. In the interest of the California peach growers, and in the interest of the welfare of the state, I strongly urge and recommend every peach grower in California to join

interested in selling these goods. The great trouble has been that raisins were considered a luxury and not a common article of food like sugar and flour, and the retail prices have often been prohibitive. We have been advertising that the consumer should be able to buy raisins at a certain price, and if he could not get them at that price, to let us know and we would see that he did get them.

Maintain Standard

I can see no stronger way to increase consumption than by organization at home. If you can manage to get your product under control you can eliminate the inferior part of that product. There are ways and means that it can be used. It would be better to feed it to hogs than to place it on the market. For instance, we have a few raisins left from last year which we could sell at a lower price, but we have refused and set them aside, and some day they can be used for mince meat and manufacturing purposes.

Help for Cooperators

I am much interested in cooperative work and am very glad to see that the governor appointed a commissioner to assist in improving marketing conditions. It is most vital and important to see that the farmer gets the most satisfactory return for his products, as he puts the money in circulation which makes good times for all. It will not help your marketing to go out on a big campaign for once. You have to work constantly and continually to keep the thing before the consuming public, and always try and improve the quality and educate them how to use the article you are marketing.

If at any time I can be of any assistance to you in organizing, or furnish you any information which we have obtained at the expense of both time and money, I will be very glad to offer my services, as our board of directors approve of my assistance wherever I can to spread the gospel of cooperative work.

In conclusion would strongly recommend organization so that you may control your own products. You can utilize the methods and means I have mentioned, and thereby increase your sales, which will automatically raise the price of your products.

Motorists! Cut Fuel Bills Save 25% to 50% on Gasoline

by using "Gomor," the scientific lubricant. "Gomor" is poured into ordinary gasoline and thus introduced into the motor through the carburetor with the gas. At every explosion "Gomor" is sprayed on cylinder walls, pistons, valves, etc., thus positively eliminating carbon formations. It greatly lessens friction, makes gasoline vaporize quicker and motor run perfectly on very lean mixture. One quart of "Gomor" is sufficient to treat 80 gallons of gasoline. Thus, if your gas tank holds 10 gallons, add one gill (1/4 pint) of "Gomor" when filling.

Positively Increases Mileage 25% to 50%

"Gomor" is a scientific lubricant, and is the invention of a well known Detroit chemist. It contains nothing injurious to motors—it is a great benefit to motors. Do not confuse "Gomor" with any of the ether, camphor or other harmful chemicals that are sometimes employed to temporarily increase speed.

"Gomor" is a high grade lubricant that withstands the heat generated in any gasoline motor. It keeps a thin film of oil on vital parts of the motor that are imperfectly lubricated or inaccessible to usual methods of lubrication. Thus friction is lessened and motor runs with more power. In this way, mileage per gallon of gasoline is increased 25% to 50%—a big saving you will appreciate.

Four Year Tests

"Gomor" is not an experiment. Upward of one thousand tests of "Gomor," covering a period of four years, have been made. These tests have been conducted by leading automobile engineers and have been most exacting. Many motor companies and thousands of private owners testify to the merits of "Gomor."

Saves Wear on Motor

Friction is the thief of power, and "Gomor" reduces friction to a minimum. "Gomor" saves wear and tear on motors and thereby greatly increases their life. Our exhaustive tests have proved this fact.

"Gomor" must do all we say—else we will refund your money

The Gomor Oil Company is a thoroughly responsible concern backed by a number of Detroit's leading business men. "Gomor" is widely used in the East, and is now being rapidly adopted by Western motorists.

"Gomor" sells for \$1.00 sample quart can, prepaid to your address. "Gomor" really cost you nothing, because it saves its cost many times over in reduced fuel bills. Order today or send for booklet, testimonials and sworn proofs.

"Fills a Long-Felt Want"

The Encyclopedia of Practical Horticulture

Recommended by growers from Massachusetts to California and old Oregon as the best in print for the practical grower. This is a complete, scientific, reliable, up-to-date work on every kind of crop production except grain, hay, cotton and tobacco. Covers the whole field of outdoor commercial horticulture for men with or without technical training. A mine of practical information on every phase from planting to market. Successful western methods given special attention. Four vols. 6064 pages, 750 splendid illustrations, 4500 subjects carefully indexed several ways, 164 pages of maps, charts, planting tables, statistics of production. Spray formulae, etc., etc. Diseases and pests the most complete ever printed in one work. Over 200 special contributors. Handsomely bound, clear type, good paper.

This is Worth Looking Into

Economics

on the Farm

WHEN TO INVEST

It takes courage fortified by confidence to enable farmers to make permanent improvements on their farms, buy sires and dams suitable for building up their flocks and herds and make investments in other things that increase efficiency and comfort in times of financial stress, yet sound business judgment generally requires that such investments be made.

Men who have accumulated fortunes in business and attained independent incomes from very obscure or modest beginnings are generally the men who have invested when times were dull and when they saw great opportunities. The fact that times were dull made the investments more valuable. Their neighbors were afraid, possibly, to invest when opportunities were afforded and these are generally the people who have been outstripped in the race for financial independence. The fact that one has little cash does not always mean that opportunities for investment in equipment should be ignored. There is a way, usually, for men of sound business judgment to finance their operations.

Expenses incurred in permanent improvements and in equipment for productive purposes should be considered as investments from which income will be received. If the investment pays only a small dividend each year for many years it may be profitable. The mistake of charging such expense to the income the first year should not be made. If the investment is judiciously made the cost is not an expense at all, but an investment to increase the income.

Every farmer must use his own judgment in buying equipment. But it is a fact that many of us are too conservative for our own good. We have been taught to fear debt, to buy nothing that we could do without and to "pay as you go." This may be sound for some, but it is a handicap to others. The farmer that has confidence in his farm and his ability to manage it profitably needs no restraint or advice in his investments. He is a master of his own affairs and is looking for investments in equipment, even in times of close financial affairs.—Texas Farm and Ranch.

TARIFF COMMISSION

We have a letter from Congressman Wm. D. Stephens of the Tenth district of this state in which he refers to bringing up at the coming session of congress the bill—or one very similar to it—introduced at the last session, which provided for the formation of an expert tariff commission. Congressman Stephens writes:

"I favor a protective tariff that shall equalize the cost of production at home and abroad, give a reasonable profit to the American producer, insure permanent employment to American labor at good wages, and restore prosperity to the business men of the nation. For many years I have advocated an expert tariff commission. Such a commission with right or power to recommend would take the tariff out of politics."

To give an idea of the scope of the former bill which will be the basis of the new bill to be introduced December 6 we may quote:

"That a commission is hereby created and established, to be known as the tariff commission, which shall be composed of seven commissioners, who shall be appointed by the president, by and with the advice and consent of the senate. Three commissioners shall be chosen from the district composed of the states of Maine, Vermont, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, Ohio, Indiana, Michigan and Wisconsin. Two commissioners shall be chosen from the district composed of the states of New Jersey, Delaware, Maryland, Virginia, West Virginia, North Carolina,

South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Arkansas, Tennessee, Kentucky, and the District of Columbia. Two commissioners shall be chosen from the district composed of the states of California, Oregon, Washington, Idaho, Nevada, Utah, Arizona, Montana, Wyoming, Colorado, New Mexico, North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, Texas, Minnesota, Iowa and Missouri."

The first commissioners are to be appointed for four, five, six, seven, eight, nine and ten years respectively, successors to be appointed from the districts in which commissioner's terms expire. Not more than four commissioners shall be members of the same political party. The commissioners shall give their time exclusively and may be removed for inefficiency, neglect or malfeasance in office.

"Whenever called upon by the president, either house of congress, the ways and means committee of the house of representatives, or the finance committee of the senate, the commission shall recommend such tariff legislation as in its opinion will accomplish the results specified in the call."

FARMERS' LEAGUE

At the annual meeting of the Farmers' Protective League of California, held in San Francisco the following officers and directors were elected for the ensuing year:

President, F. B. McKevitt, Sacramento; first vice president, L. F. Graham, San Jose; second vice president, C. C. Teague, Santa Paula; directors, Geo. H. Cutter, Sacramento; G. H. Hecke, Woodland; Kent S. Knowlton, Bakersfield; C. A. Bode-well, Jr., Petaluma; F. A. Hutton, Dixon; C. N. Hawkins, Hollister; B. F. Walton, Yuba City; secretary and manager, Arthur Dunn.

To the end that farming interests shall receive recognition at the hands of the legislature, the following resolution was adopted unanimously: "Moved, that the organization be pledged to use every honorable endeavor to secure the election to the legislature of men who are friendly to the agricultural interests of the state."

Among the measures to be worked for will be a bill creating a department of agriculture in California by consolidating about 14 existing departments and commissions at present performing similar duties in many instances. Such a bill, urged by successive fruit growers' conventions, was introduced at the last session of the legislature, but politicians declared openly that it would not pass because "too many jobs were involved." The bill was lost on committee files.

Although defeated at the last amendment election, another rural credits amendment will be advocated and efforts made to educate the electorate residing in cities as to the purpose of the measure. All efforts of organized labor to foist a universal eight-hour law on California will be opposed vigorously.

Organization of league branches is going on in several counties. Some of the branches are saving money for their membership by purchasing commodities at wholesale rates.

Forty states of the Union have taken some legal action toward safeguarding the sanitation of public school buildings, according to a bulletin on "Schoolhouse Sanitation," just issued by the bureau of education of the United States department of the interior. "Probably nine-tenths of the existing regulation of this sort has come within the past decade," declares the bulletin. "Each state profits by the experience of 47 others. A law passed in one extreme of the country today is copied next month or next year by a state 2000 or 3000 miles distant."

General Agriculture

RED SPIDER ON HOPS

WILLIAM B. PARKER of the United States department of agriculture at one time made an 18 months' investigation of the red spider, *Tetranychus bimaculatus* Harvey, on hops of the Sacramento Valley, which he reported in Bulletin 117 of the bureau of entomology. Regarding the life history and control measures, he says: **Life History**

The eggs are deposited singly and loosely amongst the webs and upon the underside of the leaves. From ten to 450 may be found on a single leaf. The period of incubation varies from four and one-half to ten days according to the state of the weather, and the period of maturity from eight to 16 days. Sexual differentiation takes place after the second moult, but copulation does not take place until after the third. Parthenogenesis has been observed to take place, the bulk of such offspring being males.

The mites live on the underside of the leaves, protected by their webs, and gradually migrate from the lower leaves as they become damaged to the higher portions of the vines. They do not hibernate on their hosts, but upon violets, mallow, *Malva passiflora* and morning glory *Ipomaea*.

Experiments showed that the average female mite can travel over 211 feet of leaf surface in ten hours and from ten to 60 feet over soil according to the texture. The writer has observed this mite to be almost omnivorous with regard to its host plants, and gives a list of 43 greenhouse and ornamental plants, 41 field plants, shrubs and trees, and 19 herbaceous plants occurring near hop-fields, all of which this mite has been found to attack. From the wide range of plants in this list it seems probable that this pest is able to thrive on any form of vegetation in which the pubescence of the underside of the leaves is not so heavy or luxuriant as to prevent direct attack on the leaf tissue.

The first symptoms of the attack are the appearance of yellow spots on the leaves. As the mites increase in number the leaves become more "speckled," turn yellowish, dry up and fall to the ground. The decrease in the vitality of the vine results in a premature ripening of the hop cones, decreased yield, and weakening of the roots. The male vines appear to suffer more severely than the female and are sometimes entirely defoliated.

Several insects have been observed preying upon the red spiders, but not in sufficient number to have much effect on the infestation. The most numerous insect was a small anthorid bug, *Triphleps tristicolor*, White. Certain small ladybirds have also been observed.

For preventive measure the writer has found that the cheapest and most convenient insecticide is flour paste, 8-100, or a combination of lime-sulphur 36 degrees Baume, 1-100, and flour paste, 4-100. It is essential that the vines be thoroughly sprayed. These mites are not affected by any form of dry sulphur. Stripping the vines and burning the leaves is an excellent measure, but not reliable as a complete control. When the mites have reached above the point of stripping, spraying operations should be commenced immediately after stripping. A second spraying is also necessary seven or ten days later.

The cost per acre of spraying the different liquids with a machine of two acres per day capacity works out as follows: Stripping the vines, \$1.95 to \$2.19; spraying twice, each 300 gallons, with flour paste (8 per cent), \$7.80; spraying twice, each 500 gallons, \$8.27; spraying twice, each 300 gallons, with mixture of lime sulphur (10 per cent) and flour paste (4 per cent), \$8.03; spraying twice with same mixture, using 500 gallons, \$9.

Experiments with flour paste, 8½ to ten per cent, show that it is very ef-

fective in fixing the mites to the leaves, but as it has no effect on the eggs a second application is necessary. It is also quite harmless to the foliage and blossoms and does not interfere with the fertilization of the cones.

It is useful against all attacks of red spider except on sweet peas, carnations, greenhouse roses and plants having a heavy pubescence on the leaves.

The leaves of carnations and greenhouse roses are too smooth for the flour paste to adhere and the old method of washing with the garden hose remains the best method in this case.

MET AT ELSINORE

The last meeting of the Riverside County chamber of commerce was held at Elsinore where, in addition to a fine duck dinner, a launch ride on the lake and an automobile ride over the valley, much business was transacted which will prove of considerable advantage to producers of Riverside County, and perhaps to producers of California.

One feature discussed was pure seed legislation. A committee consisting of Messrs. Warmington, Stalder, Dudley, Willis and Edom was appointed to push this matter of the legislature protecting seed buyers.

Another matter of discussion was the installing of a school of poultry husbandry at Riverside in June of next year. At least it will be installed if there is sufficient encouragement and the chamber of commerce has pledged its hearty support.

Francis Cuttle presented the matter of the Newlands-Broussard River Regulation bill. A committee was appointed to work for this measure.

The next meeting of the organization will be at Blythe in the Palo Verde Valley near the Colorado River.

COMMERCE REPORTS

We have letter from E. E. Pratt, chief of the bureau of foreign and domestic commerce, department of commerce, Washington, in which he calls attention to the value to the American people generally, and of course exporters primarily, of the daily commerce reports which furnish information as to producing and manufacturing activities in other countries and also opportunities for introducing American goods. Reports are given in this publication from every corner of the world. These daily reports are sent for the nominal sum of \$2.50 per year. Address communications to Superintendent of Documents, Washington, D. C. Postage stamps not received.

SELLING CALIFORNIA PRODUCTS

Jay Dutter, formerly of Hemet and connected with the California Growers' Association, is on his way East to induce Eastern consumers to consider the merits of California fruits put up by California cooperative packers. This cooperative association is extending its activities almost every week. There are now canneries at Tulare, Kingsburg and Woodlake and there probably will soon be others at Hemet, Ontario and Chino. The plan to be followed by these concerns is to make up mixed cars of various California products and ship to the small Eastern markets. Mr. Dutter's work is to induce a trial of this plan of marketing and he will sell directly to the consumers or get as near to them as possible.

WALNUT CULTURE IN ARIZONA

Walnut growers who may have similar conditions to those in Arizona will be greatly interested in Bulletin No. 76 of the agricultural experiment station at Tucson. It is a small pamphlet but full of information as to cultural conditions in semi-arid sections.

Save Labor on Your Farm This Winter

For less than half the cost of keeping an extra hand you can have your cows milked, your cream separated, and practically all your chores done by a

G-E ELECTRIC MOTOR FOR RANCH AND FARM

G-E motors will also drive irrigation or house pumps, circular saws, wood splitters, ensilage and feed cutters, corn shellers and many other farm machines besides household labor saving devices such as washing machines, food choppers, dish washers and the like.

A G-E motor is easy to operate, does not get out of order, and costs but a trifle to run. A G-E motor pays for itself many times over through savings in time, labor and wages.

geles, California, as Second-Class Matter.**Thursday, Dec. 2, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**SHOP EARLY**Remember, the Cultivator
makes a most delightful Christmas
present, with 52 reminders during the
coming year of the Christmas thought.
Also keep in mind the Cultivator's dol-
lar series of books, "Poultry for
Profit" and "The Garden Beautiful".**SAFETY FIRST**The farmers of the cotton belt
are being urged to change their style
of farming and diversify. Heretofore
it has been on the "40 acres and a
mule" basis with the entire 40 in cot-
ton and the mule often desperately
hungry. It is now proposed—and is
being carried out in many sections—
that the cotton producer become the
producer of butter, eggs, a little corn,
a "few punkins", and other products
which will do well in the various sec-
tions of the South. This means en-
riched lands and farmers who will not
starve one year out of three.**DOLLAR, NO LESS**Kansas wheat growers are unit-
ing to demand one dollar as the mini-
mum price for their wheat. The first
principle of this organization is "To
fix a minimum price for wheat based
upon the average cost of production,
estimated to be at least one dollar a
bushel, and enforce it through con-
certed non-delivery."Maybe the first principle of the or-
ganization will operate before the one
fundamental principle of all market-
ing, and that is the fixation of price
by supply and demand. Of course we
realize that if this organization can
hold its members together and make
the non-delivery of wheat general, the
supply will be in a measure controlled,
but controlling the wheat market of
the world is a different proposition.**MILLION A DAY**It is said that the movies in this
country are costing the people in ex-
cess of a million dollars a day. If it
could be brought about that instead of
the slap-stick clown films there could
be something educational offered, the
public schools of the country would be
compelled to put forth their best
efforts not to be surpassed as an edu-
cational force. But as it is there is
a wonderful opportunity for improve-
ment in the films. One who has seen
some of the more educational of the
moving pictures shown at the
P. P. I. E. then seen the slush that
is thrown on the screens in some of
the cheaper theaters is inspired by a
desire to see something better given to
the people. We would not take the
ground that all our amusement should
be of the "high brow" type, for we
all need fun to soften the rough spots
of life. But much of the material
used on the films is in neither of these
classes.**SANITARY DAIRYING**The National Dairy Union, an
organization of allied dairy interests,would visit the state this year good
roads over which to drive their
machines. There are none of us who
have not heard our Eastern friends
remark in most glowing terms on our
road system. There are still many
places of great beauty inaccessible be-
cause of no roads. More, there are
sections where economic demands
should impel us to build more and
better. Now comes San Diego with a
proposition to make 1916 even better
than was 1915. Her citizens and those
in many other sections of Southern
California are working for a continu-
ance for another year of that most
beautiful of all expositions. Los An-
geles has united with San Diego and
it is now assured that funds will be
raised to finance the project. With
Europe still closed, why should not
California reap the benefit of the great
numbers of people who have visited us
during 1915. They have taken back
much of praise for conditions in this
state. Let us not disappoint those
who shall come as a result of their re-
ports. Nothing succeeds like good
roads. Let us have more of them.**EXPOSITION**The Panama-Pacific Interna-
tional Exposition closes next Saturday
at midnight. It has accomplished**HOW WE GET ADVERTISING**We have many solicitors or canvassers whose duty it is to get us
advertising, but first to investigate as thoroughly as possible
and know that the article to be advertised is all right and the
business methods of the firm strictly honest. We do this to
protect our readers.Sometimes we get fooled, but we do our best to be sure that every
man or firm mentioned in this paper is reliable. Then our solicitor goes
to the firm and asks for the advertising patronage. We tell them that
the California Cultivator has so many thousand readers, that these
readers are prosperous, intelligent farmers who are likely to buy these
particular goods if they are advertised in the California Cultivator,
because our subscribers read this paper carefully each week and have
confidence in what they see advertised in our columns.We tell this business man that we are trying to make the California
Cultivator very helpful and very welcome in the best homes of California
where he should be able to make good customers.We tell them that we accept nothing but high class, reliable adver-
tising so that we guarantee our readers will be treated fairly.We tell them that our readers are greatly interested in the California
Cultivator and want to see it prosper and for that reason they are glad
to give their patronage to the merchants who help support the California
Cultivator by advertising in it. Then we tell him what it will cost.That is one reason we ask your earnest support in reading our adver-
tising columns and buying of these merchants whenever possible.is objecting to the publicity which has
been given to the campaign for more
sanitary dairies and creameries. It
does not deny that there has been
occasion for such a campaign, though
unsanitary conditions have been found
only in exceptional cases, but from
the publicity given through the press
and the courts a feeling has gone out
that unsanitary dairies are largely
maintained throughout the country.
This has materially affected the con-
sumption of dairy products.In the main we believe there is no
more clean or healthful food than that
sent out from our dairies. If the
officials whose duty it is to enforce
the law could secure enforcement
without so much publicity we believe
it would be better for all concerned.
The claim is made that the publicity
amounts to a warning to the neg-
ligent. But in giving warning to the
negligent it is not necessary, at least
we feel that it is not, to frighten peo-
ple away from the business of careful,
painstaking dairymen.**GOOD ROADS FOR 1916**For the past five years we have
been looking forward to 1915 as the
great year in California. It has come
and nearly gone and has indeed been
a great year. In one particular we
were urged to make preparation, and
that was to give to the tourists whomuch for California in a commercial
way; it has accomplished more as an
educational factor; and it will be
many years before this influence ends.
The people of San Francisco, of Cali-
fornia and of the entire country may
well be proud of this great achieve-
ment. In its architecture, its exhibits,
its congresses, its embodiment of
world progress in the peaceful arts, we
believe the verdict of the world will
be that the Panama-Pacific Inter-
national Exposition marks the great-
est epoch for world betterment. To
describe its beauties or to estimate in
any way its effect is impossible, but
President Moore of the Exposition
has asked the Cultivator for "a brief
sentiment that will symbolize our
idea of what the Panama-Pacific In-
ternational Exposition has accom-
plished or will accomplish for human
betterment and world progress."In answer to this request the Cul-
tivator has sent the following:The Panama-Pacific International
Exposition has accomplished much
for human betterment through the in-
spiration which it has given to agri-
culturists to produce better and make
their calling—what it always should
have been—the very highest and
best. From the live stock pavilions,
from the great agricultural palace,
from every building on the grounds,
and from the horticultural beauties
at every turn have gone forth in-
fluences which will not only be of im-
mediate benefit to our own Pacific
Coast but will aid in an agricultural
uplift in all countries, and agricul-
tural uplift means uplift of social life
and of the arts and sciences.**Agricultural Notes**The wheat yield of Denmark for the
crop season just closed is twice last
season's.Canada now has three transconti-
nental lines connecting the Atlantic
and Pacific coasts.A forestry and water supply commis-
sion has for the first time been ap-
pointed in Venezuela.Canadian turkeys were shipped to
England last fall for the first time,
and more are expected to go this sea-
son.The raisin crop in the Malaga dis-
trict of Spain is somewhat short of
average production and is decidedly
backward.The government of Colombia, South
America, has sent two special agents
to this country to study our agricul-
tural and commercial institutions.Cotton heads the list of farm pro-
ducts exported from the United
States with an average annual value
for the last five years of \$550,000,000.
Packing house products are second
with an average of \$155,000,000, grain
and grain products following with
\$150,000,000 and forest products are
fourth with \$100,000,000.Para, Brazil, will celebrate the
300th anniversary of its founding by
a great exposition to open January 1,
1916. The agricultural section will
make a special feature of the develop-
ment and progress of the corn indus-
try and our consul at Para has been
appealed to to secure a large show-
ing of American varieties.The present need for enormous
quantities of hospital supplies in
Europe has directed attention to
many articles that heretofore have
been put to little use in surgery. The
common bog or sphagnum moss has
been discovered to be even more sat-
isfactory as a dressing than cotton. It
is more springy and diffuses matter
absorbed to a greater extent.Cooperative farm implement so-
cieties have been established in many
of the poorer districts of Ireland.
Implements are purchased and hired
out to members in the order in
which applications for them are made
but precedence is given to the mem-
ber who wishes to use the implement
for the longest period. The rate at
which implements are hired out to
members of a society is about half
what it would cost to carry out the
various operations under the old
regime. If, for instance, potato sort-
ing by hand costs 15s per ton, the
potato-sorter is hired out at 7s 6d per
ton.A farmers' cold storage plant sub-
sidized by the government has re-
cently been completed at Morrisburg,
Ontario, a town of about 1900 inhabi-
tants in a dairy farming community.
The purpose is to afford producers
the opportunity of storing when the
market is low instead of being at the
mercy of the large cold storage con-
cerns. Some of the average rates are
as follows: Butter, per 100 pounds:
Two weeks, eight cents; one month,
14 cents; six weeks, 22 cents; suc-
ceeding months, 12 cents. Eggs, per
30-dozen case: One month, ten cents;
season, 40 cents. Meats, per pound,
chilled: First month, one-fourth cent;
succeeding month, one-eighth cent;
per pound frozen, first month, three-
eighths cent; succeeding months,
one-eighth cent. Vegetables, per bag:
First month, seven cents. Per barrel:
First month, 12 cents; succeeding
months, ten cents.

Agricultural News Notes

of the Pacific Coast

Northern California

Esparto, Yolo County, is planning incorporation.

The Acampo Nursery reports dull market for peaches but a brisk one for almonds.

Citizens of Eldorado County are opposing the consolidation of Eldorado and Tahoe national forests.

W. V. Shear of the department of agriculture is investigating potato conditions in Humboldt County.

The university farm management is highly elated at the winnings on fat steers made at the Panama-Pacific.

A meeting was held at Lakeport, Lake County, last Saturday to discuss the matter of a county water district.

Yolo County expects the planting of between 11,000 and 15,000 acres of rice in the western part of the county.

Colusa County swine breeders have employed a veterinarian to look after the health of the hogs of the members.

Entries are already being made for exhibits at the state poultry show to be held in Sacramento, December 14-18.

Rice growers of the Sacramento Valley are planning a persistent fight against weeds and other pests of the rice field.

The farm bureau center at Jacinto, Glenn County, has taken an abandoned school house and fitted it up for meetings of the center.

Eastern visitors to the Panama-Pacific poultry show made a visit to Petaluma and were surprised at the showing of large poultry plants.

Property owners of Thermalito, Butte County, are perfecting plans for the Thermalito irrigation district which will cover about 5000 acres.

The Cheney slough irrigation district near Colusa is being discussed. It will cover 4200 acres or more, that number having already signed up.

The Sutter and Yuba County boards of supervisors will probably send the exhibit of those counties at the Panama-Pacific Exposition to San Diego.

The Orland irrigation project has been materially improved by lining some of the main canals with concrete to the extent of 153,000 square yards.

Orange growers and shippers of Butte County are insisting on highly colored sweet fruit. As a result shipments are not so forward as last year same date.

Experiments have been made by orchardists in Sutter County in the planting of Chinese seedling peach trees which are said to do well in alkali sections.

A committee has been appointed by the Sacramento Valley Development Association to organize a fight against the water grass pest, which is proving a serious menace to the rice fields.

H. L. Murphy writes that his shipment of pure bred Shorthorns has all been sold to White and Terry of Sacramento County and Fred Hammel of Yolo County, and that he is now starting for the East for another shipment of pure bred.

Central California

Porterville is shipping oranges to San Salvador.

San Joaquin is the latest to become interested in rice production.

Pumpkin packing is in full swing at the Selma, Fresno County, cannery.

The first Central California oranges reached San Francisco November 17.

F. E. Robertson is president of the farm bureau of Denair, Stanislaus County.

California shipped more than 13,000,000 pounds of raisins during the first eight months of 1915.

Grain producers of the San Joaquin and Sacramento Valleys are considering shipping grain in bulk.

C. Z. Herbert of Monterey County, has a young boar from the Ed E. Johnson Duroc herd of Turlock.

Oliver Bardin and Frank Chisholm, both of Monterey County, have new importations of Curtis' Napa Reds.

The vintage in the San Joaquin Valley is practically over; only about 25 per cent of the juice has been fortified.

The Chowchilla chamber of commerce is discussing ways and means of improving irrigation conditions of their section of Madera County.

During the past summer nearly 3000 hogs have been inoculated with anti hog cholera serum in San Joaquin County and the treatment has been declared a success.

Enough money has been secured to insure the organization of the California Peach Growers' Protective Association. Definite figures are not yet in but sign-up day resulted in at least \$25,000 being subscribed.

More than one-third of the cows of a large dairy near Modesto recently died because of alfalfa bloat. The trouble was caused by a defective fence that permitted the stock to break into a field of lush young alfalfa.

The Associated's effort to secure general observation of raisin week by retailers the country over was most successful. In Chicago 225 leading grocers cooperated and made special features during the entire week of November 1-6. Of course Sun-Maid was foremost in the display.

Merced County farmers are elated over the judgment of \$425,800 against the San Joaquin and Kings River Canal Irrigation Company, a Miller and Lux holding. The riparian rights of the farmers had been set aside by the irrigation company. It has required 15 years' continuous litigation to secure this decision.

There is to be a series of swine breeders' meetings held in Tulare County which will be of especial interest. There will be instruction in feeding, hog cholera and its control, with demonstration of treatment and other features of interest. Dates of the meetings are: Visalia, December 13; Tulare, December 14; Waukena, December 15; Porterville, December 16; Poplar, December 17, and Dinuba, December 18.

Southern California

Redlands is to have another orange packing house.

Imperial Valley ginned 6765 bales of cotton last year.

Calexico anticipates the establishment of a cotton seed oil mill.

The Hemet-San Jacinto Growers' Association is busy processing olives.

Saticoy, Ventura County, has shipped in excess of 1000 tons of walnuts.

Orange County anticipates in excess of \$4,000,000 from its next year's orange crop.

Imperial creameries are pleased at higher prices for butter than a year ago this date.

Southern California potato growers are pleased at the present upward tendency of prices.

Orange growers of the southern part of the state are anticipating much better prices than during last year.

The Anaheim Citrus Fruit Association recently held its annual meeting at which nearly all its 350 members were present.

The earliest oranges in the southern part of the state were marketed from the Colorado desert section of Imperial County.

Imperial Valley cotton plantations have been made the scene of moving pictures to illustrate methods of California farming.

Frampton Brothers of Artesia, Los Angeles County, produced from 9.64 acres 330 tons of ensilage at a cost of about \$1.05 in the silo.

Hundreds of cases of eggs and many cans of frozen eggs unfit for market have been destroyed by officials of the state board of health.

The large administration building on the state school farm at Whittier, built many years ago, is being razed because of its unsafe condition.

The Cuyamaca ranch of 22,000 acres has been sold and it is asserted water will be developed and a place of beauty and productiveness made.

Ventura County bean growers are getting busy and perfecting an organization which they hope will be in condition to handle the lima bean crop of 1916.

The Sierra Madre, Los Angeles County, Citrus Association recently held its annual meeting and elected M. M. Hamilton, president and W. I. Allen, secretary.

Ten thousand acres of northern Imperial Valley lands have been secured by a large corporation and extensive improvements will be made in that section of the valley.

The Claremont Pomological Club, one of the best horticultural societies in Southern California, has elected Chas. E. Needham, president; Mrs. Olds, treasurer, and V. V. Leroy, secretary.

The agricultural assembly movement is becoming general all over the Imperial Valley, and it is now asserted there will be a representative of every school district in the county at the first meeting to be held at Brawley.

The Coast

Arizona has organized a state board of trade.

Oregon's Chinese egg law has been declared constitutional.

Yuma, Arizona, was visited by a slight earthquake last week.

Idaho's wheat crop is larger by 3,000,000 bushels than ever before.

The quarantine against Mexican cattle in Arizona is still maintained.

Paul V. Morris is the new state leader of county agricultural agents of Oregon.

Lane County, Oregon, is building more silos this year than any preceding year.

Arizona will maintain an exhibit at the San Diego exposition during the year 1916.

Potato growers of Yakima Valley, Washington, are holding firmly for \$14 and \$15 per ton.

Utah beet sugar farmers lost heavily because of earlier than expected hard freezes.

Chandler, Salt River, Arizona, is fattening 3000 head of feeders shipped from Minnesota.

The Pacific International Live Stock Exposition opens at North Portland, Oregon, next Monday.

The American National Live Stock Association will hold its next meeting at El Paso, Texas, January 25-27.

One trapper in Idaho recently caught 150 head of coyotes in one month, on which he received a bounty of \$2.50 each.

One of the largest sheep deals consummated in Montana for years was the sale of 12,045 head, commanding nearly \$65,000.

Farmers of Twisp, Washington, have largely discontinued summer fallowing, preferring crop rotation and diversified farming.

Heavy snowfalls have driven the sheep from the ranges of Utah and sheepmen are having trouble in finding sufficient pasturage.

The people of Yuma recently celebrated the piping of water to the Mesa Irrigation District. Hundreds of acres will be given opportunity for intensive irrigation.

The Pecos Valley of New Mexico recently held its state live stock and products exposition which was so successful that a \$4000 deficit from last year was wiped out.

The total apple production of the Pacific Northwest is estimated at 13,238,000 boxes. Washington produced 7,092,000; Oregon, 3,402,000; Idaho, 1,708,000; Montana, 1,036,000. It requires three boxes of apples to make one barrel as quoted in the East.

The Northwest By-Products Board, which was appointed sometime ago, reports that as the indications are that there will be an exceptionally large yield of all fruits in 1916 there must be preparation for handling of the waste products of the orchard. A meeting was held in connection with the National Apple Show at Spokane, Saturday, November 20.

There is no good reason why you should wait till next spring before getting a
DE LAVAL

IF YOU ARE SELLING cream or making butter and have no separator or are using an inferior machine, you are wasting cream every day you delay the purchase of a De Laval.

THERE CAN ONLY BE TWO real reasons for putting off buying a De Laval; either you do not really appreciate how great your loss in dollars and cents actually is or else you do not believe the De Laval Cream Separator will make the savings claimed for it.

IN EITHER CASE THERE IS one conclusive answer: "Let the local De Laval agent set up a

machine for you on your place and SEE FOR YOURSELF what the De Laval will do."

YOU HAVE NOTHING TO risk and more than a million other cow owners who have made this test have found they had much to gain.

YOU CAN'T AFFORD TO WAIT till next spring. Let the De Laval start saving cream for you RIGHT NOW and it will earn its cost by spring.

SEE THE NEAREST DE LAVAL agent at ONCE or if you do not know him write us direct for any desired information.

Live Stock and Dairy

CALIFORNIA LIVE STOCK BREEDERS

Written for the California Cultivator
By Special Live Stock Contributor

GRICULTURAL authorities of national and international reputation who have visited the international exposition at San Francisco during the year have paid many high compliments to the character and caliber of the men engaged in the breeding of pure bred live stock in this state.

These broad-minded and critical observers who have visited us see a great future for our live stock industry because of this and the fact that we have feed and climatic conditions peculiarly adapted to successful stock growing.

The opportunity is here and we have the factors necessary for success. The

who would breed and sell any kind of an animal that has a pedigree, instead of maintaining high standards of usefulness, progress would be slow, but so long as registered animals are better individuals of their kind than grades and scrubs and are able to transmit their good qualities to their offspring, there is a sound economic reason for their existence and propagation at satisfactory prices to those engaged in the business.

It is possible for an unscrupulous breeder to do great injury to the industry. When he sends out an inferior animal that is a disappointment to the purchaser or where there is a question about the correctness of a pedigree or difficulty in securing it, buyers are apt to distrust not only this man but all other breeders. And this kind of bad advertising travels about a neighborhood with much greater rap-

MODEL DAIRY BARNS

One of the best appointed dairies in California is that of Mr. Sam F. Rhoads, near Lathrop. Mr. Rhoads believes in greatest comfort for the stock which serves him so faithfully. He also believes in maintaining sanitary conditions which will enable him to put out a product that will be attractive to the most fastidious customer.

The picture above gives one view of his model milking barn, showing particularly his method of milking with one of the latest and best milking ap-

pliances. The air pipe, or rather the vacuum pipe, extends along the entire length of the barn, as may be noted above the heads of the cows. Perfect sanitation of floors and gutters is maintained by flushing out at regular intervals. Note there is no possibility of dust or insects dropping from above. The ceiling makes the room as attractive as the ceiling of an ordinary farm home.

At present Mr. Rhoads' stock is largely of grades but these will be replaced as rapidly as possible with pure bred Guernseys.

further development of a great industry is in the hands of the big men now breeding live stock and those who are engaging in the business.

California has produced many pure bred animals of superior excellence, and we now boast of many herds, studs and flocks of national reputation.

What we need is many more of them. Not only should we have more herds to supply the increasing demand for foundation stock for new herds of pure bred animals to those already established, but there should be available pure bred rams of high quality for the grade flocks, dairy bulls capable of increasing butter fat production in their offspring for the grade dairy herds, pure bred beef bulls that will sire better beef animals for the ranges and farms, registered boars that will beget more economical pork producing pigs and more good stallions to sire more and better horses.

The success of any industry depends on the men engaged in it. If the majority of California breeders were men

idity than news about a satisfactory transaction and a good individual.

The organization and growth of our state organizations of breeders, such as the Draft Horse Breeders' Association, the Swine Breeders' Association, the Holstein, Jersey and other organizations formed for the purpose of conserving the interests of those breeding the various breeds and classes of stock, is a big factor in maintaining the high standard of excellence necessary in the conduct of the pure bred live stock business. Publicity helps the man who is producing superior individuals and who deals squarely. It is of no benefit to have it known among all interested in a particular breed that any certain one engaged in it cannot be relied upon and that inferior stock is being bred or handled.

We know that we have splendid men and animals and opportunities in California and it is good to have others recognize it—it should be a spur to greater effort and higher accomplishment.

When writing advertisers, mention The Cultivator.

LOUDEN

STALLS and STANCHIONS

The Clean-Cut Simplicity of Louden Stalls and Stanchions in design and construction; their absolute freedom from dirt-gathering cracks, crevices, corners or attachments, make them the only really sanitary barn equipment.

The Superior Flexibility of the Louden Stanchion permits the cow to lie down or rise without the dangerous straining common to the more rigid type. The Louden Stanchion (all steel or wood-lined) is an absolutely safe and comfortable stanchion.

Louden Stalls and Stanchions are built of the finest, high-carbon tubular steel and are exceptionally strong, easily installed and cost no more than wood.

We also manufacture Feed and Litter Carriers, Spring-Balanced Mangers and Manger Partitions, Bird-proof Barn Door Hangers, Hay Tools, Power Hoists; Calf, Bull, Cow and Pig Pens, Window Ventilators, Etc.

Write us for Free Illustrated Catalogs. We can plan your barn. Our experts will give you FREE sketches. Write us.

made and tested under the most rigid U. S. Government supervision; sold at reasonable prices. It's a business proposition. You're buying protection. Write, or telephone **Thatcher Serum Co., Riverside, Cal. J. L. Thatcher.**

WORMY HOGS UNPROFITABLE

No hog can eat enough to nourish its own body and at the same time feed a host of worms. Most of the food which a wormy hog eats goes to the worms along its intestinal tract. For that reason wormy hogs are unprofitable. Development is so delayed that the gains, if there are any, will not be sufficient to pay for the feed consumed. Furthermore, wormy hogs are so weakened that they easily become susceptible to other diseases. A pig is much more apt to take cholera if it is weak than if it is thrifty.

An unthrifty pig with a good appetite is pretty sure to have worms. Something is wrong with any animal which eats well but does not grow or fatten. In troubles other than worms the animal usually loses its appetite. Other symptoms are loss of the sleek coat; the hair becomes rough and stands on end; the pig develops a big paunch and may be tucked up. Examination of the feces will show worms and worm eggs. These become more numerous upon administration of a purgative.

Dr. A. H. Logan, United States veterinary field agent, who is stationed at the University of Florida experiment station, offers the following prescription for worms in hogs: Santonin, eight grains; areca nut, two drams; calomel, one grain; sodium bicarbonate, 1 dram. This dose is sufficient for a pig of 100 pounds. It is best to give this by mixing it with thin moist feed. If a large number of hogs are to be dosed, mix the prescription in the foregoing proportions for each 100 pounds live weight. Separate the hogs into lots of 15 or 20 so that each will have free access to the trough and will be able to get its share.

Worms may be kept from hogs which are free of them by keeping the following mixture where the hogs can get it: ground charcoal, one and one-half bushels; common salt, four pounds; hard wood ashes, ten pounds; slaked lime, four pounds. This mixture is cheap and will keep the hogs in good condition. Keep it in a dry place where they can come to it at will.

BUTCHERING NOTES

Butcher hogs at home. Give them water but no feed for a day before killing.

Bleed the hog with an eight-inch straight-bladed knife.

Be sure bleeding is done before scalding or the skin may be left too red.

A heavy blow with an axe between the eyes will stun the animal before sticking.

The meat may spoil if the animal is excited before killing or the weather is warm afterwards.

Scrape as quickly and rapidly as possible after scalding. The cold carcass is hard to scrape well.

Bleeding will be finished more quickly if the animal lies on a steep slope with its head down hill.

Keep the hog moving in the barrel. If the animal is left pressed against the barrel the hot water cannot get at that part of the carcass.

Scraping is easier if a shovelful of hardwood ashes, a lump of lime, some concentrated lye, or a handful of soft soap has been added to the water.

Use a thermometer. Do not attempt to scald with the water at above 150 degrees. A good scald can be obtained at 140 degrees but it takes longer.

In opening the carcass split the pelvic bone between the hams with a knife by cutting exactly in the center. To open the breast bone with a knife cut a little to one side of the center, but do not let the point of the knife get behind a rib.

These methods are used at the Missouri college of agriculture where students are taught the principles and practice of home butchering and curing. There is nothing to prevent the farmer from having the best without the extravagance of big store bills for salt pork. Both he and the storekeeper will profit if he cures meat for his own table and uses the money saved to buy things he would not otherwise get.

Remco Redwood Pipe Tanks

We build to order, for any capacity, TANKS FROM CLEAR AIR-DRIED REDWOOD—THE WOOD EVER-LASTING.

Our tanks are built to exact measurement by the most skilled mechanics.

THEY ARE GUARANTEED ACCURATE IN EVERY PARTICULAR.

Built for All Purposes

They are cheaper than metal tanks and outlast several of them.

WE ALSO BUILD TANK TOWERS.

Remco Redwood Pipe

Is scientifically designed and perfect in manufacture. The smooth interior gives greater carrying capacity.

Design and workmanship give strength.

Redwood gives length of life.

Suitable for Irrigation, Power, Water Supply and Drainage or Sewage Disposal.

Redwood Manufacturers Company

1604 Hobart Building, San Francisco

An Hour Longer in the Fields

DON'T knock off so early for milking. Install an Empire Mechanical Milker. Keep your team, yourself and your men in the fields working an hour longer. It means real money, especially on busy days when the grain has just got to be taken care of. The

EMPIRE MECHANICAL MILKER

saves time, labor, expense and eliminates all the drudgery of milking. It increases the milk flow—means purer milk—bigger profits. One double or two-cow unit will milk 20 to 30 cows an hour. One man can take care of two double units. Cows stand content for the Empire. The natural air pressure teat massage is firm and gentle.

Let us send you description and pictures of Empire Milkers and Empire Cream Separators that are making good in many fine dairies. Ask also for our offer on the Empire Gasoline Engines and Empire Star Feed Mills. Ask for Catalog No. 44.

The Reason The Result

LARROWE'S DRIED BEET PULP

is clean,
wholesome,
appetizing and
aids digestion;

will produce more
milk at less cost
than any other feed.

"—at no time did we ever handle any feed that gave better satisfaction or met with such general favor as Larrowe's Dried Beet Pulp, and we are very glad for having pushed it as hard as we have.

(Signed)

Oregon Commission Co.
Oregon City, Ore."

Your Cows Need This rich, succulent feed, in order to do their best

Dealers everywhere are selling it rapidly, because it "delivers the goods." It makes no difference what ration you may be using—you can add Larrowe's Dried Beet Pulp to it and get better results. This has been proven by large and small feeders everywhere. As it costs almost nothing to make the test, we suggest that you go to your feed dealer today and order a 100-lb. sack (either plain or with molasses) and try it on one cow whose milk record you know. The results will surprise you.

FIELD NOTES

By C. A. Briggs

Modesto, the land of alfalfa, of fine cattle and contented farmers, has many show places, but none of greater interest than the farm of M. M. Holdridge, the home of the celebrated Creamcup herd. From this herd can be selected dozens of individuals that would be winners in the show ring or on official test. They have been bred for type, size, persistent milking qualities and the production of a high percentage of butter fat. That the breeding has been successful is shown by the records made. Ten places have been won by this herd in the official prize list of the Holstein-Friesian Association of America. One cow, Tula De Kol Pietertje Netherland, leads the

but grown on land that was summer fallowed the previous year, and a cover crop grown and turned under in the spring, it produced 13½ tons per acre. The rainfall for 1913-14 was 28 inches, and for 1914-15 it was 20 inches.

The milo cut for grain was on two fields. In field No. 12 in 1914 a crop of barley was taken off. It was plowed January 1 and replowed April 13, 1915. This field produced 4020 pounds of grain per acre without any irrigation.

An orchard plot under the conditions mentioned above produced 5491 pounds of grain. The following method of cultivation was used: The land was plowed as early in the spring as possible; kept cultivated and clean until all the rains were over; sown

Tula De Kol Pietertje Netherland, of the Creamcup Herd.

list of the farm's prize takers with 33.82 pounds of butter in seven days, which makes her the champion cow of California. She also holds twelfth place in the entire United States, competing against a class of nearly 12,000 cows. Another of these Creamcup cows holds the eighteenth place in the United States with a record of 33.52 pounds of butter in seven days. A record recently made and never before published is that of Anselogess of Sleepy Hollow of 896.2 pounds of butter in one year. The herd sire, Creamcup Pontiac Burke, is a noble specimen of the breed and a worthy one as is amply proven by the records of his daughters.

The McHenry Poultry Farms, Modesto, has just added a 4000-egg Cyphers Mammoth incubator to their plant. They have besides six 2400-egg Cyphers. The proprietor, R. A. McHenry, says the demand for baby chicks keeps them all busy turning out the McHenry strain of White Leghorns.

A new silo under construction on the farm of E. O. McClure of Modesto is one of the exclamation marks of progress. Mr. McClure has a small herd of registered Holsteins of exceptional quality. Five cows are now on yearly test.

H. L. Murphy of Perkins, Sacramento County, is in the East on a buying expedition. He plans to bring back 50 or more Shorthorn cattle for his own herd and other Sacramento Valley breeders.

DWARF MILO

Dwarf milo has been proved a highly successful crop in the university's experiments with sorghums at the university farm.

As a silage crop milo equalled Indian corn in tonnage, and as a grain crop it exceeded anything grown under field conditions at the university farm at Davis this year.

The average production at the university farm in 1915 of dwarf milo for silage was 11.27 tons per acre from 6.05 acres, and of grain it was 5175 pounds per acre from 12½ acres.

The milo cut for silage came from two different fields. In field No. 4 with one irrigation of 6 inches of water it produced 9.73 tons per acre. In an orchard plot with no irrigation

IMPORTANCE OF MINERALS FOR HOGS

Written for California Cultivator
By W. S. Guilford

One thing that is overlooked on many ranches where hogs are kept is a supply of mineral matter for the hogs. The hog is very much like the human animal in many ways, and this is particularly true in regard to its needs for materials required for the building of the various organs and parts of the body.

A comparatively large amount of mineral matter is needed for making the bones of an animal. Some of this is contained in all of the grains and other foods, but in addition to this it is found that the animal does better, and that stronger bones are made when this mineral matter is supplied in some form aside from the feed.

Many of the best hog raisers in America keep a supply of minerals before the hogs at all times. Sometimes the various ingredients are mixed together and placed in a trough, and they are frequently put in bins in self-feeders—so that the hog may be the judge of the kind and amount.

The minerals used are lime (either air slacked or ground limestone), ashes (wood or coal or both), charcoal, salt, ground phosphate rock, and frequently small quantities of sulphur and copperas. The copperas can be ground or dissolved in water and sprinkled over the other ingredients.

Mr. J. W. Clise, Ayrshire breeder of Seattle, Washington, reports sales to California breeders during the dairy exhibit at the Panama-Pacific Exposition: J. Henry Meyer, two prize winning heifers; Howard Estate, two young bulls; LeBaron Estate Company, one bull and two heifers to which high awards were given; E. B. McFarland, second prize two-year-old bull, four cows and a heifer, several of the cows being from the winning "aged herd"; D. C. Cormode, two heifers, one of which was first; A. Bloom, an exceptionally bred young Robin Hood bull.

Poultry for Profit

CHICKENS IN THE BACK YARD

Written for California Cultivator
By Jean A. Koethen

THE pitfall into which the backyard poultry keeper most readily falls is that of keeping too many chickens. If a dozen hens fed on table scraps return a neat profit, two dozen are surely better, and 50 better yet. And so the yard is filled, hens are crowded in their houses and growing chicks in their runs. Result, stunted young stock, a tired out and disgusted caretaker and no more eggs, most likely than the 12 well-cared-for, comfortable hens would have produced.

I shall never forget the spring I tried to raise 300 chicks on the back of a 50-foot lot. I had read glowing stories of the number of hens a 50-foot lot would hold and the great profits derived from a flock of 100 in such quarters, and had to take my try at it. "No one ever does that but once", said an observing neighbor who had doubtless had her own experience, and I never tried it again. Baby chicks are such tiny creatures. A thousand or so would rattle around in the smallest backyard. But wait. That baby chick that weighs only a few ounces now will reach five, eight or ten pounds in six months. What will you do then with 100, or 500 or even 200?

Well, that spring I hatched perhaps 250. I had set my aim at 300 because that would give me the 100 pullets I was ambitious to raise for winter layers, but by the time the 250th was out of the shell I realized what I was up against. Had they been in lots of 100 each, the situation would not have been so serious, but I had used a 50-egg incubator and some hens, so I had broods of from ten to 40 chicks in Philo coops or following hens about, and my yard, which had seemed of unlimited capacity, suddenly became very small. I could hardly put my foot down without stepping on a chick, and as the older ones came to require more and more room, conditions became worse and worse. Mites, of course, soon found their way into the overcrowded coops, and many of the older chicks dropped off by twos and threes. As soon as they were good frying size I got rid of all but the very best pullets, but at a loss, and that summer's experience has served me as a solemn warning against overcrowding.

It is a mistake to figure that because 12 hens are kept at a profit of \$2.00 or \$2.50 apiece, 50 will be equally profitable. Small flocks are always more profitable than larger ones, that is the average production is higher. Table scraps figure largely in this average. There is no better feed for chickens than good, clean table scraps. This is the very best of balanced ration, and the cheapest. As soon as the number of hens increases to a point where table scraps become a negligible part of the ration, that minute cost of production begins to rise.

The question of green feed is another that must always be considered in planning for a back yard flock. Hens must have greens in one form or another. Where ground for raising green feed is limited, as it is in a city lot, the number of hens must be limited. Sprouted grains may answer as a substitute for a time, and lettuce from the Japanese and Chinese gardeners help out as a stop-gap in late summer, but the one is expensive and the other troublesome and sooner or later we fall back on the chard and kale and cabbage of the home garden.

Nothing is so satisfactory in maintaining the supply of chicken green as a little patch of alfalfa. Few back yards are so small that a corner 20 feet square cannot be set apart for this purpose. Planted in January it furnishes a green run for the baby chicks in May, and if it is well water-

ed and the larger birds are not allowed on it, it will supply green cut alfalfa for a small flock through the summer. Next to alfalfa kale furnishes more green feed for the amount of space it fills than any other plant.

What breed is best for the back yard? Not the Leghorn, nor any Mediterranean breed, though I know some people do keep them successfully. They are hard to keep where you want them and do not furnish the table poultry most families desire. Among the heavy breeds there is a large choice. No one can go amiss who chooses the Rhode Island Red, Wyandotte or Plymouth Rock. If he wishes something less common, there are the Houdan and the Faverolles, both reputed excellent layers and fine table fowls, and the Light Brahma, not always a satisfactory egg producer, but second to none for the table. Many back yard poultry keepers think there is nothing like the Minorca, though it is hardly a table bird and the Cornish Game has a host of admirers. I must confess myself to a desire to try the Dominique, the best known ancestor of the Barred Rock. It disappeared from public view for a while, but is coming back into favor in certain quarters and is well spoken of as a dual purpose fowl.

Whatever breed is selected choose that one and no other and do not be persuaded into filling your runs with a conglomeration of all sizes and colors. Such a mixture is not a pretty sight and there is absolutely nothing to be said for it. A pen of well kept, standard bred fowls of any single breed is a beautiful sight. A mixture of red and white and black and yellow is neither beautiful nor useful. It is proper, of course, if one is dissatisfied with his chosen breed to try out another, but let the two be kept separate and one be disposed of as soon as the test is concluded.

The great trouble with mixing breeds is that you never get anywhere. Unless pens are covered and the greatest care employed, there is sure to be some crossing, and the work of years in building up a breed is undone by one outcross. The first hybrid generation may be good layers, though they are rarely better than the parents, but the second nearly always goes to pieces. Experts know how to introduce a cross in such a way that the good qualities of the outcross are added and nothing taken from the good qualities of the original breed, but such experiments are for experts only.

A suitable house for a back yard flock is the shed-roof, open-front building so common in California. It should face the south and should contain about three square feet of floor space for each Leghorn or four for each fowl of the heavy breeds. A house ten feet square furnishes ample roosting space for 25 birds, and this is as many as should be kept in any city back yard. The house should be high enough for the attendant to stand up in, say five and one-half feet at the rear and seven feet in front. Some provision must be made for a covered scratching pen, and this may be done either by using dropping boards and letting the fowls run underneath, or by adding a scratching room to the house. Many hens do without this luxury, but shelter from winter rains is a great factor in egg production. Hens that must sit in their roost to keep out of the rain or else wander about, wet and bedraggled, are in no condition to do their best, and it ought not to be expected of them.

The back yard flock, well fed, well housed, and confined by a tight fence so that it can neither scratch up its owner's garden nor visit his neighbor's flower beds, is a joy forever. I know of nothing that gives a family more pleasure or more satisfaction. A dozen good hens will keep the table

supplied with fresh eggs and a toothsome fryer now and then.

Every Sunday, cold or hot
He'd a pullet in the pot.

is a catchy little rhyme that in the mind of its writer described the comfortable condition of a certain French peasant, and thousands of American families, town families, that 20 years ago hardly knew the taste of chicken or of a fresh egg are now, thanks to the development of back yard poultry culture, enjoying those luxuries. The number of fowls kept in cities has increased tremendously in the last ten years. This is one reason, perhaps, for the lower prices of eggs, but it means cheaper living for town families and better living. It means saving the kitchen waste that would otherwise be either an expense or a menace to the health of the community. It is another interest to keep the boys and girls off the street, and a fad for the man of affairs. By all means let us have chickens in the back yard, but let us not have too many.

PRODUCTIVE POULTRY HUSBANDRY

"Productive Poultry Husbandry", a complete textbook dealing with the principles and practices involved in the management of poultry, by Harry R. Lewis, B.S., of the New Jersey agricultural experiment station, published by J. B. Lippincott Company, Philadelphia, at \$2.00 net. The Cultivator will be glad to supply the book at the above price or, including a year's subscription to the Cultivator, \$2.75.

This is one of the most complete poultry books we have seen, with 536 pages of descriptive and illustrated text. As a reason for being we quote the first two paragraphs from its preface.

"The exceedingly large and ever-increasing demand for poultry and poultry products, at home and for export, has caused the poultry business to become so profitable, when conducted upon a scientific basis, that no breeder can afford to lack the latest knowledge of best methods in all its branches.

"A number of poultry books have appeared during the past few years in response to an insistent demand, some dealing with special branches, others covering the entire subject in a general way. But the great need in poultry literature is for a work which covers the subject in a thoroughly scientific yet practical manner, treating each branch in sufficient detail to give entire clarity and giving to the reader the results of research at the various experiment stations and the methods that are most successful in present-day practice."

This is the nearest to a complete treatise we have seen of the poultry industry and it has big value for the practical poultryman. There are 28 chapters with appendix and index. The subjects range all the way from the meaning of poultry farming, choosing of a poultry farm, making a successful start, different breeds of poultry, down the line to fattening and marketing, keeping records, exhibiting and judging, diseases, parasites and enemies.

TRY IN MINCE PIE

"This bread is kind of heavy," remarked Mr. Younghubby as he gingerly handled Mrs. Younghubby's first homemade loaf.

"Yes," replied Mrs. Younghubby, "but it won't give you indigestion, dear. I put two dyspepsia tablets in the dough before I baked it."

ADVICE

The thrifty army you should join,
Resist all pleasure's cravings;
And then some friend who needs the coin
Will borrow all your savings.

FARM LANDS FOR SALE

Farm Lands—20 Years to Pay. Fertile farms in Western Canada offered by Canadian Pacific Railway Company. Productive soil; good climate; ready markets; fine churches and schools; unexcelled transportation; all conveniences and opportunities of best farming districts anywhere. Prices \$11 to \$30 an acre; irrigated land from \$35. Loan of \$2000 to assist practical farmers in irrigated districts. Twenty years to pay—or sooner at your option. Long before your final payment is due your farm will have paid for itself. Also some improved farms with houses, barns, wells, fencing, and crops now growing on them on the same favorable terms. Interest in all cases only 6%. This offer is based on good land; we offer these terms because we know a farmer on our lands can "be successful"; he can live well and save enough to pay for his farm. Western Canada lands are naturally suited to growing grains, fodders, vegetables, dairying and raising horses, cattle, sheep, swine, poultry. Cash in on the high grain prices. Don't delay; the best lands will be taken first. Write today for free handbook and full information to J. S. Dennis, Assistant to the President, Department of Natural Resources, CANADIAN PACIFIC RAILWAY, Calgary, Alberta, Canada.

Carlsbad Irrigated Farm Land—Bordering ocean; on state paved highway and Santa Fe Ry.; 80 miles south of Los Angeles; government records show Carlsbad warmest in winter, coolest in summer of any spot in Cal.; deep sandy loam, model water system; low rates; lemons mature in summer when price is highest; immense profits in fruits and berries adaptable to coast territory; winter vegetables without competition; minimum temperature 1914 was 41 degrees; tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre; easy purchase terms. South Coast Land Co., G. Buxton, Sales Agt., Carlsbad, Cal.

FARMERS WANTED
VICTORIA, AUSTRALIA, offers special inducements. Government land, water, railways, free schools, 3 1/4 years to pay for farms adapted to alfalfa, corn, sugar beets, fruit, etc. Climate like California. Ample markets. Reduced passages for approved settlers. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal. Box X.

One Hundred Acres \$75 Per Acre Rice Land, Best in State for Sale—In a locality where rice is being grown now profitably. This soil is suitable for grain and alfalfa; in a section of Kings County which stands preeminent in farming circles for large crops. Write for particulars or call. Large or small tracts on easy terms. Hanford Real Estate Co., Hanford, Cal.

LIVE STOCK

Big Type Poland Chinas—I have an extra good lot of strictly high class young boars from three months to one year old that are fit to head any herd anywhere. Visitors say they are the best they have seen. They have the large size, the good hams and shoulders, the strong arched backs, great length and depth of body, plenty of smoothness, mellowness and quality—in fact, they have two good ends and a good middle, are good lookers and money makers. Their dams are either from Illinois, Iowa or Missouri, or they are from dams whose sire or dam are from these states. These boars are sired by Iowa Wonder who will weigh over 1000 pounds in show condition. He is a son of A WONDER, the greatest Poland China boar living or dead. These young boars carry the stamp of their sire and will sire pigs that will please you. Satisfaction guaranteed in every particular. I am overstocked. I have boars galore. I will sell them at extremely low bargain prices. No females for sale at present. The book on "THE HOG SUPREME—THE POLAND CHINA" will be sent to you free for the asking.

Yours for the BIG TYPE—the kind that grow faster and larger and have more pigs. Geo. A. Smith, Corcoran, Cal.

Billiken Herd of O. I. C. Swine—The big white kind. Early maturing, weight carrying; everything immunized against cholera by the simultaneous treatment. Pigs of both sexes from March, April, May and June farrows. Sires Chief again, Iowa Boy, Missouri Lad and Woodview Earl. Dams are all of the big, smooth type and very prolific. A few bred sows about ready for their second and third litters. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

Rancho Rubius Herd Durocs won first under six months; Junior Champion; Reserve Grand Champion; Champion Sow bred by exhibitor, second sow under two years, and other premiums at P. P. I. E. A few bred gilts and service boars for sale. Place your orders now for weanling pigs. Elmer Lamb, Ceres, Cal.

Del Dayo Farm (Old Haggin Bottom Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding, BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

Wanted—Man with bunch of cows to take charge of my 70-acre alfalfa dairy near Corona on cash or share basis. Might take other property for interest. Herbert F. Clark, 443 Wesley Roberts Bldg., Los Angeles.

Blue Ribbon Herd Duroc-Jersey Hogs, service Boars and Bred Gilts a specialty; also boar and two sows, not related. Meet me in S. F., 1915, prices. John P. Daggs, Modesto, California.

Six Young Duroc-Jersey Registered Boars for sale; sired by Col. Climax. He is a grand Eastern importation. Prices reasonable; immediate delivery. F. E. WHITE, R. D. 2, Hanford, Cal.

For Sale or Trade for stock cattle a first class imported Belgian Draft Stallion. For particulars address R. D. Box 73, Lindsay, Cal.

For Sale—Yearling Jersey bull, sire Silver Marcus; dam, Helen of Valley View. M. E. KER, R. D., Box 145, Modesto, Cal.

For Sale—Thoroughbred Duroc-Jersey Sows and Gilts, at reasonable prices. Healthy, first class stock. F. T. Harris, El Centro, Cal.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Registered Berkshire Weanlings, both sexes, \$10; subject to inspection. Cash on delivery. J. M. Bomberger, Modesto, Cal.

Milch Goats—For sale a few grade Toggenburg does, coming fresh; also some spring kids. E. W. Pritchett, R. F. D. No. 1, Box 389, Long Beach, Cal.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Navato, Cal.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Calif.

Registered Thoroughbred Berkshires of all ages; Cholera Immune; large boned. Ricconi Bros., Mountain View, Cal.

Registered Shires—Blackhawk Stock Ranch. Importers and Breeders. Easton & Ward, Burlingame, Cal.

W. J. Hanna, Reaoks Ranch, Gilroy—Large type Poland Chinas; bred gilts. Service boars.

Poland Chinas—Young Stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

SEEDS AND PLANTS

Strawberry Plants of the following varieties: Gold Dollar (extra early, fine, our leader.) New Oregon, "Morse," and the famous Etterburs No. 80, and No. 112, price 75c (postpaid) per 100, \$3.50 per 1000. Foreman Bros., Corning, Cal.

Poultry, Hogs and Cattle Fodder Cost reduced one half by planting and feeding our (Sworn Pedigree) Luther Burbank Cactus Plants. \$50 per 1000; \$10 per 100. Free instructive cactus literature with feeding results. El Campo Co., 227 Story Bldg., Los Angeles.

Alfalfa Seed—New crop. You want the best. We grow it. We sell it. You buy it. Write or wire for quotations, samples and information. V. A. PETERSON ALFALFA SEED COMPANY, ARBUCKLE, CAL.

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs, \$8.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

For Sale—First class re-cleaned alfalfa seed that has been inspected in the field by the Horticultural Commissioner, and is free from noxious weeds. Also choice Peruvian seed. O. C. Nordahl, Bard, Cal.

Strawberry Plants—Guaranteed pure bred Marshall, Gold Dollar, Klondyke, Early Ozark, Wilson, Magoon, Clark's, \$2.50 per 1000. J. W. Vinacke, Canby, Oregon.

Thoroughbred Strawberry Plants—Early Ozark, Gold Dollars, Wm. Belt, Goodells, Kellogg Prize, Marshalls, Magoons, \$2.50 per thousand. Mr. John Christiansen, R. F. D. 2, Canby, Oregon.

Eucalyptus Tree Seed—Eucalyptus, Acacia, and other tree, shrub and farm seed. Wholesale prices. George H. Hopkins, Eagle Rock, Cal.

Rhubarb Plants—We have some choice plants to offer in large or small lots. Get our prices. Currier Bulb Co., Seabright Cal.

Swiss Chard Seed, 1915 grown, 50c per pound prepaid; 42c by express. Cedarhurst Ranches, R. D. No. 2, Sacramento.

Strawberry Plants, 85 varieties, including the Fall-Bearers. Catalog free. L. G. Tingle, Box 144, Pittsville, Md.

Peruvian Alfalfa Seed—Hairy varieties, also Algerian wheat. S. P. Huss, Yuma, Arizona.

BEES

Instruction Books and Prices, Bees, Supplies, Etc., Free. Spencer Apiaries, Ventura, Cal.

TREES

Tribble Nurseries, Elk Grove, Cal.—Grafted walnuts and grafted paper-shell pecans. Exclusive propagators of Tribble Mayette, Kerr Parlatone, Gladys and Improved Franquette, 19 other walnut varieties. Fine stock of almonds, prunes, Bartlett pear on resistant roots and other fruit trees and plants. New list ready.

For Sale or Exchange—2500 Placencia Perfection Walnuts; 4000 olives, San Bernardino County delivery; Valencia lemons, grapefruit, all citrus trees; will trade citrus stock for clear vacant land, or equities that carry themselves. O. E. Van Slyke, 916 Story Bldg., Los Angeles, Cal., or Azusa, Cal.

Chase Walnut Trees, grafted on black walnut root. First-class stock. They will make you money. Write for circular and price. Also seedling trees grown from the original CHASE tree. Magnolia Nursery, Whittier, Cal.

For Acacias, Avocados, Budded Loguats, Citrus trees, Evergreens, Feijoas, Palms, Roses and all kinds of trees, shrubs, vines, etc. Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

Walnut Trees—Eureka and El Monte varieties a specialty; also Franquette and Placencia. Write for prices and description of stock. Personal inspection invited. Eureka Walnut Nursery, Montebello, Cal.

Fig Trees. 25,000 two-year-old trees from 2 to 6 ft. high. Seventeen varieties. Write for price list. C. C. Terbush, R. F. D. 2, San Gabriel, Cal.

For Sale—Fancy apricot trees raised in Hemet Valley. Wholesale prices. Write L. Kendall, 151 S. Meredith Ave., Pasadena, Cal.

Peach, Plum and Apricots, fine, thrifty trees; none better; low prices. Write Dr. F. M. Jenkins, 1498 Arrowhead Ave., San Bernardino, Cal.

For Sale—Mission Olives, Burbank Lemons, Seedless Grapefruit. One mile north of Exeter, Cal. Frank K. Asano, Box 376, Exeter, Cal.

Nurserymen—Pot grown conifers, palms, shrubs and ferns for lining out or potting. Ballou's Nursery, Pasadena, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

Budded Avocados—All varieties. Write for descriptive catalogue. Newbery Sherlock, R. F. D. No. 2, Pasadena, Cal.

Prune Trees 12c, Walnuts 30c. Cash Nursery, Sebastopol, Cal.

TURKEYS

Mammoth Bronze Turkeys—Early eggs for hatching now ready. Some birds for sale reasonable. Hillside Ranch, R. F. D. 11, Box 579, Los Angeles.

Bourbon Red and White Holland Turkeys, Pearl Guineas and Toulouse Geese. E. A. McKinley, R. F. D., Ukiah, Cal.

RABBITS

Richey's New Zealand Red Rabbits won again at Riverside Fair, 3 medals and 3 ribbons. Beautiful B. Rock Cockerels for sale \$5.00 each, from Blue Ribbon stock. MRS. C. A. RICHEY, R. 8, Box 557, LOS ANGELES. Send 25c for booklet "Making a Living on an Acre" and "Care of Rabbits."

Caldwell's Royal Red New Zealand scored and sold on merit. Catalog free. Caldwell Bros., Box 613R, Los Angeles.

A JOKE ON THE ANGEL

That was a good joke we played on the angel who gave Adam and Eve and their descendants work as a punishment; we have turned the curse into the jolliest kind of a blessing. I would almost say that work is the greatest thing in the world. Love may be greater, but love has its tortures as well as its joys and love may vanish from our lives. But while work remains nearly every sorrow can be forgotten, every grief in time can be healed. It is what keeps us all sane. It is a tremendous moral agent. We shake our heads sadly over the man who has brought up his sons without work. Will Comfort in the Craftsman says: "Give a man his work and you may watch at your leisure the clean-up of his morals and manners. Those who are best loved by the angels, receive no thrones, but a task."

And life has been worth while if we have been able to turn every trouble, every grief, every disappointment, inside out and find the compensating spiritual good in it. I guess that is another of the things we are here for.

A GOOD INDIAN'S PRAYER

"O Powers that be, make me sufficient to my own occasions. Teach me to know and to observe the rules of the game. Give to me to mind my own business at all times and to lose no opportunity of holding my tongue. When it is appointed for me to suffer, let me, so far as humanly be possible, take example from the dear, well-bred beasts and go away quietly to bear my suffering by myself. Help me to win, if win I may, but (and this, O Powers, especially) if I may not win, make me a good loser. Amen."

We do not come to church to be told that we are withered leaves and crawling worms, but to be assured that we are men, made only a little lower than the angels, and heirs of everlasting life.—Robert Collyer.

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Grafting Carob

I have a male carob tree. If I graft on some female branches will the whole tree bear fruit or only the female branches? Would you graft a few of the branches in the center of the tree? What month is best to graft?—Subscriber, Pasadena.

We will ask our subscribers to give their experience. Of course only the grafts which bear pistillate flowers would give fruit. Presumably only a very small portion of the male tree need be left to supply pollen to flowers on the grafted branches.

Grafting Guavas

I would like to graft or bud a strawberry guava to a yellow guava. Can any of your grafters help me out by giving their experience?—Subscriber, Pasadena.

We have never heard of efforts to graft the guava but we will be glad to hear from subscribers.

Pruning Almonds

How should two-year-old almond trees be pruned? Should they just be thinned out or is it best that the tops be cut off? They were cut back last year to three sprouts about one foot long. Was that the proper procedure?—Subscriber, Lodi.

The first three years with the almond should be given to forming the top for future bearing. The first step is to give sufficient strength to body and limbs to carry the weight, hence the first year the top is usually reduced to three or four main branches with three or four buds to each, say six to twelve in length. The next year there is a similar reduction of the branches on the foundation of the preceding year's growth, these to be reduced to two or three six to twelve inches long. The third year the same process is continued, after which different treatment is necessary, according to the thrift, variety of tree, and other conditions.

Spasms

Turkey has been having a kind of spasm at frequent intervals. He jumps sideways and goes round and round, sometimes falling. Has been affected for some time, but eats wells.—Subscriber.

Either this turkey has received some injury which has affected the brain or nerve centers, or there is an irritated condition of the intestines due to indigestion. Try a good dose (one to two tablespoons) of castor oil and follow this for a few days with a teaspoon of Epsom salts daily in moist mash. See that it gets all the green feed it will eat and not much else for a few days. If the trouble is due to an injury there is nothing to be done.—J. A. K.

Canker Mouth

I have been troubled for sometime with canker mouth in my flock of chickens. Have been doctoring with different remedies suggested but so far nothing has helped. Have lost some 200 in about six weeks or two months. Can you give me a remedy? This seems to start with little pimples in the mouth and throat. It seems to be spreading quite rapidly, at first just one bird was affected occasion-

ally and now as many as 25 in a day.—Subscriber, Corning.

Swab out the mouth with peroxide of hydrogen, then swab very lightly with tincture of iodine. Examine the litter in the scratching pens for mold germs and see that your feed, especially the cracked corn, which heats so rapidly, is free from every sign of mold. Sometimes chicken pox is accompanied by sores in the mouth. If there are any scabs or pimples on the head or face or comb it would be well in addition to the peroxide and iodine treatment, to give each bird a grain of calcium sulphide daily. Mix the dose in a little moist mash and it will be readily taken.—J. A. K.

Oak Root Fungus

I have been told that the cause of my trees dying is oak root. Would like to know how to treat the orchard to cure this trouble; also, does it spread through the orchard? There have been no oak trees on the place for 25 years.—Subscriber, Campbell.

Unless there have been other orchard trees on the place since the removal of the original oak trees—if there were any there—there may have been sufficient roots left in the ground to keep the fungus alive in the soil. If so, and the roots interlace, as they often do in an orchard, the disease may spread. If this is the trouble dying trees will usually show mushrooms or toadstools around the base of the tree. This mushroom is known as armillaria mellea and usually kills the tree in from two to four years, though it may remain alive for some years but will not thrive. Make examination of the roots. If affected with this disease they will probably be found to be decayed and soft, while just under the bark may be noticed fan-shaped pieces of white fungus. We believe there is no cure other than to remove the trees and keep the ground cultivated in vegetable or other crops which do not afford opportunity for the fungus to remain alive.

Worms in Cornstalks

Have been troubled this year with a long worm similar to the cutworm eating into stalks of young, growing corn. What is the remedy for this pest?—Subscriber, Azusa.

We think this pest could be fought most effectively by beginning very early in the season with poisoned baits put around the stalks on the ground. Formulas for poisoned bran or other poisons may be found in the Cultivator of November 4.

Onions Splitting

Can you tell me why about half of my Prizetaker onions split up into two or four small bulbs instead of one large one? They were grown from seed planted in September, then transplanted. There was plenty of rain all through the winter until March, which was quite dry and hot. Did not irrigate them at this time. After the April rains irrigated once a week. Bermudas planted at the same time and treated the same made large onions but of course were ripe long before the Prizetakers were. My soil is a light decomposed granite, fertilized with hen manure.—Subscriber, Fallbrook.

Mr. D. F. Reichard answers: "Prizetaker is a late variety of onion and should be planted not earlier than January. When planted as early as yours a late variety makes its nucleus but the cool weather of winter and early spring prevents its enlarging into a bulb, then when the warm

growing weather comes on this nucleus takes its second season's growth, so to speak, and breaks up or divides as a well grown onion does when put back into the ground the second year for seed."

Winter Pear

What pear would you recommend for this locality 16 miles from the ocean at an altitude of 600 feet, soil decomposed granite, not very deep, but no hardpan? Bartletts blight badly and I would like a later pear, one that ripens in September or October, good for table use or canning.—Subscriber, Fallbrook.

Mr. Reichard answers: "Use Winter Bartletts and spray if they are troubled with blight, using Bordeaux mixture. Begin spraying before the buds burst."

Olives Pitting

Am mailing you Manzanillo and Ascolano olives which are badly pitted. What is the cause and what will eliminate this blemish? Also, the olives are not sufficiently large before they ripen. How can I secure greater size?—Subscriber, San Diego.

The olives were badly bruised in the mail or else by wind on the trees before shipping so it is impossible to form a definite idea of the trouble. Will ask the subscriber to send more perfect specimens, if possible. As to size, the only suggestion would be deeper irrigation early in the season. The olive will grow and bear even if there is a slight shortage of moisture, but to secure good size there must be an abundance of moisture in the soil and in the growing of pickling olives a full supply of moisture is essential.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

A Lazy Horse

I have a ten-year-old horse, weight about 1200 pounds, strong, healthy and well fed. Use him two hours a day for light delivery work. He is very lazy and persists in a slovenly jog unless I continually and severely apply the whip. Occasionally when he gets a little excited he can "travel like the wind." How can I make him adopt a faster gait without continually whipping him which looks cruel?—Subscriber, La Jolla.

Your method of driving will make any horse lazy. Throw the whip away, rein up his head and hold the lines so there is a little pressure from the bit all the time. He will go very slow at first but in time will wake up and drive like a horse. It may try your patience to work out this method but I never knew it to fail but once. Occasionally we find a horse that lacks good sense and can not learn.

ADD POULTRY AWARDS AT P. P. I. E.

In concluding Mr. Holman's short account of the poultry exhibit we stated last week that another week we hoped to give the complete list of awards. A few days after that issue went to press the awards were received and we found that it required a 62-page book to contain them and that one entire issue of the Cultivator would not be sufficient to give them all, therefore it has been deemed wise to omit them.

If dependability and economy in your pumping equipment are of importance, you should have a

FROM "THE DAWN"

Again the world is touched with gold,
The parable of dawn retold
In resurrection from the night,
In restoration of the light.

A crystal chalice, in the hand
Of dawn, is held for those who stand
Receptive, eager, trustful, true,
Inspired with zeal to dare and do.
—Julia Hall Bartholomew.

THE CROW IN AUSTRALIA

HE value or otherwise of crows in Australia is one of those debatable subjects that is a perennial source of correspondence from their admirers and enemies in the stock and pastoral newspapers," says a writer in the Agricultural Gazette of New South Wales.

"Many years ago I studied the habits of crows on the plains between Echuca and Kerang, when looking after ewes and lambs in times of drouth in Victoria. I held no brief for the crow, and hated that black, cruel, devilish bird, when I found the fallen ewe with her eyes picked out and the helpless lamb standing beside her, with holes pecked in its tail. One would often see a pair of particularly cunning crows separating a young lamb from its bewildered mother, the first crow flying beside the scared, running lamb, every now and then flapping its wings against the poor little beast, while the second crow would deliberately fly up behind and peck it on the rump to hurry it away from the mob. At other times one would come upon a lost lamb on the plains with a crow flapping round, and every now and then giving a tug to its tail to try and pull it to the ground.

"The sheep owners will tell you that a sheep or lamb pecked, when down, by crows seldom lives, and put it down to the fact that they are carrion feeders and cause blood poisoning. Of course, in bad times with starving stock, many of the old ewes and lambs that get down would never recover, even in the absence of the attendant crows, but such facts do not have much weight with the sheep man when he finds the crows helping in the survival of the fittest.

"The farmer dislikes the crows quite as much as the squatter, and seldom has a good word to say for them. If he runs sheep, he generally has more culls and old sheep in proportion to the size of his flocks, and they are the ones that suffer from the crows. The crow is also an expert at stealing eggs, and his depredations in the fowl yard are only too well known to the housewife. I used to visit a homestead on the plains in Victoria, where three crows formed a syndicate to raid the fowl nests in the stable, where they had the advantage of open gable ends, giving a ready means of ingress and retreat. Their method was as follows: the first crow flew into a she-oak tree overlooking the house and stable and finding all quiet, evidently sent back word, for the second crow flew up and took observations while resting on the roof of the stable; a fresh signal was sent back, when the third crow flew up, hopped down into the manger, and snapped up the egg before the hen had finished cackling, and flew away down the paddock, followed by the two scouts. Many traps and ambushes were laid for the egg stealers, but as far as I know my friend never managed to get the best of them.

"The crow is accused, probably not without reason, of destroying the eggs and nestlings of smaller birds, and it is quite evident that other birds do not trust him, for at nesting time if a crow comes into the tree, all the small birds join together to hustle and drive him away.

"While there is no question as to the damage the crows, when numerous, do at lambing time, particularly

in a bad season when ewes and lambs are weak and starved, during the other portion of the year in the same districts the crow acts as an effective scavenger in cleaning up offal and also destroys many noxious insects, hunting over the paddocks like the magpie, and is very busy when a cut-worm army or a locust swarm appears in the district.

"In conclusion, I would quote Mr. W. E. Abbott, of Wingen, who has always been a firm friend of the crow. After telling how he has found the remains of dead sheep picked clean by the crows, he says: 'It seems to me that that one crow with its unequalled sense of sight and smell, and power of locomotion, would be worth more than 100 men, whose work could not be supervised (in destroying dead carcasses). The 100 men would cost at least £200 a week, and a crow would keep himself to a small extent on eggs or chickens, and a few weak lambs or old sheep in times of drouth.'

"The bushman, while he is interested in the knowing ways of the cosmopolitan crow, does not particularly love that bird, but in his wanderings comes across him in all parts of the great lone land. It wakens him with its mocking, mournful cry when sick and weary in his lonely camp. If he happens to get lost in the scrub, hunting for his horses, away from water, the crows appear, and the inflections in their voices seem to distinctly change, no longer the sharp clear caw-caw, but these notes are long drawn out, sounding to the anxious, bewildered traveler in evil tone, 'When are you going to die—die?'

"Many are the stories told round the camp, regarding the wisdom of the crow, how when an inquisitive crow arrives at a camp where the traveler is resting under the trees apparently asleep, it will pick up a bit of dry bark in its beak, and flying up into the gum tree, drops it on the face of the sleeper to see if he is really asleep or only shamming, before it ventures to come around, and pick up the scraps.

"The outback bushman will tell you he has seen a crow when it has discovered the unprotected eggs in an emu's nest among the saltbush, hunt round for a stone, pick it up in its claws, and hovering over the nest, drop the stone among the eggs, and thus secure an ample dinner. This story may be quite correct—there is very little a wary old western crow does not know—but it lacks confirmation."

PREPARING THE AVOCADO FOR THE TABLE

Suggestions By the California Avocado Association

Served in Skin

Cut the fruit in half. Carefully remove the seed. Serve a half to each person with any of the following dressings, as personal taste directs: Lemon or lime juice, salt, sugar, tomato catsup, mayonnaise, French dressing.

Avocado on Toast

Remove the flesh with a spoon and mash with a fork. Spread thickly on a small square of hot toast. Add a little salt and pepper. This is one of the nicest ways of serving avocado.

Avocado with Caviar

Prepare as the above recipes direct. Spread a small quantity of caviar on top of each piece. This is a very delicious appetizer.

Avocado Cocktail

Cut the fruit into dice. Place in small cocktail glasses, cover with a good cocktail sauce. Tomato catsup with lemon juice and salt and pepper is excellent. Serve very cold, or packed in ice.

Celery and Nut Salad

Fill seed cavity of a half fruit with chopped celery and nuts mixed with a small quantity of mayonnaise.

Apple and Celery Salad

Take equal parts of chopped celery and apple. Heap in a lettuce leaf, cover thickly with avocado meat well beaten with a little mayonnaise. Lemon juice may be used if preferred.

Combination Salad

Make a good combination salad of green vegetables—peas, beans, tomatoes, cucumbers, celery, hard boiled egg, lettuce. Mix with one-half as much avocado meat. Season with French dressing.

On the Half Shell

This is only practicable with the thick skinned variety. Divide fruit in half, carefully remove meat, add yolk of a hard boiled egg and one tablespoon of French dressing for each fruit. Press through a sieve and pile back in the shell of the avocado. Garnish with boiled whites, finely chopped with parsley.

Cuban Salad

In the cavity of a small fruit place three stuffed olives, add lime or lemon juice. A teaspoon of sugar dissolved in the lime or lemon juice is very nice.

If You Care for Onions

Cut the flesh of the avocado in cubes, mix with chopped onions, lime or lemon juice and salt. A finely chopped boiled egg sprinkled on top makes it very pretty.

Aspic Jelly

One-half box gelatine, one-half cup cold water, one cup boiling water, two cups mashed avocado, juice of half a lemon, salt, cayenne. Soak gelatine in cold water one-half hour. Dissolve in boiling water. Strain and add avocado meat which has been flavored with salt, cayenne and lemon juice. Place on ice to harden. Serve with mayonnaise.

With Bananas and Apple

Take one chopped apple, one sliced banana and three medium sized avocados. Mix in a bowl with either French dressing or mayonnaise. Serve on lettuce leaf.

Sandwiches

A good hostess appreciates the value of an original and delicious sandwich. With rye bread—Mash the flesh of three large or six small avocados, season with lemon juice, salt and pepper. Spread between very thin slices of rye bread. A lettuce leaf may be used in the sandwich if desired. This makes about twenty sandwiches.

With Chili Pepper

Chop the fruit with chili pepper. Season carefully and spread between buttered bread, with or without lettuce leaf. The above recipe can be used with nuts or olives in place of the pepper or onions.

An Original and Delicious Desert

Avocado and chopped dates beaten in whipped cream slightly sweetened.

Avocado Ice Cream

Yolks of five eggs, one quart milk, green Maraschino cherries, two cups sugar, four medium-sized avocados, almond or vanilla extracts. Make a boiled custard with the milk, egg and one cup sugar, flavor with almond extract. When the custard is cool add the fruit and freeze. Serve with green Maraschino cherries on top of each dish.

Avocado with Sea Foods

A most appetizing form of serving the avocado is to mix equal parts of cold salmon or lobster with the diced fruit, and serve with mayonnaise.

In Soups

The avocado is used extensively in the tropics in all kinds of meat soups. Cut in small cubes and add to the soup just before serving.

For Invalids

The avocado is recommended by physicians as a most desirable form of food for invalids. It is highly nutritious, containing as high as 25 per cent of fat in the best varieties, according to government statistics, and yet is very easily digested, so that the most delicate person can eat it freely.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Warm Stewed Prunes Cream
Hamburger Steak Baked Potatoes
Fried Mush, Syrup
Coffee

Lunch or Supper

Cream of Carrot Soup
Cereal Sausage Bean Loaf
Bacon and Cabbage Salad
Apple Cobbler Tea

Dinner

Scalloped Chicken and Kornlet
Mashed Potatoes Tomatoes and Okra
Diced Buttered Beets
Squash Pie Coffee

Cereal Sausage

Three-fourths cup hot, cooked cereal, one-fourth cup sifted bread crumbs, two cups crushed nut meats, three-fourths teaspoon salt, one-fourth teaspoon pepper, one-half teaspoon powdered thyme, one-half teaspoon powdered sage, one egg, beaten light. Cream of wheat or other cereal may be used; mix all the ingredients together and form into ten portions to resemble sausage links. Set on a greased pan and let bake about 20 minutes.

Scalloped Chicken and Kornlet

Use remnants of chicken from a roast or boiled fowl. Free the meat from skin, bone and unedible portions. For each generous cup of meat take one cup of kornlet and one cup of cream sauce. Mix the chicken with the sauce, then dispose in layers in a baking dish or in individual dishes, a layer of chicken in sauce and a layer of kornlet. Cover with buttered crumbs (one-fourth cup of butter to one cup crumbs) and let cook about ten minutes, or until hot throughout and the crumbs are browned.

Tomatoes and Okra

Use equal quantities of cooked okra in slices, and sliced tomatoes. For a generous pint of material melt two tablespoons of butter; in it cook a tablespoon each of chopped onion, green pepper and parsley. Mix half a cup of fine, soft bread crumbs with three tablespoons of melted butter; dispose the tomatoes and okra in a baking dish in layers, with chopped vegetables and crumbs sprinkled between the layers. Do not brown the onions and pepper, simply soften them

HAY

Under date of November 27 Scott, Magner & Miller say:
Receipts for the past week were 2729 tons. Last week receipts were 2653 tons.
Railroad companies are now furnishing more cars and from now on we believe they will be able to continue to meet the demand.
There has been no trouble to place receipts and the tracks have been kept practically clear.
The market is firm, especially for the fancy and lower grades. Fancy types are ruling firm owing to the small amount of this quality; the lower grades are rul-

WEATHER CONDITIONS

For the Week Ending November 27, 1915

Report from the various California stations of the United States Weather Bureau by George H. Wilson, director, San Francisco.

—Rainfall Data—

Temperature Data

—Past Week—

	Past Week	Seasonal to Date	Normal to Date	Maxi-mum	Mini-mum
Eureka	3.80	6.88	8.85	64	38
Red Bluff	.51	1.93	5.26	64	40
Sacramento	.03	.82	3.28	68	38

San Luis Obispo	.00	.34	3.34	76	36
Los Angeles	.00	1.34	2.11	76	44
San Diego	.00	.72	1.26	70	46

ing firm owing to the fact that stock throughout the country districts is consuming large quantities of this grade.

Trade throughout the interior continues good. Considerable quantity has been shipped to the southern markets, both Los Angeles and San Diego. Shipments are even reported to have been made during the week into the San Joaquin Valley, where, as a rule, there are large quantities on hand for shipment to this market.

Export trade continues good and with the prospective opening of the Panama canal on January 1, which the reports now indicate, this trade should improve very materially, shortly after the first of the year.

Receipts of alfalfa are small, demand good and arrivals have been placed readily.

Receipts of straw are small with very little demand.

We quote the average wholesale prices for hay in carload lots on today's market as follows:

Fancy Wheat Hay (16 bales)...	17.00@18.00

Citrus Fruit Market

LOS ANGELES, Dec. 1, 1915.

The state is now sending out 700 or 800 cars weekly of navel oranges. The market is hardly established as yet, the sales having ranged from \$2.25 to \$3.00. Another week will give opportunity to judge more as to the early market's behavior. The outlook is good, however, and it is thought the holiday fruit will command a ready market.

The lemon market is rather stronger and it has every indication of still further improvement.

Shipments

Shipments of oranges from Southern California to date since November 1, 426 cars, lemons 326, total 752. To same date last season, oranges 275, lemons 284, total 559. From Central California, oranges 410 cars, lemons 39, total 449. To same date last season, oranges 397, lemons 59, total 456. From Northern California, oranges 101 cars; last year same date 131 cars.

NEW YORK, Nov. 29.—Ten cars Valencias, four cars lemons sold. Valencias higher on best grades; lemons strong.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department. Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

Exempt from Execution

A man having made a failure at ranching and not being able to pay his just and honest debts, how much would he be able to hold lawfully without danger of seizure?—Subscriber.

Household furniture is exempt from execution, farming utensils not exceeding in value \$1000, two horses or mules and harness and cart, buggy or two wagons, food for such animals for one month, provisions and fuel for individual use for three months; three cows, four hogs and piano, shotgun and rifle, tools of a mechanic, poultry of the value of \$75, earnings of a debtor for personal services for 30 days, except where debts are incurred for necessities of life then one-half of such earnings, shares in a homestead association to the value of \$1000, material to the value of \$1000, for construction of a building, machinery for constructing artesian wells to the value of \$1000, life insurance for annual premiums not to exceed \$500, shares of stock in a building and loan association to the value of \$1000.

The above is a synopsis of Section 690 of the Code of Civil Procedure, which does in fact provide more particularly for more of the exemptions. There is also a homestead to the value of \$5000 if married with a family dependent upon one for support and to the value of \$1500 if there is no such family dependent.

Installing Water Pipe

I would like to know if a water company is obliged to pipe the water to its patron's line? The water pipes would have to cross or come down the line between two patrons to get to my line. Who would have to pay for the pipe and meter?—Subscriber, Otay.

Under recent ruling of the railroad commission a water company which is a public utility is required to install and pay for service pipe and meter.

Road on Government Land

I have 160 acres of land purchased five years ago. Road we have traveled since purchase of land and for 15 years previously is across government land, until now unfenced. It is now taken up by homesteader who pro-

poses to move road quarter mile and put gates on it. Can I keep an open, public road where it is now, without gates and how?—Subscriber.

One cannot acquire a right by adverse possession of prescription against a sovereign state, so in the above case you have not acquired any rights across lands belonging to the United States government. A homesteader therefore takes his land free and clear of any assumed right of way which you have had across it.

Collecting Rent

A lets piece of land with house on for one year to B. When year is almost past B vacates house and lot, never having paid any rent. What can A do to collect the rent due him? If a tenant demolishes or damages the property what can owner do to get compensation?—Subscriber, Puente.

The owner can bring suit against the tenant to recover judgment for damages done to the property by him or for rent which he refused to pay. He has no further rights than any other creditor.

Wife's Signature

Wife refuses to sign deed to community property on mortgage. Is her signature necessary?—Subscriber.

The husband has the management and control of the community property with absolute power of disposition other than testamentary, as he has of his own separate estate, provided that he cannot make a gift of the community property or convey the same without a valuable consideration unless the wife in writing consents thereto. The above is taken from Section 172 of the Civil Code, which gives the husband the absolute right to deal in the community property either by deeding away real property or transferring personal property without the necessity of obtaining the signature of the wife to the instrument of transfer so that it is unnecessary to obtain her signature to convey a valid and perfect title to any portion of a community property. Title companies out of an excess of care invariably require the name of the wife to the deed, but this is purely for their own protection and is not a requirement of the law.

Employer's Liability

I have been working for a rancher six months and was taken sick on his place. Will this new liability law force him to pay me all or part of my wages?—Subscriber, Redlands.

The workman's compensation act, though broad in its terms, has not yet made the employer an insurer of the health of the employee. The only liability which the employer is under is for a personal injury caused by the employment.

New Dairy Law

Would like information as to the necessity of pasteurizing milk by a dairyman having one or two cows, where the milk is sold in his own immediate vicinity. If cows are tested according to the law which will be effective a few months later and the animals are found to react may one still sell the carcass to the meat market? Who determines as to the stock being infected, that is, is there a state deputy or does one employ his own veterinarian, and who bears the cost?—Subscriber, Azusa.

The act referred to, which goes into effect October 1, 1916, makes it unlawful for any person, firm or corporation, except in bulk to the wholesale trade, to sell for human consumption any milk from cows which have not passed the tuberculin test, until it has been pasteurized. It is further made unlawful to sell in any city or county in which a milk inspection has been established any milk otherwise than as graded and inspected in accordance with the provisions of the acts grading milk as certified and guaranteed, Grade A, Grade B and impure. If a dairyman operating in a district not under an inspecting department desires to sell milk he is permitted to file with the state veterinarian a written request for the tuberculin test and after filing such request he may proceed to sell milk until such time as the state veterinarian makes the test. Thus in case of

dairymen operating in districts not under a local inspection service the state veterinarian tests the cows. Where it is under an inspection department the veterinarian of the health department of that district, either city, county or group of counties, tests the cows. No provision has been found prohibiting the sale of the carcasses of animals found to be infected under the tuberculin test, but to be entirely safe on the matter you should correspond with the state veterinarian.

Selling Water

I supply my ranch with water from a canyon not on my land. At certain times I have more water than I need. Can I sell water to my neighbors on adjoining lands without obligating myself to furnish them water when I have none to spare or don't want to?—Subscriber, Hollywood.

By contract with your neighbors you would be entirely safe so far as obligating yourself to continue to furnish water to them is concerned. By selling water to your neighbors you would thereby become a public utility and subject to the jurisdiction of the state railroad commission and also of the state board of health.

IDEAS FOR THE COOK

Continued from Page 549

a little; cover the dish, and let cook about half an hour. If preferred the dish may be left uncovered and the last layer be of crumbs.

Bacon and Cabbage Salad

Broil four slices of bacon and mince it, mix with one-half cup of shaved cabbage and one-half teaspoon each of minced onion, beets, horseradish, a little paprika and a few drops of tarragon vinegar. Serve with a cooked dressing.

AGRICULTURAL ENGINEERS

The American Society of Agricultural Engineers will hold its annual meeting in Chicago, December 28-30. Special attention will be given to discussion regarding farm structures and machinery, with especial attention to tractors, their strong and weak points.

SUITABLE FODDER

The fifth day drew to its close with the twelfth jurymen still unconvinced. The court was impatient. "Well, gentlemen," said the court officer, entering the jury room, "shall I, as usual, order twelve dinners?" "Make it," said the foreman, "eleven dinners and a bale of hay."—Credit Lost.

Arizona will ship its wool clip quite freely to the Boston market. It is estimated that it will go at approximately 65 to 67 cents for cleaned wool.

CALIFORNIA WILD FLOWERS

Theodore Payne, a California wild flower specialist, with seed store at 345 South Main Street, Los Angeles, has prepared a 24-page illustrated booklet touching upon California's wild flowers. It gives a number of cultural notes, a classification of wild flowers according to color effects and an alphabetical list with short description and notes as to requirements. The book ends with a number of lists of seeds which make good mixtures for varying conditions. It also contains a list of California native bulbs. Mr. Payne has found it necessary to put a price of 15 cents on this catalog. Post paid to any address.

SAMSON SIFTINGS

The Samson Iron Works of Stockton is sending out Volume 1, No. 1, of Samson Siftings, devoted exclusively to the Sieve-Grip and other manufactures of the great Samson works at Stockton. It is a most creditable house organ.

Protect Our Good Name

GOODYEAR
AKRON

STRIPPED to the waist, his huge torso streaming with sweat, a workman swings the heavy iron core to an iron table, and wrenches off a tire which has just come steaming from the heater.

His eye falls on the legend over his head, and he smiles.

Our good name is also his good name.

The two are intertwined.

He will protect the one, while he subserves the other.

His thoughts are—as they should be—chiefly of himself, of his little home, and of his family.

Their good name, his good name, our good name—his good work will stand guard over them all.

* * *

Two thousand miles away—in Seattle, we will say—the same thought, in the same simple words.

An irritating moment has arrived—the temptation to speak sharply to a customer, to fling a slur at unworthy competition.

The salesman, or the manager, or whosoever it may be, looks up, and the quiet admonition meets his eye.

Protect our good name.

In a twinkling it smooths the wrinkles out of his point of view.

He is himself again—a man with a responsibility which he could not escape if he would; and would not, if he could.

* * *

Back two thousand miles

again to the factories—this time to the experimental room.

An alluring chance to save—to make more profit by skimping, by substitution. No one will ever know. But—the silent monitor repeats its impressive admonition:

Protect our good name.

What chance to compromise with conscience in the presence of that vigilant guardian?

* * *

Thousands of men striving to keep a name clean.

And keeping their own names clean in the process.

* * *

We Americans, it is said, make a god out of business.

Let the slur stand.

Whether it be true or not—it is true that business is our very life.

Shall it be a reproach to us that we try to make business as good as business can be made?

* * *

Think of *this* business, please, in the light of its great animating thought: *"Protect our good name."*

We are thinking of you, always, when we say it—you American millions, and you other millions in the old world.

We think of you judging us, judging us—by what we are, by what we do, by what we make.

We think of tens of thousands of homes in which our name can be made to

stand for that which is worthy and worth while.

We must not lose your good will—we must not tarnish our good name.

* * *

You can call that anything you like.

You can call it business, or sentiment, or idealism, or nonsense.

It may be all of these.

It may even be that which our national critics call making a god of business.

But at least it gives to us a motive that is bigger and broader and deeper than money.

It makes thousands of men happier in their work and more faithful to it.

It has made of this business a democracy of united thought—a democracy of common endeavor—a democracy of purpose and principle.

* * *

And here is the oddest thing of all:—

The more we live up to this "impractical" ideal, the greater the business grows.

The more we labor for the future, the more we profit in the present.

The more we strive for character, the greater the reward in money.

The more we put into our product, the more we take out in sales.

Perhaps, after all, there is more than one sense in which it is good to make a god out of business.

We think so.

And we think you think so.

H. A. Dribbling, President
The Goodyear Tire & Rubber Co.

Visitors to the Goodyear factories are always impressed with a framed sign which confronts them at every turn.

In every room in every Goodyear building, they encounter the same message: *Protect our good name.*

It hangs on the walls of all the Goodyear branches throughout the country, and is being adopted by tire dealers everywhere as an expression of the spirit in which their business is conducted.

We believe that the public will be interested in the analysis of this simple but striking sentiment which is published here-with.

Threshing Ventura County Beans.

Lima Beans in Ventura County

The Editor is Given a Ride Through a Little Section of Beandom and Observes Activities Which Bring Millions in Gold to California. Methods of Culture Described and Illustrated

HAT little triangular-shaped county sandwiched in between Santa Barbara and Los Angeles Counties which is called Ventura, has only about one-third of its lands tillable because so many of them "stand on edge," but these valleys and foothills are so wonderfully rich and productive that this county has become noted throughout the United States for its great production, especially of lima beans, of walnuts, and of lemons.

The county is one of the younger ones of the state, having been cut from Santa Barbara County in 1871. But some years before that it began raising the lima beans which, more than any other one product, have made it famous.

To be exact, in 1868 a man by the name of McAlister who lived in the town of Santa Barbara became friendly with the captain of a small trading vessel lying in the harbor for the purpose of trading South American products for hides, tallow and other California products. On one of Mr. McAlister's visits to the vessel the captain invited him to remain for a meal at which some exceptionally large beans were served, purchased by the captain in South American ports. He stated that they were ordinarily called in the markets of South America "lima" beans. Mr. McAlister begged a hatful of these beans for trying out under California conditions, afterward dividing them with Mr. Henry Lewis. From this small supply was created the great

lima bean industry of the county, the total acreage of which now approximates 67,000, with perhaps 10,000 acres still available for lima bean growing.

The county produced last year 1,200,000 80-pound sacks of limas. These were produced by about 600

Some of these lands have been persistently used for growing lima beans for more than 40 years and are yielding now so heavily that their owners are holding them at from \$350 to \$750 per acre. Nearly all of these profitable crops are produced without irrigation, for only about one-

sacks. While there have been produced as high as 45 sacks of limas such a production results only from a combination of exceptionally good season and best of care. The average production of black eyes is about 15 sacks on irrigated land and ten sacks on non-irrigated, with a record around 20 sacks per acre.

Asked as to preparation of land and the cultivation, Horticultural Commissioner Brock said: "The land is first plowed deeply in the fall and as soon in the spring as they can get on the land it is gone over with a heavy clod masher made for this work. The cyclone is then used and the chisel, harrow and weed knife. In all the ground receives from five to seven cultivations before the beans are planted. They then receive three cultivations on an average during the summer to keep down weeds—this is done with a cultivator made for that purpose. The beans in some sections are also hoed from one to three times where the morning glory is bad.

"So on the whole from starting in the spring to prepare the ground until the crop is ready for harvest from eight to 11 cultivations are given."

Bean planting may begin as early as April 1. Only one instance is known of beans having been planted in March, but early in April—in fact any time in April—is considered by many too early. May 10 is considered the ideal date, while June 10 to 15 is the latest planting date. Planting is done entirely by horse-planters, the

Continued on Page 562

A Ventura County Bean Field

As far as the eye can see over the hillsides these piles of beans show the result of the season's cultivation. The fields were plowed for this crop about one year ago and the harvest was only completed a few weeks ago. In the middle distance at the left may be seen the cook house and other preliminaries for the coming threshing outfit.

bean farmers. This year's output is not definitely known as yet. It will be somewhat lower, however, than last year. In addition the county had last year an output of about 500,000 sacks of black eyes. This year's output will be perhaps in the neighborhood of 450,000 sacks.

tenth of the lima bean land is fitted for irrigation. Where irrigation is practiced there is usually but one application.

The average production per acre on irrigated land is approximately 30 sacks, on non-irrigated land about 20

Types of Ventura County Bean Growers' Homes.

Ventura County has many home-like places, as shown on this and the cover page. The photo at the left shows the home of Mr. Geo. Gardner at Ventura; the center, home of Mr. E. S. Duval, Saticoy; right, Mr. C. J. Daly's residence at Camarillo. The photo on the cover is of the home of E. W. Gerry at Ventura.

Did you ever consider the importance of selecting your nursery trees for orchard planting? This, as well as BUD selection, careful growing and training, are the vital points to insure the future of your grove as a standard fruit producer and a paying investment. The more fibre roots you have on a tree the better it will transplant and the better it will grow and establish itself in the soil.

Write us the acreage you contemplate planting, the character of your soil and situation, and the varieties and number of trees to be planted and we will mail you gratis a copy of our book on "Citrus Culture", which describes the citrus industry from seed bed to bearing trees, harvesting, packing and marketing.

OBSERVATIONS BY EASTERN EXPERT

By Geo. T. Powell

(Continued from Last Week)

IN a study of productiveness of deciduous fruit trees, covering a period of over 30 years, the evidence has been pretty conclusive as to why, with the many millions of apple trees that for a half century have annually been planted, there has not been a larger overproduction of this most excellent fruit.

For this fact there are two causes; first, many trees that are planted never reach a bearing age, and second, many that do produce little or no fruit. Where but a few trees are planted for home use, if one fails to bear fruit it is quickly discovered, but in commercial planting, where large numbers are put out, the unproductive ones are not generally discovered or recognized.

Nearly 30 years ago when invited to deliver an address before a nurserymen's convention in New York, I spoke upon the importance and value of the propagation of a better class of trees, those of higher productiveness with more of fixed quality, which I believed could be obtained through a system of careful bud selection.

There were a few nurserymen present who agreed with the proposition, while a number took issue against the principle as being of no value.

After a full discussion of the subject from the floor of the convention I gave one of the leading nurserymen present an order for 150 Northern Spy apple trees, as a strong foundation stock, and went with him personally to select buds from a very fine individual Sutton Beauty apple tree which for a number of years I had observed upon his place at Geneva, New York. Buds from a Thompsons County King tree of known quality were also selected, and the nursery trees budded with these two varieties.

The King is one of the choicest apples that is grown, of fine flavor, size and color, but as ordinarily propagated is of no value for commercial planting because of inherent constitutional weakness and susceptibility to canker which destroys 50 per cent of the trees before they reach profitable bearing age.

Through the selection of a strong vigorous stock and buds from a strong individual tree that has reached 30 years of age, untouched by disease, this block of trees, now nearly 30 years old, has produced heavy crops of fruit annually for a quarter of a century, with every tree yet sound and free from even a cankered limb.

The Sutton Beauty has been carried to the third generation through this method of bud selection, and in the third orchard so propagated every tree looks as though it has been cast in the same mold, so uniform is it in production, and in the general character of the fruit. Buds have been obtained from these trees, and I have since been obliged to forbid some nurserymen from advertising their stock as pedigrees from my bud selection. They at least believe in them for making sales.

In the observation and study of the orange and lemon trees of California I found the same conditions as with our deciduous trees in the orchards of the East, some highly productive and many unproductive under the same soil and general cultural conditions.

I was much interested and quite surprised to meet a number of growers, and also a few nurserymen, who were propagating trees through bud selection, and who were able to show the evidence of its value.

One of the oldest and most enthusiastic growers of the state who has built up fine orange and lemon orchards with trees grown from carefully selected buds took great pains to show blocks of the most beautiful and highly productive trees that I have ever seen.

Trees were shown for comparison that were full of rank growing, unproductive wood with little fruit, of coarse, undesirable quality, while large blocks of trees were seen, that showed uniformity in large and regular production of fruit of the highest quality in market value. These trees were perfect in form, with a right distribution of fruit bearing wood upon which a pruning knife had never been used except to remove an occasional undesirable branch which the grower was able to recognize as of an unproductive type that later would require unnecessary time and expense to remove.

This grower, past 70 years of age, had studied so closely every tree on his place that the first year after planting, he feels certain that he can determine the character of the new growth, and with a pocket knife takes out the undesirable branches that later would require a useless expenditure of labor and cost in pruning.

In propagating new trees he selected the buds from such trees only, and in the third year they made a uniform growth which had paid the entire cost of their culture.

The value of bud selection measured by the results obtained by this very intelligent grower seemed substantially confirmed when later I looked over thousands of trees that at a large cost were being heavily pruned of unproductive wood.

One of the most interesting and instructive lines of work that I saw was that being done by Mr. A. D. Shamel at Riverside. He is a representative of the department of agriculture at Washington and is making the most extensive, systematic and scientific investigation of the law of variation in the productive properties of citrus fruit trees ever attempted.

After spending considerable time with Mr. Shamel studying his work and his records thus far obtained and observing the productive and unproductive citrus trees in extensive acres of orchards, it was clearly evident that there were sufficient unproductive trees upon many acres to bankrupt the growers who owned them when prices are low, even with the best cultural methods they may employ.

If all of the trees were of the same character as many of the very highly productive ones that were examined

there would be a satisfactory return even under the present low prices for oranges and lemons. The experiment station at Riverside is working upon some most important problems in relation to soils, cover crops, fertilizers and cultural methods.

Overproduction of Citrus Fruits

The question was frequently asked by growers if this great industry were liable in the future to suffer from overproduction? That was a most difficult question upon which to give an opinion, but there were a few points upon which I did venture to give judgment, among which were, that land in the future must be purchased at its normal value by those who were interested in the industry; that land best suited to that class of trees and production should be carefully selected; that those interested to invest should go to the organized industry for information rather than to real estate sources with little or no knowledge of the business and where interest only is in the sale of land; that in the state university, experiment station and the state commission of horticulture there are men among the ablest in our country who could give information and advice that would be of real value to all purchasers of land; that the citrus industry through the California Fruit Growers' Exchange has the most complete and efficient selling organization known in the world; and that the producers need only to make their product such as the buyers and consumers demand and then for many years to come there should be satisfactory profits in the business.

Your laws are exceedingly well enforced against insect pests, tree and plant diseases, adulterated seeds and quarantine requirements. It was refreshing to meet instances where inspectors from the horticultural commission were treating trees on the property of private owners who had failed to comply with the law, the expense for which their property had to meet.

This was in striking contrast with the millions of valuable trees in the East that are allowed to be ruined by the San Jose scale, the tent caterpillar, and other insects destructive to vast property interests, through the inactivity of the state departments of agriculture in enforcing the laws.

The reason for this most unsatisfactory condition in the nonenforcement of agricultural laws in the East, and there are good ones on the statute books, is that fruit culture as yet is largely a secondary interest and there is not sufficient sentiment to demand of agricultural departments more rigid enforcement.

I met a number of your county commissioners and inspectors of nursery stock at their work, who were men quite above the average in knowledge, ability and efficiency and were actively and intelligently upon their jobs.

Connected with the subject of overproduction are some vital economic problems that are receiving much attention. So long as there are vast numbers of people in our country who are suffering for food and who have to be fed through charity there is no overproduction. There are great numbers of people out of employment. Our country is suffering from underconsumption, not overproduction. Practically every line of business has been obliged to cut down expenses and to reduce employes because of lessened demand for its output. This is true of other countries. For a number of

years government commissions have been appointed to investigate the causes of the general worldwide business depression.

The future has in it substantial promise of prosperity that will be more permanent and uninterrupted through a more general opportunity for productive labor to share in its fruits, and more fully in the wealth that should enable every industrious person to become an independent, self supporting, self respecting, patriotic and loyal citizen of our country.

With these conditions coming no one need fear the permanent overproduction of oranges or lemons or of any commodity that will add to the needs or the pleasure of our rapidly growing population.

Among the many interesting things that I met during my stay in your state of great accomplishments none

interested me more than the people. Your educational system is exceptional and it tells in the high degree of intelligence, in the energy, and progressive spirit of your citizens.

By the courtesy of the board of directors of the California Fruit Growers' Exchange I was invited to attend and to sit through several executive meetings. In doing so I gained much valuable knowledge of the manner in which the many intricate and difficult problems of the exchange were handled where the interests of over 7000 producers were involved. I was greatly impressed by the efficiency and the interest exhibited on the part of so large a number of representative business men who were giving so much of their time and best thought to one of the great industries of the state.

When corporations generally recognize the spirit of true cooperation that extends its interest to every member who is a factor in the success of their

work, then will discontent and disaffection cease, and the highest satisfaction follow in the results that are produced.

IRRIGATING OLIVES

Touching upon the production of olives Deputy State Commissioner Weldon refers to the fact that Tehama County, which ties Riverside County for second place in the olive production of the state, has a very light crop following the heavy crop of last season, he adds:

"County Horticultural Commissioner Weeks states that irrigated olive orchards have about 60 per cent of a crop, while non-irrigated have only 30 per cent. The great necessity for irrigation is thus plainly indicated. Fresno County will harvest the third successive normal crop."

It is true of nearly all fruits that they require, while maturing one crop, sufficient moisture for the immediate needs and, in addition, the vitality of the tree must be sustained as a foundation for the next year's crop.

FORTY Horse Power 7 passenger FOUR \$885

Comfort -for SEVEN full-grown people

Famous as this Studebaker 4-cylinder car has become for its abundance of POWER, it is just as noteworthy for its COMFORT-giving capacity. Price has been reduced \$100—from \$985 to \$885—but the capacity of the car has been GREATLY INCREASED. It is built for SEVEN people's comfort. And it is the ONLY 7-passenger 4-cylinder car that has ever been offered in America or Europe for less than \$1000.

The wheelbase has been INCREASED from 108 to 112 inches. The tires have been INCREASED from 33 x 4 to 34 x 4 Goodrich. The spring suspension has been greatly improved. The depth of upholstery has been INCREASED. And the auxiliary seats fold down into recesses in the floor of the tonneau completely out of sight. Not a detail has been overlooked that adds to riding-comfort.

With such COMFORT, this Studebaker combines POWER that no car at its price can equal—FULL 40 horse power—and a motor that equals most of the Sixes now on the market in Power and flexibility. And in quality, it stands supreme in the 4-cylinder field. For while its price has been reduced \$100—from \$985 to \$885—it has been greatly increased in power, size and quality. And wherever materials were changed, BETTER materials were used. As for example, the upholstery which is the finest, hand-buffed, semi-glazed leather.

For more than half a century that name of Studebaker has stood for sterling quality—for mastery of the world's most difficult transportation problems. You know, as your fathers before you knew, how Studebaker products STAND UP thro' any tests—and now can you wisely buy any car until you have seen this latest and best Studebaker and KNOW the GREAT value that it offers? See the car at once—and write for 1916 Catalog

Stop Losing Money

If your clipper bruises an orange's skin you open the way to decay. The cut may be too small to notice—one decaying orange may spoil an entire box.

You won't bruise fruit if you use **WISS ORANGE CLIPPERS**

The blades are specially curved and ground; the points and outer edges are rounded to avoid bruising.

U. S. Government experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they last longest, do best work and save money by minimizing the liability of bruising the fruit.

MARKETING CALIFORNIA WALNUTS

Written for the California Cultivator
By J. G. Berneike

EALLY it gives one pain to think of the time when growers received about five cents per pound for their walnuts. It was so painful to the growers of that day that they concluded they would apply some remedy for the pain. And out of this grew the associations. They have had their ups and downs, but they seem now to be firmly established. Whereas each association acted independently at first in selling, turning the selling end of their business over

however, there has been some progress in the right direction, for there is a gradual growth of the associations and the coast packer has been eliminated. There are more associations today with a larger average membership. The sale of labeled package goods to consumers is preparing the way to deal more directly with them whenever the associations are ready to grasp the opportunity. In dealing directly with the consumer the article of consumption must be standardized as to price and quality, especially as to the latter. This is being accomplished by the establishing of the brand known as "California Diamond Brand Walnuts" or a guaranteed

TRADEMARKED-ADVERTISED MERCHANDISE

R. V. Holland

WE often talk of a man making a name for himself. By this we mean that John Smith, for example, has excelled in his particular calling and that his name stands for par-excellence in the field in which his reputation is known.

People who have occasion to utilize the services or seek the advice of anyone in John Smith's line naturally look to him for the very best service obtainable.

If he happens to be a lawyer we look upon him as authority in matters pertaining to law and when in need of legal advice of importance we go to him.

Why don't we select Tom Jones, Bill Brown or some other lawyer from the many whose advice can be obtained—usually at a lower cost than John Smith's?

For the simple reason that John Smith has earned a reputation for legal ability which is within itself an assurance that we will get efficient, reliable service and advice from him, whereas, in the employment of other lawyers of unproven ability we must assume a risk which, if we have much at stake, is both unwarranted and unwise.

It is possible that some unknown lawyer might serve us to as good advantage as John Smith, but we don't know it and we simply cannot afford to take the chance.

Surely no good farmer would plant seeds of doubtful worth. There would be no good reason for his doing so. There are too many standard brands of seeds, results from which he can absolutely depend upon under proper conditions.

The same principles apply to merchandise in every line. The markets are full of goods of proven worth and those consumers who have devoted much study to the matter have become convinced that it invariably pays to buy products, the producers of which have made a reputation for them. Experience has taught them that goods of known quality not only afford consumers ample protection against deception from a merchandise standpoint, but insure an equitable charge as well.

Cultivator readers should be able to secure standard products in every line from their local stores.

Advertisers of standard products in our columns offer your merchants the same inducements to handle their lines as they do merchants anywhere else. All of our advertisers are reliable, otherwise we would not accept their business.

We are spending a great deal of money in an effort to improve merchandising methods in this field and, of course, consumers will be the largest beneficiaries from this work.

You can assist us materially by demanding brands of goods advertised in the Cultivator, and at the same time buy with the assurance that you are getting value received for your money.

to some large California packer on a commission basis, the different associations of the state for the last three years have maintained a common sales agency with headquarters in Los Angeles. And for the past two seasons they have sold directly to Eastern brokers without the intervention of California packers, with a saving to themselves. But let us not say that we have reached the limit of perfection.

In the first place, while a majority of growers now belong to the associations, and while the bulk of the crop is handled by them, there are yet too many outside. Occasionally some of them get a better net price than members of the associations. This is apt to stir up dissatisfaction, but the average, however, is generally less.

In the second place, we have not yet come as close to the consumer as we should come. In both respects,

cracking test. The 100-pound sacks going to dealers and the packages sold to consumers all bear the Diamond brand. As long as the associations strictly maintain the guaranteed standard, just so long will the public have confidence in this brand and call for it. While the dealers have had a chance to judge of this brand for quite a number of years, in buying the 100-pound sack the general public had its first introduction to it in 1914, and is having it on a large scale in 1915. Nearly 3,000,000 packages, mostly of the one-pound variety, have been ordered by the trade, and the headquarters of the California Walnut Growers' Association at 823 Traction Avenue, Los Angeles, is a very busy place, for here about 80,000 packages a day are put up.

Heretofore when consumers bought walnuts in the East they could not tell where they were grown. There could

be no better advertisement devised for California walnuts than these attractive packages. If they are satisfactory to the consumer he knows what to call for when he wants more like them, and he will shun buying in bulk unless well assured that they come under the same brand. The grower must see to it that the high standard for this class of goods is rigidly maintained.

How large a crop can be marketed must depend upon the demand. The demand can often be largely increased by teaching new uses for the same thing. Hence the importance of placing in these packages a small booklet of good and tested recipes.

These packages offer the opportunity of advertising to the consumer the walnut byproducts of the associations, an experimental beginning of which is now being made. And these in turn can be used to advertise the walnuts.

Some time ago I pointed out through the columns of this paper how walnut growers and dried fruit producers might work together in a mutual advertising campaign which would help ultimately to unite growers on the same selling agency and to bring our products closer to the consumer. This will no doubt be brought about in course of time. It may require some strong hand to take the initiative. Meanwhile we shall wait patiently for such a happy conclusion.

MAKING BORDEAUX

Written for California Cultivator
By Pedro A. Bovet, Director of the
Agricultural Experiment Station in
Buenos Ayres Province,
Argentina

Referring to the question and answer on "Permanent Bordeaux" in Cultivator of August 26, 1915, just received, allow me to say that:

I think decidedly from my own experience that there is nothing like preparing one's own Bordeaux spray with quick lime, slaked by oneself also, to obtain good spray which sticks splendidly, especially on peach trees. The good lime slowly and patiently slaked is therefore a first condition. The same is true for paste.

Now, for the satisfaction of your inquiring subscriber and other orchardists, let them further know the fact that a certain amount of casein (a cheap byproduct of milk) added to Bordeaux spray will increase its adhesive and wetting power. This has been tested by Messrs. Vermorel and Dantony, with whom we have corresponded regarding another fact which they these very last years established simultaneously through conscientious outside trials. This addition of casein to an alkaline (properly made) Bordeaux spray permits of reducing the percentage of sulphate of copper from two or three to one per cent, and even as low as one-half per cent without lessening its fungicide properties.

Orchardists and viticulturists will seize the economical importance of such a reduction for European and South American conditions, where copper sulphate actually costs 75 pesos Argentine currency per 100 kilos (more or less \$30 gold American) owing to war conditions!

The method of preparing caseined Bordeaux spray which has greater wetting and adhering power is, as indicated to us by Messrs. Vermorel and Dantony: Stir and mix thoroughly together in dry state 50 grams of powdered casein and 100 grams of rich powdered lime. Add very little water so as to obtain a paste. Little

by little dilute this paste by gradual addition of more water in small quantities until a total volume of one liter is obtained. The absence of clods in the bottom of the container will show that the dilution has been properly made. Greater quantities of this solution may be prepared in advance.

For use add one liter of casein solution to every hundred liters of common alkaline (turns litmus paper blue) Bordeaux spray, when it will be ready for use.

As you see, it is very cheap and easy to prepare. It would be decidedly interesting for orchardists to make a trial caseining not only the Bordeaux usual formula, but Bordeaux in which copper sulphate has been reduced (also lime, of course) to one per cent and caseined also.

These trials would be especially interesting for us against peach leaf curl and mildew in vines.

There is no apparent reason either against adhering and lasting properties of Bordeaux dressing for trees being also increased by addition of casein solution. What about trying?

SPRAY ALMONDS AND PEACHES FOR BLIGHT

Harry P. Stabler, horticultural commissioner of Sutter County, is sending out the following warning:

"Peach blight has done much damage to almond trees during the past two years and has seriously injured the crop. While peach growers have usually sprayed their orchards at least once during the season for blight, many almond growers have entirely neglected their trees in this re-

gard until the blight has become a serious menace.

"All almond trees should be thoroughly sprayed between November 1 and December 15 and again just before the trees bloom. The first application may be either Bordeaux mixture or lime-sulphur, but the second spraying should be done with lime-sulphur."

TO REESTABLISH RUINED VINEYARDS

Two hundred thousand acres of vineyards planted with European vines, it is estimated, have been destroyed in California by phylloxera since its introduction into this country. Except in the case of vineyards which can be flooded cheaply and the insect killed in this way, the only means of reestablishing these vineyards is to grow the European varieties on native stocks that are resistant to phylloxera.

To assist grape growers to do this the department of agriculture has just published Bulletin No. 209, "Testing Grape Varieties in the Vinifera Regions," which records the results of investigations carried on at a number of experiment vineyards in the years between 1909 and 1913. The chief feature of this bulletin is a series of extensive tables showing the behavior of the important European varieties of grapes when grown on their own roots and also when grafted on the various stock varieties whose roots are resistant to phylloxera. It is of course important to know the relative relationship of stock and scion and the behavior of each variety towards the resistant stocks on which it may be grafted, and it is this information which the tables already mentioned furnish.

In the past the lack of this information as to the best varieties and stocks for special conditions has rendered useless the efforts of grape growers to reestablish vineyards which have been destroyed by phylloxera. The growers planted varieties that were not resistant, or used the wrong resistant for the locality, or selected stocks that were not suitable for the varieties grafted on them. These and similar mistakes have prevented the more widespread use of resistant varieties as stocks. The information now collected and published by the department of agriculture, however, should render such mistakes unnecessary in the future.

CYANIDE KILLS ANTS IN SEED BEDS

Ants like to get into seed beds and carry away the seed. They also cause trouble by making their nests in the bed. All nests in the vicinity of the bed should be destroyed before it is made. J. R. Watson, entomologist to the University of Florida experiment station, recommends that a solution of potassium or sodium cyanide in water be used in destroying the nests. The sodium cyanide is probably cheapest now since the price of potassium is up.

Punch a hole about a foot deep through the main entrance with a stick and pour into it a few fluid ounces of the solution. When the liquid has soaked in cover the hole with earth and tramp the surface solid. The gas given off will penetrate the galleries and kill all the adults and pupae in the nest. This should be done at night or in the early morning when a large majority of the ants are at home.

Carbon bisulfide can be used in the same way but it is more expensive, and highly inflammable. Kerosene may be used but it is not quite so effective and does not penetrate so readily.

*For Well-Branched, Fibrous Roots,
Freedom from Disease and Hardiness,
Foothill Grown Trees Have No Equal.*

Order Your Trees While Our Assortment is Complete and Take Advantage of Our Special Prices

Fruit Growers know the merit of our foothill grown stock and the advantages that the early buyer gets both in price and selection. Planting is going to be heavy this year, and tree stocks are short of last year, so make your selection now and avoid disappointment.

HERE ARE A FEW OF OUR SPECIALTIES

PRUNES

There is always a shortage of trees in FRENCH, IMPERIAL, ROBE DE SARGENT, SUGAR AND STANDARD ON MYROBOLAN ROOT. These are the best selling varieties this year and there will again be a shortage. We have a fine block of trees on Myrobolan root in each of the varieties.

CHERRIES

We have a good stock on both Mahaleb and Mazzard root, and can take care of your orders in any of the following: ROYAL ANNE, EARLY BURBANK, EARLY CHAPMAN, EARLY PURPLE GUIGNE, BLACK TARTARIAN, BING, LAMBERT AND BLACK OREGON.

WALNUTS

Our scions of Franquette and San Jose Mayette are cut by the pioneer walnut expert of the State, R. Wiltz of San Jose.

OLIVES

We are offering a limited number of trees of Mission Olives worked on Picholine root.

We have a complete assortment of all varieties of citrus and deciduous fruit trees and vines. Send us a list of your wants.

Bergtholdt's Special Selection for Home Orchard **\$3.95**

Write for our list of combination offers for home planting and our free book on California Fruits. Address Box

CLINGSTONE PEACHES

OUR IMPROVED TUSCAN is preferable in every way to the common Tuscan in the following features:

- 1st—More regularly productive.
- 2nd—Perfectly round; uniform size and symmetry.
- 3rd—They do not split pit.
- 4th—They do not gum.
- 5th—They are fine grain, of superior canning quality and command a premium of from two to five dollars per ton over the ordinary Tuscan.

APRICOTS

There is usually a shortage, particularly of Apricots on Myrobolan root for planting on heavy loam or poorly drained locations. We have a fine block of Apricots on Myrobolan root in all varieties, as well as on Apricot and Peach root.

SHIPPING PLUMS

Every standard variety of Shipping Plums on Myrobolan root. Bitter Almond and Peach root. Let us have a list of your wants for prices.

PHILLIPS CLING PEACHES

Our Phillips Cling are of the true type and but one generation removed from the Phillips Cling first introduced. Very few are aware of the fact that the Phillips Cling, as commonly propagated, is deteriorating from the true type in the successive propagations.

ALMONDS

We have a fine block of trees on Bitter Almond and Peach root.

PEARS

We have a fine block of trees, well rooted and hardy, in Wilder, Lawson, Bartlett and all of the later standard fall varieties.

BARTLETT PEARS, as well as all of the standard Fall Pears, have this year made a good record for the California grower, as they do every year.

HAUSS CLING PEACHES

A seedling from Phillips Cling, and has all the desirable features of that splendid variety. Ripens immediately after the Tuscan, filling the intermission between the Tuscan and Phillips.

This is an opportunity to get 10 fine trees of choicest varieties of fruit delivered freight prepaid for only \$3.95. You can make your own selection or leave it to us and we will send ten best grade 4 1/2 ft. deciduous fruit trees including one grafted walnut.

Weavers of Speech

Upon the magic looms of the Bell System, tens of millions of telephone messages are daily woven into a marvelous fabric, representing the countless activities of a busy people.

Day and night, invisible hands shift the shuttles to and fro, weaving the thoughts of men and women into a pattern which, if it could be seen as a tapestry, would tell a dramatic story of our business and social life.

In its warp and woof would mingle success and failure, triumph and tragedy, joy and sorrow, sentiment and shop-talk, heart emotions and million-dollar deals.

The weavers are the 70,000 Bell operators. Out of sight of

the subscribers, these weavers of speech sit silently at the switchboards, swiftly and skillfully interlacing the cords which guide the human voice over the country in all directions.

Whether a man wants his neighbor in town, or some one in a far-away state; whether the calls come one or ten a minute, the work of the operators is ever the same—making direct, instant communication everywhere possible.

This is Bell Service. Not only is it necessary to provide the facilities for the weaving of speech, but these facilities must be vitalized with the skill and intelligence which, in the Bell System, have made Universal Service the privilege of the millions.

Little Stories of Success

No. 11

"Bankers Opinions regarding the tractor" is the title of table No. 2 in Bulletin 174 of the U. S. Department of Agriculture. The first question asked the bankers was: "Has traction farming had a favorable or unfavorable effect upon the farming industry in your vicinity?"

In California, where three-fourths of all the tractors in the State are Caterpillars, 95% of the replies were favorable. Conservative bankers almost unanimously voted Caterpillar farming a success!

Wouldn't a Caterpillar be a good investment for you?

We have other facts and figures regarding the comparative costs of animal power and Caterpillar power for farming. A postal will bring them.

WORN OUT LANDS

Written for the California Cultivator
By W. S. Guilford

WE hear a lot about the worn out grain lands of California where yields have been decreasing and operators of large acreages go broke.

But is it not more to be wondered at that the crop yield is as good as it is—when methods and practices are considered? There are good lands in California that grow fair crops and are not plowed but once in two or three or four years. When they are plowed the ground is barely "skimmed" four or five inches deep, and each year every straw left on the land after the grain has been threshed with the "combined", and every spear of stubble, is burned.

No humus is returned to the land from any source and the little top layer of soil that is plowed is worked over and over until it loses its open, mellow texture and becomes stiff and lifeless.

Surely there are few places in the temperate zone where nature is so kind—or unkind if the ultimate effect on a few generations of inhabitants is considered—to mankind as here.

Plow, seed, harrow, reap—this is one year's program. Then burn, harrow, reap another year and perhaps another like it. Then plow again—and so on.

The big, rich agricultural areas of the world have been successively mined by this system. Some have lasted longer than others, but sooner or later decreased yields—and the slow but sure working around of agricultural affairs—bring changes that eventually increase production.

Sometimes this comes because of the land getting a rest. After long years of injudicious cropping bankruptcy forces owner or tenant to stop putting in crops; native vegetation again fills the soil; roots and crowns and tops of plants decay; the soil grains are held apart; rain water penetrates more readily and to a greater depth; it is possible for more air and oxygen to reach more deeply into the soil; there is greater activity of bacterial life; more plant food is liberated—plant growth increases in luxuriance; and the land becomes capable of producing greater crops.

No new mineral elements of fertility have been added; food that has been locked up because of the bad mechanical conditions of the soil has been unlocked, and the land is worth more money.

A great many California soils of lowered productivity are not worn out in the sense that the principal elements of fertility are entirely exhausted. They may contain an abundance of minerals to grow maximum crops for many years, but these crops cannot be produced under the system of farming which renders these essentials unavailable to the plant.

Another thing that increases the productiveness of these abused but good California lands is a complete change in the system of farming. This has usually come with the development of irrigation, making possible

the production of crops that could be grown with little satisfaction with the ordinary rainfall.

An abundance of moisture available throughout the year makes it profitable to grow crops that fill the soil with roots, like alfalfa, and absolutely change its physical and mechanical texture. This system makes possible more live stock, more animal manures for the land and ever increasing crop making ability.

So that instead of lands called worn out being of little or no use to the community or state or nation they may be simply on the verge of some new or better system of farming that will make them more valuable than they have ever been.

LAND CREDITS

"Land Credits, a Plea for the American Farmer," by Dick T. Morgan, published by Thomas Y. Crowell Company, New York, at \$1.50 net.

This is one of the very best books we have seen on the financial question which is being so generally discussed. It is especially timely and is the book for today. It gives a review of the three bills now before congress; the commission bill, sub-committee bill and the senate bill. Criticism is made of each and the discussion enters into the subject in a most informing way. One of the strongest chapters is Chapter II, showing discrimination against farmers. From nearly 27,000 banks reports have been received showing that their total resources are about \$27,000,000,000. The capital stock of these same institutions is only slightly over \$2,000,000,000 and about the same amount is represented in surplus and undivided profits. In other words, slightly over \$4,000,000,000 investment carries \$27,000,000,000 of resources. These same banks have in loans and discounts and investments in stocks and bonds \$2,000,000,000 or, in other words, they are able to loan ten dollars for every one represented in the capital stock which the stockholders in the bank own. Of course then the credit business which these great institutions is conducting is done with the people's money, all of which is entirely proper, but to whom does this money go? As figures show, the banks have granted of this credit far more liberally to the city than to the country, or agriculture has been discriminated against. The report of the comptroller shows that our banks have loaned on lands \$542,000,000, while they have loaned on real estate, which is not farming lands, \$2,965,000,000, or five dollars have been loaned on urban property for every one on farming lands.

There is no criticism of the bankers for the practices which have prevailed but there is most earnest appeal in this book that in the future the greatest of our creative industries shall be given a fair show. Mr. Morgan, the author, is a native of Indiana, has lived much of his life in Western Kansas, and is now congressman from the eighth congressional district of Oklahoma.

We quote from Mr. Morgan's preface:

"When the sixty-third congress ad-

journed, March 4, 1915, I was confronted with a situation entirely new to me. Apparently I had nine months' vacation in sight; for, barring an extra session, congress would not meet again until December 6 following. Farm-credit legislation had been conspicuous before the sixty-third congress. The whole subject was postponed for the action of the sixty-fourth congress.

"I was disappointed in the recommendations of the commissions which went abroad to study rural credits, and I had reached the conclusion that congress should not enact into law the commission bill, the sub-committee bill, or the senate committee bill. I therefore decided I could best serve my constituents, my state, and my country by devoting the greater part of my vacation to the further study of the principles of land credit, and in preparing the result of my investigations for publication in book form."

There are 12 chapters in the book, touching upon crisis in land credit legislation, discrimination against the farmer, fundamental principles of European institutions, the three bills now before congress, adequate credit, economy, competitive land banks, interest, government aid, etc.

We believe with the author that the federal government must contribute a just share to the success which must come if agriculture is supported and encouraged as it should be. Mr. Morgan says:

"If the government shall refuse to guarantee the bonds issued by all our land banks, it can well afford to aid the farmers in building up a guaranty fund large enough to insure the safety of all our land-credit institutions. Thus the common reserve fund will unite our farmers in a common undertaking for the benefit of all; it will bind our farmers more closely to each other; and the participation by the federal government in contributions to this fund will bind our farmers more closely to the federal union, strengthen their love and appreciation therefor and enlarge their admiration for the principles of free government."

SORGHUM MOLASSES

Those of us who were born back in the maple syrup and sorghum country occasionally have a hankering out here on the shores of the Pacific for a taste of the old-time sweets. The Cultivator has referred before to the successful production of sorghum syrup in California, but for the first time we are now eating some genuine California made sorghum. It was produced by D. L. Wray & Company of Woodlake, Tulare County, and we will say that barring the "skimmings" which we used in barefoot days to get for taffy at the old Ohio sorghum mill—these to be had for the asking—we have never tasted anything finer than this Lake Brand of sorghum put up by Mr. Wray.

One of the nicest features of Mr. Wray's product is the attractive package. We presume he has larger packages but the one sent to the Cultivator office is a little "case" containing two five-pound cans of the syrup. On one side of the case is "Lake Brand Sorghum for Hot Cakes" and on the other side "Lake Brand Sorghum for Cooking." A view of Woodlake is shown on the label and "Lake Brand Sorghum, Guaranteed Pure" appears in large letters. We mention this at length for the reason that it is proof that markets may be created for many other California products if we

will look for those for which there may be developed a demand and then put them up in attractive shape. Attractiveness induces the look and taste and then quality must insure the future market.

We think the Wray Company will find large demand for their product. More, we hope it will prove, as we believe it will, exceptionally profitable.

Mr. Wray writes: "This is our second year in the business and we have just finished our season's run with an extra good crop. We are glad to say that our goods are selling very readily to merchants of this valley."

ENCYCLOPEDIA OF PRACTICAL HORTICULTURE

The "Encyclopedia of Practical Horticulture," edited by Granville Lowther and William Worthington, with the assistance of 200 specialists, published by the Encyclopedia of Horticulture Corporation, North Yakima, Washington, at \$22.00 on the monthly payment plan, or \$20.00 cash.

The four volumes which comprise this book are filled with a fund of information of value to every farmer. The book is written from the Pacific Coast standpoint. The greatest importance is apparently placed on the apple industry as the great fruit industry of the Pacific Northwest. Most of Volume I and a small part of Volume II is given over to the discussion of apples and the apple industry.

The editor says: "We have tried not to be technical. At the same time we believe we have been scientific in that we have aimed to make all of our teachings conform to the facts as scientists have discovered them. Where it was possible to do so we have expressed these facts in plain and untechnical language. Believing that thousands of fruit growers in this country, who are too busy to gather all this information for themselves, will be interested and profited by such a work, and believing that thousands who live in other parts of the United States will be interested in knowing the methods we employ for the production of fruits, proven by the prices they command to be among the best, we submit this work to the world."

The idea of the editors has been that the Coast—one of the greatest fruit districts of the world—should have its own treatise. The plan of the book is to set forth in their natural order steps and processes for propagating, maturing, harvesting and marketing commercial fruits and vegetables, with, of course, information as to selection of seeds and stocks, site, soil and climate. There is given a history of the origin of fruits and plants, with their physical and hereditary tendencies and environmental requirements. All topics are treated alphabetically, but in addition there is given a cross-index covering 24 pages, which adds materially to the value of the book.

STOP THAT SQUEAK!

The springs on an automobile become dry and rusty from water getting on them.

Use a spring leaf spreader, or jack the body up until the load is off the springs, and then force something between the leaves to open them. Make a paste of graphite and oil, and with a putty knife or common case-knife, spread the paste between the leaves. This will do away with the squeaks, and you will notice quite a difference in the riding.—R. A. Bradley, Colorado Agricultural College.

More HOP Profits More Bales per Acre

Hop Growers who have taken advantage of our free service department have found it profitable. They have made money through our advice. We have shown them how to increase the number of bales per acre. What we have done for others we will do for you. Write us fully and frankly. Let us know the exact conditions you are working under. Send a sample of soil and we will tell you how we can help you. You will not be obligated in any way. We want every Hop Grower to know all about

HOP

BRAND

Gaviota Fertilizer

How it increases land values while increasing the land's yield. We want to send you positive proof of the wonderful increases it has made. How it feeds the crops and improves their quality.

Read what Hop Men Say:

From a Grower in Sonoma County:—"After using HOP Brand for two years, I am thoroughly well satisfied with results both in production and quality."

Another Sonoma Hop Grower:—"I began using your HOP Fertilizer in 1911 and increased my yield from 180 bales to 378 bales."

From Sacramento County:—"I purchased HOP Fertilizer last year and have had splendid results."

Still Another From Sonoma County Says:—"HOP increased my crop from 8.36 bales per acre to 13.14 bales."

We will furnish the names of these men on application.

"The Care and Feeding of Crops"

is a little book that tells you in plain English some valuable truths about the correct way to put back into the soil those elements which the crops take out. It tells you how to increase the size of your crops and how to make your land more productive. Write today for a copy free.

LIMA BEANS IN VENTURA

Continued from Page 555

beans being planted in rows or drills. Harvesting begins about September 15 and in about three weeks, depending on the season, threshing may commence. The threshers this year raised their price, charging 30 cents per hundred pounds. Farmers of small tracts, often unable to wait for the thresher, do their own threshing by tramping. The cost is much less, in fact just about one-half that of machine threshing, but it is so exceedingly slow that very few care to employ this method. This season has seen the trying out of a small one-farm thresher. It has proved very success-

As yet the bean matured 110 days after planting is the best the planters have been able to do.

Mr. Lewis has not been alone in his effort to grow a finer and more productive bean, for many others are joining him in the work. And all are worthy of praise and reward, for he is indeed a benefactor who makes two beans grow where only one, half as big, grew before. One of these experimenters is Mr. J. N. French of Oxnard whose experimental plots are affording many interesting lessons. Mr. French who is the Oxnard inspector of the Ventura County horticultural commission, and Mr. A. A. Brock, the commissioner, extended to the writer

Plowing Bean Lands with Cable Outfits

ful and will be used more generally another year.

Referring again to Mr. Lewis, who first planted limas in California, both he and Mr. McAlister have passed on to their reward, but Mr. J. F. Lewis who, as a barefoot boy aided in planting those first seed in 1868, is still growing lima beans. They are vastly superior, however, to those first beans brought from South America, not because of the introduction of new seed so much as because of wise selection for both quality and yield. For

the courtesy of a ride through some of the richer of the bean producing sections, and the Cultivator camera was offered an opportunity of taking down a few scenes of the busy season in beandom.

Both ends of the season are times of anxiety for the bean producer. He wishes to plant as early as possible to secure a long growing season, yet with cold rains which may rot the seed in the ground, he has his problems. Again, at harvesting time he anxiously watches the clouds which

The tractor turns more bean land in Ventura County than any other form of power.

years Mr. J. F. Lewis has observed the behavior of these plants and their bearing capacity, also the quality and size of the product, and from the best plants he could find in the field he has preserved seed and made careful selection until the production per acre has been greatly increased.

Mr. Lewis told the story of the planting of those first beans as a small boy, and of his work with beans through all these years, as he sat on the porch of his home at Camarillo a few weeks ago. He told how he is still working to secure a 100-day bean.

may cause the loss of his entire year's work, in the meantime keeping an eye toward the hills over which at times come winds which may clear the field of all the beans piled ready for the thresher. This season has been an ideal one, nearly every bean in the county being threshed when the rains came. But at the time of our visit thousands of acres of beans were still unthreshed and from early morning till dark or later the hum of the thresher was heard. Some nights there is so much moisture that a few hours' morning sun is neces-

sary to fit the vines for threshing. Then it may be noon before the start, and an evening run, possibly up to midnight, may still make possible a full day's work, when acetylene or electric lights make most picturesque the busy scene.

The beans are sacked at the machine and later hauled to warehouses where recleaning and resacking makes them ready for market.

This season's beginning saw the association which has brought prosperity to bean growers for five years, making an endeavor to secure a greater percentage of the growers as members. Many had remained outside the cooperative organization and yet received the benefits of the cooperative effort of their neighbors. The injustice of this caused the association to issue an ultimatum that unless at least 75 per cent of the growers united the association would not market the crop. The 75 per cent did

and has outlined a plan. After referring to the general conditions of the industry and to the necessity for loyalty to the purposes of the new organization Mr. Farrand gives the following plan which will be discussed at a mass meeting of growers next Saturday at Ventura:

Plan of Organization

It does not seem practicable or desirable to the growers to form one central organization, for which reason the plan is to permit the growers in the vicinity of a centrally located warehouse to form local associations, which local associations will be affiliated together into a central organization. There will be, say, six or seven of these local associations in Ventura County.

Through the local associations is secured the personal contact with the grower, and the central association is in a position to adequately represent the general interests of all the local

associations into a central association for the purpose of cooperatively marketing and distributing the crop.

These purposes would be somewhat elaborated in drafting the actual articles. The number of directors would be sufficient to give all of the growers adequate representation, but not too large so as to be unwieldy. In the local association the growers in the articles would be authorized to vote either equally or according to a tonnage basis. A "one man one vote" plan is preferable from a purely cooperative standpoint, but frequently for local reasons it is essential to give the larger quantity of beans a proportionately larger vote in the association deliberations. Either way, however, may be successfully worked into the local association plan.

The Central Association

These local associations will affiliate themselves together for the purpose of forming a central association. This central association will likewise be incorporated under the laws of California as a cooperative, non-capital stock organization. Neither the local associations nor the central association will have a capital stock. Incorporation of the central association will be brought about by a representative from each of the local associations meeting to adopt articles of association or incorporation, which articles, like the articles of the local associations, will set forth, among other things, the name of the association, the purpose for which it is formed, its principal place of business, the number of its directors, as well as a statement as to whether or not the voting power of its members shall be equal.

Each local association is thus a member of the central association. Each local association appoints a person to represent it as its director on the board of directors of the central association, which central association thus has as many directors as there are local associations composing it.

The purposes for which this central association is formed would be carefully stated in the articles, but the following is a general though rough, outline as a basis for discussion:

To act as the agent or representative of the local associations composing its membership, and to provide for them and for the growers composing the local associations, the agencies and facilities through which the growers who are connected with the local associations may market and distribute their lima beans throughout the markets of the United States and elsewhere.

Continued on Page 583

J. F. Lewis of Camarillo.

Mr. Lewis is the oldest bean grower in Ventura County, having aided his father in the planting of the first limas received from South America. Mr. Lewis is shown in this picture sitting in his favorite chair on the porch of his home, with an outlook over thousands of acres of bean fields, many of which are under cultivation by his own family. Mr. Lewis is incapacitated from the physical work of bean growing but has remarkable knowledge of the industry, both in the matter of growing and marketing.

not come in and the association, true to its word, told the growers to look out for themselves. The "market" pricked up its ears, clipped off about an even dollar from quotations on its 1,200,000 sacks and Ventura County farmers fiddled while the "market" danced away with about a million dollars of their hard earned money.

That would have bought a lot of gasoline and things, but of course cooperation stands in the way of "independence" and prevents the producer from "selling when and to whom he pleases", also from "handling his business as well as some other man can handle it for him," etc., etc.,—in fact several et ceteras.

But the lesson of the past years is learned and at this writing better judgment is prevailing and a persistent and consistent movement is on for a new and effective Lima Bean Growers' organization.

We hope the 1916 crop of California limas will be handled cooperatively and that its returns will be such that more fine, new homes, such as those which are shown in this Cultivator, may be builded and that more pleasure trips to the wonderfully beautiful canyons and mountain lakes of Ventura County may be taken by bean growers.

PLAN OF ORGANIZATION OF BEAN GROWERS

In the matter of organization the bean growers are starting right in securing the best of legal talent. Mr. George E. Farrand, who has been for several years adviser for the Fruit Growers' Exchange, has been retained

associations. This plan, then, involves a consideration of the grower, the local association and the central association, which is now considered.

The Grower and the Local Association

As above stated, the growers within easy access of some central warehouse will associate themselves together for the purpose of forming a local association. This local association will be incorporated under the incorporation laws of California as a non-profit, non-capital stock cooperative agricultural association. Incorporation of such local association is brought about in this way: The growers in each of said localities will get together, select a committee on incorporation, which will thereupon prepare articles of incorporation, setting forth the name of the association, the purpose for which it is formed, the place where its principal business is transacted, the number of directors, which must not be less than three, and may also set forth certain other legal requisites.

The purpose of the local association could be sufficiently well stated at this time to be about as follows:

To provide the agencies and facilities through which the growers of lima beans who are members of the association will be permitted to market their crops of lima beans, the association to have for that purpose power and authority to enter into appropriate marketing and other contracts and to affiliate with other local associations organized for similar purposes, and to unite with such

Sensible Gifts of Furniture!

—Beautify the Home; and Delight the Entire Family!

In Barker Bros.' home furnishing store are thousands of needed articles, appropriate for gifts—all made for real comfort and service in the home.

You'd be surprised to find so many really wantable articles at prices ranging from a dollar or so up to as high as you would care to go.

When you come to Los Angeles on your holiday shopping trips be sure to visit Barker Bros. If you can't come to the city write us concerning gift articles and furnishings for your home.

The Lawn and

Flower Garden

CALIFORNIA GARDENS

Written for California Cultivator
By Ernest Braunton

OMETIME we shall develop a California style of gardening. One recognized authority in the East, but who has never visited California,

once wrote me that he thought we should copy the Italian rather than the Atlantic seaboard style of gardening, on account of the similarity of climate. But my opinion is that we should study our own needs and comfort and if so we shall follow more closely the British, for they build for comfort above any other people. The English live in the garden and out-of-doors more than we do in California.

The Italian formalism is too harsh and cold for Californians even if we do have nearly perpetual summer. The sun shines here so much that concrete, plaster, marble and pressed brick are too glaring. Even our mission style of architecture needs some softening influence such as fragile vines. The old mission buildings are mellowed by time, but a new building of the same type is too severe and obtrusive without aid from vine and bush and tree. Personally I think white buildings and white roofs are much out of place in a land of perpetual sunshine. Let us have many arbors, pergolas, and covered seats in California; and many uncovered seats too, for there should be comfort on every hand, and close at hand. Let us have arbors large enough for dining rooms—and use them as such. We may also utilize some as sleeping rooms, a custom not uncommon in the southern end of the state. Let us have tennis, basketball, croquet, bowling and games of all kinds. Build aviaries and other quarters for pets—we do not have to keep them tenantless as is a necessity east of the Rockies for almost half of each year. Look first to comfort, then to instruction and entertainment.

Garden Now

If ever there was a time for active gardening it is now. The copious rains have so soaked the soil to a great depth that all gardening processes should at once proceed and with all possible haste be finished. One of the first autumn crops to plant lies in the bulbous class—bulbs of almost every kind—and they should go into the soil at once. Only tuberous-rooted begonias, dahlias, elephants ears and things of a tropical nature should be held out; these are best kept until March or April, when both air and soil are warm enough for heat-loving plants. All Dutch or Holland bulbs should be put into the soil at once, also dwarf gladioli. Even the first planting of the large gladioli may be made before the new year.

Harmony in Vine and Host

To those who would like to study harmony in the partnership of vine and host, plant a white-flowering wistaria on a white-flowering locust tree. Both belong to the same family and very closely resemble one another except in habit. Both have pinnate leaves and pea-shaped flowers. The

common lilac-colored wistaria grows so vigorously that it should never be placed on a living tree except the latter is of good size, but the white variety is of much weaker growth. In planting vines on trees choose the largest trees you have and use vines with foliage similar to that of the host plant.

Holding Sand Dunes

Had I a ranch "by the side of the sad and sounding sea" I would have a plantation of trees and shrubs almost down to the water's edge. When Golden Gate Park was reclaimed much of it was shifting sand dunes dominated by fierce winds blowing constantly. Furrows were deeply plowed in the sand and one of the sea grasses, or beach grass, was planted therein, all at least a foot deep. This grass was *ammophila arenaria*, also known as a *calamagrostis*. Even these were blown out by the gales and much was replanted again and again. When the whole tract had grass growing upon it, brush fences four feet high and 300 feet apart were built across the wind. In the shelter of these were planted Monterey pine, Monterey cypress, albizzia, acacia and tamarisk. As these grew stable manure and rich soil was spread all about them and eventually the dream of a park became a reality, and today is positively a wonder.

Buy Local Seeds and Plants

There is little satisfaction to be gained in controversy over seeds and plants with Eastern dealers who may only be reached by mail. It is bet-

ter to purchase at home where some of the purchase price may indirectly return to your purse and where the dealer is available in case adjustments of any nature are found necessary. More than that plants and seeds grown in local territory are generally better suited to local conditions and therefore more satisfaction is assured. Then, too, local seeds should be fresher, better preserved, being handled less, and the same is true of plants. The latter are often in very poor condition on arrival from New York, Philadelphia and Eastern points of distribution. No good accrues from packing plants for transit even though confined but for a day.

Botany

Someone asks how many kinds or divisions of botany there are. Systematic botany is an enumeration of plants classified according to their various degrees of differences or resemblance, or the study of kinds of plants. The study of form and structure is structural botany, and combined with vegetable physiology is called physiological botany. The study of the distribution of plants over the earth may be termed either geographical botany or botanical geography. The study of plants of former times is fossil botany. The words botany and botanist are very carelessly used. So many persons are alluded to in the newspapers as botanists that are not in any sense. I have never known a gardener, florist, nurseryman, or park superintendent who was a botanist, and indeed I have known but very few botanists at all. I am not one myself, though often so-called because having more botanical knowledge than those in the crafts above enumerated. But some knowledge of drugs and their uses does not make a doctor of medicine any more than a house painter is an artist in oil as we know the latter.

Small Fruits

Vegetables

THE MARKETING PROBLEM

Written for California Cultivator
By Percy L. Edwards

HE Imperial Valley has completed the season's shipment of cantaloupes and it is a record breaker. The officials of the several packing houses show shipments for the season amounting in the aggregate to 4880 cars. This exceeds the output for any previous year by over 400 cars. When it is remembered that about 360 boxes are loaded in each car, the reader may form some intelligent idea of the enormous size of the crop, about 1,493,280 boxes. In the picking season it is not an unusual sight to see boxes filled with this melon standing along the side of a field a quarter of a mile in length, sometimes more.

The cooperation of the agricultural department has aided the growers the past season in distributing the big crop. An even distribution has prevented a glutting of the market and assured a fairly average price. This result could not have been obtained had it not been for the extending of market limits beyond those heretofore at hand. Indeed, the matter of marketing of crops produced is quite the most important question with which we have now to contend.

The peach growers of the San Joaquin Valley did not harvest the big crop of freestones because there was practically no market to which the grower could ship or deliver them. And yet, if one goes into a retail store where peaches are kept for sale he is asked a price which hardly varies

during the season. The grower would make a big profit if he could get 50 or 60 per cent of the price paid by the consumer. This is a peculiar condition of things. As further illustrating this condition in which the grower finds himself, the story is going the rounds of the experience of a gardener just outside of a big city in the East. Lettuce was produced for the city market in large quantities. About 50 barrels of the choicest quality of finely headed lettuce were sent in one shipment to the commission house and the returns awaited by the grower with considerable confidence. When he received a check for \$1.60 as the proceeds of his shipment he quite naturally began an investigation. The commission house made a statement of account that showed square dealing on their part, but because the lettuce could not be offered to the trade soon enough much of it spoiled on their hands. The grower went out into the markets where the consumers of vegetables are in the habit of going for such things and here he found that lettuce was in demand and selling at fairly good prices. This latter condition seems usually to be so. There is always a strong demand for fresh fruits and vegetables if the grower can get near enough to the consumer. And this is the problem that now confronts the growers of fruits and vegetables and many other farm products of California and other sections of the country. If a satisfactory scheme is devised to bring the producer and consumer into closer relations great benefit will result to both.

Economics

on the Farm

CALIFORNIA PRODUCERS' EXCHANGE

DURING the Fruit Growers' Convention is Visalia, a meeting was held by those interests in the California Producers' Exchange. This meeting was called at the suggestion of Mr. Sheridan W. Baker, vice president of the California Cured Fruit Exchange. From minutes supplied by Mr. Vernon Campbebel, manager of the California Growers' Association we take the following:

The purpose of the meeting was to consider the advisability of the organization of the central bodies of the various cooperative associations throughout the state. Mr. Baker outlined the purposes of the proposed organization, stating that such an organization should be beneficial to the various associations. He felt that the different associations throughout the state might be mutually helpful in solving the various problems that present themselves from time to time and laid especial stress upon the problem of marketing. He also suggested that such an organization should work in close harmony with the state market commission and with the horticultural commission. He felt that great good would come to the producers through the benefits to be derived from such close association with these state commissions. He reported that he had communicated with the managers of various growers organizations, many of whom were unable to be present, and had received favorable comment and much encouragement in regard to the proposed organization.

There was a general and lengthy discussion of the marketing problem and the following resolution was passed: Resolved, That the president call a meeting of the authorized representatives of the central organizations of the various cooperative associations throughout the state some time during the month of January, and that the purpose of the meeting shall be to consider the advisability of incorporating a permanent organization having for its object the mutual benefits of its members and the solution of marketing and various other problems that may present themselves to the members from time to time.

From the proposed plan of organization we note that:

"The purpose of this organization is to create a more efficient and direct system of distribution and sales than now obtains in the handling of California products, the object being to return more money to the producer by widening distribution, increasing consumption, reducing middlemen's profits and lowering the price to the consumer.

"Membership shall be composed of the central organizations representing the various producers' cooperative associations throughout the state.

"Membership fee of each association shall be \$1000. The California Producers' Exchange shall use said fee as a permanent capital fund, and one-half of one per cent of the gross receipts from the sale of goods shall be retained by the exchange to go toward

building up said fund. Said fund to be used for permanent investment in the extension of direct sales system and in assisting to finance the pack of the various member associations.

Method of Distribution

"City distribution: In all cities there are public warehouses and a warehouse shall be selected which has facilities for handling both green fruits and vegetables and non-perishable products. We find these warehouses are in line for this new movement, in fact anxious to cooperate. Their charges are very reasonable, being on a tonnage basis. They can handle our business much more cheaply than we could by owning our own warehouses. Our local offices should be maintained in these warehouses. Bonded agencies should be established for wholesale and retail distribution throughout the entire city. These agencies may be semi-jobbers or retailers located at advantageous points. Their bond deposited with the exchange should be sufficient to cover any goods that may be carried. All deliveries made to them should be on 30 days billing. Deliveries can be made to these agencies at very low rates, either by warehouse companies or trucking companies which we find make a practice of charging about five cents per 100 pounds on deliveries from one to three or four tons and seven and one-half cents per 100 pounds on less than ton deliveries, the minimum delivery charge being 25 cents. These agencies, or sub-warehouses, would be able to take deliveries of from one ton and upwards as they will be handling all classes of products. A fixed price in case lot or original packages should be made to all classes of buyers, whether retailers, bakeries, hotels, restaurants or consumers, for the purpose of encouraging the small buyer to buy larger quantities. All retailers throughout the city who send their own trucks to the central warehouse should be allowed a discount on the price made by the local agency in their district. Our plan is to allow the local sub-agents ten per cent on original package sales, which shall always be for cash; or, if not for cash, extension of credit shall be assumed by the local agent. On all retail sales made either by the agent or the retail dealers, the profit shall be whatever is decided by the exchange to be necessary. For instance in canned goods it should be between 25 and 30 per cent. A dozen cans selling at \$1.35 by the case would retail at a price not to exceed 15 cents per can. These goods retail now at from 20 cents to 25 cents. A dozen cans selling at \$1.80 would retail at not to exceed 20 cents per can. These goods are now retailed at from 35 cents to 40 cents. As the object is to reduce the price to the consumer and to increase consumption, our exchange will not object to a reduction, and a rise in price will be controlled by the retail sales price of the local agencies which will be figured exactly on a 25 to 35 per cent margin; goods being sold at a price of odd cents, possibly 14 to 19 cents per can.

"Wherever possible, carloads of

canned goods, dried fruits, citrus fruits, fresh deciduous fruits, vegetables, etc., will be shipped direct to the local warehouse agencies in these towns; but where the consumption of a given product is not sufficient to absorb a carload shipment, which condition might arise in such a product as almonds, the car would be shipped direct to the nearest city warehouse and there broken and reshipped to the warehouses in the outside territory. This would add slightly to the freight haul cost but otherwise would not entail an additional expense. Shipments to these local warehouse agencies would be carefully made up at this end so as not to overstock the smaller market on any one item. Should the local agent find that he is going to have a slight excess of stock in one line he will ship these either to the city warehouse or to one of the nearby agencies as directed from the exchange office. We find that these local warehouses are willing to handle our business on a ten per cent basis, selling to either retailer or consumer. They will bear all cost of handling and make all collections without additional expense to us. In fact, we find these warehouses in many places are already doing this sort of business in other lines.

"To inaugurate this plan we should confine our efforts to a definite territory, say the states of Iowa, Minnesota and Wisconsin.

"Practically all of the banks in the large cities throughout the country are prepared to advance money on warehouse receipts, and shipments made in any quantity to our warehouses throughout the country may be used as a basis of security for loans. This money can be advanced to the grower if desired. Our California banks are also accustomed to advance money on warehouse receipts, and if such an organization as outlined is perfected the banks will feel much more inclined to make such advances than at present. Eventually the sinking fund will produce an enormous reserve capital which can be used for this purpose."

GARLIC FROM SEED

Mr. H. M. Starr of Van Nuys comes to our office with garlic seed which a plant produced for him during the past season. The impression prevails that garlic does not reproduce itself by seed but by sets or leaves. As to the germinating power of these seeds Mr. Starr is unable to say, although he is prepared to test them out during the coming season. Perhaps this strain of seed may lead to more satisfactory and more economical production of garlic, which has been exceedingly high-priced during the last season.

STICK TO THE OLD CROPS

Although a large amount of money is spent annually for the importations of crude drugs, and the extermination of a number of valuable native drug plants is threatened, government specialists do not believe that the growing of drug plants offers any unusual opportunities for profit to the American farmer.

Drug plants are subject to the same diseases and risks as other crops and, in addition, knowledge of the best methods of cultivation and handling is less general than in the case of other and better known crops. In order to have the cultivation of drug plants financially successful in this country, the introduction of improved methods and the extensive use of machinery is probably necessary. Under these circumstances the natural tendency will be to increase the production in the interest of economy.

The demand for many drug plants, however, is so limited that if large areas are brought under cultivation there is considerable danger of over-

production. Prospective growers are urged, therefore, to acquaint themselves with market conditions before investing any considerable sum of money in this way.

Pull 100 Stumps A Day—With The Hercules

YOU can clear an acre or more of stumps a day. No stumps can resist the Hercules. Doubles land value—enables you to make \$1200.00 on 40 acres the first year after stumps are out—and \$750.00 in crops every year after. Get the proof. Why not?

Write Us Now
Book tells all the facts—shows many photos and letters from owners—tells all about the many Hercules features. We'll also quote you a special money-saving price on a proposition that will interest you. Address:

Thursday, Dec. 9, 1915**OUR ADVERTISERS RELIABLE**

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THE CULTIVATOR

"Some one has said that he who succeeds in producing a new variety of fruit is a public benefactor. He who takes this new fruit and successfully cultivates it and supplies the needs of the human family is even a greater uplifter."

The cultivation is not nearly so attractive and fails to secure for the cultivator the appellation of wizard, but it does the world vastly more good.

SHIPPING RIPE FRUIT

Some of the orange growers in the earlier districts have become restive under the slow shipment of oranges this season. Hardly an orange went to the Thanksgiving market, and a comparatively small number will go to the Christmas and New Years market, but there is one satisfaction in the larger viewpoint, and that is that such fruit as has gone is of a quality which creates a taste for more. We believe the slower shipment will be well compensated for by the greater demand of the later season. If the orange market lasted only a few weeks instead of months and years we could deceive the public with profit. As it is, however, honest oranges is the best policy.

A S OTHERS SEE US

Some most interesting reading is given in the article in the last issue and concluded in this, written by Mr. George T. Powell, an expert horticulturist who has made it his life work to give advice on horticultural subjects. Mr. Powell's experience has been almost entirely in New York or nearby states. A few months ago he made his first visit to California, and his life time training in horticulture makes his opinion of California fruit growing conditions most interesting.

Mr. Powell is the father of G. Harold Powell, formerly of the United States department of agriculture but now manager of the California Fruit Growers' Exchange, and he would naturally see much of value in this great organization, but we submit his opinion of that organization as expressed in this article as clean-cut and of value, especially in some of the points he makes as to its influence upon the fruit industry.

MORE EXPOSITION

The decision finally reached to continue the San Diego exposition another year will give opportunity to a great many to see the most beautiful exposition ever built. The management has already arranged to have many of the largest foreign exhibits at the San Francisco exposition moved to San Diego. These include the exhibits of Italy and possibly of France and many other of the most educational. It is thought the buildings now on the San Diego grounds may be sufficient to house all of the additional exhibits, but the management promises to give all the housing room which may be required. It goes without saying that some of the Zone attractions will be transferred to the Isthmus. Joining with San Diego is Los Angeles and many other Southern California towns which are lending encouragement in a most substantial way. This will bring many visitors to California during the entire year.

MORE TAXES

Now comes the president with his demand for a tax of one cent per gallon on gasoline and 50 cents per horsepower on automobile and internal explosion engines, also for a stamp tax on all bank checks and on every ton of iron and steel manufactured. The treasury is becoming empty, and the \$65,000,000 or \$70,000,000 which he proposes to raise by the above mentioned taxes will be acceptable. It is perhaps better to put these taxes upon our own people, who are able to pay them, than on the producers of lemons on the Mediterranean, of walnuts in France, and of products of other nations, but to the ordinary selfish American it does not appeal as businesslike or reasonable. Not only have lemons been given entrance to this country during the past year so as to discourage every lemon grower, but now the engine that pumps the water to irrigate the groves, also its fuel, must be taxed to give still greater advantages to the foreigner.

NO HELP WANTED

The state commission of immigration and housing has issued a statement to baggage car tourists and even to the thoroughgoing workingmen who are looking toward the Pacific Coast as a place of great labor opportunities, in effect that:

"If you are looking for work or charity you will not find the former in California and you will find the latter only through hard labor on the roads or rock piles. California is determined to apply the work test to protect itself from the influx of unemployed and unemployables."

California needs more expert help, at least at times, but to properly distribute and care for it, it must be selected with greater care than is the mass of so-called workingmen who come to this country during the cold

season of the year. California climate is as attractive to the undesirable element as to the intelligent and energetic, and the handling of this class of people has proven a problem in all of the larger towns of the state. It is to be hoped that conditions will improve so that the labor problem will settle itself within a short time.

FIVE CENT PRUNES

In May the prune growers of the Santa Clara Valley got together and decided that five cents was the right price to receive for their season's crop. But a lot of growers were willing to sell, or at least did sell, for less than that figure, and millions of pounds were shipped out at low prices. The wise grower this year is the one who held. Now the prune growers are considering the appointment of a committee to aid in steadying the prune market for 1916. The 1915 committee is to report at a meeting to be held about the middle of January. In an address signed by Chairman Bone and Secretary Shelley of this committee we note:

"It is up to the growers as a whole to determine whether for the coming year they will allow their fruit to be sold in advance by those having no interest in it and then weakly allow themselves to be bulldozed into taking any offers made them, or whether they will decide upon some reasonable minimum price and then hold firm for that price."

"Those growers who adhered to the price set by the May meeting in spite of discouragements have been fully justified in their stand and are now reaping their reward. They are getting the price they held for."

BEAN GROWERS ORGANIZING

"A generality of statement is insufficient; the grower should have a report in permanent form to take home and read over", declares George E. Farrand, attorney for the California Fruit Growers' Exchange, whose services are now secured by the bean producers to aid in the formation of a new cooperative bean marketing association. Mr. Farrand has outlined a plan of organization, part of which appears on another page of this Cultivator. With this he has issued an explanation of his plans, calling attention to the necessity for cooperative effort on the part of the growers. The bean growers have lost hundreds of thousands of dollars, possibly more than a million, by not being organized during the past season. The one season's losses would doubtless cover the expenses of a cooperative organization for dozens of years to come, but the lesson, though severe, has been of value. That necessity is the mother of cooperation is as true as it is of other things of great value which have been secured by the people of this earth. It seems impossible to inspire the human race to do what it should, or at least to live up to its best, without being driven by necessity, and once the necessity has driven us to successful effort we are prone to forget.

In his appeal Mr. Farrand says: "If the growers will contribute to such an organization both their brains and their beans, and not throw the entire burden and blame of its management upon the board of directors, it would seem that an association could be built up which would successfully handle the crops of its grower members."

Not only is necessity a potent factor in successful cooperation, but the brains to which Mr. Farrand refers. It is a trite but true saying that only intelligent growers can cooperate; cooperation calls for a large enough view of commercial transactions to permit the grower now and then to sacrifice a bit in order for the entire industry to succeed and in fact for his own permanent success. All honor to the bean growers who are making this effort for the benefit of the community and their own pocket books.

Agricultura' N tes

About two-thirds of the 1915-1916 crop of oranges, mandarins and citrons has been destroyed by a recent plague of locusts.

Appointment of Chinese commercial attaches to Great Britain, Japan, Russia, France, Germany, Belgium and the United States is being considered at Peking.

Japan has harvested an immense rice crop which has lowered the incomes of the rice farmers and has also cut down the prices on beans both in Japan and Manchuria.

Careful inquiry in Southern France shows that the outlook for next spring's olive crop in that district is very unsatisfactory. Prices of olive oil in consequence are very high.

The sugar crop of Java is again poor this year. This makes the fifth poor year in succession for cane growing. The trouble has been caused by the dry weather in the months of November and December.

There is a general movement in the Philippines to extend sugar cane planting. The local bureau of agriculture is endeavoring to acclimatize an Hawaiian variety of cane which is much superior to the native variety.

Citrus growers of Alabama, Mississippi, Louisiana and Texas met in Mobile, Alabama, the middle of November to lay plans for uniting with the California growers in their request to congress to take up the citrus canker fight.

An advertising campaign has been started by the growers of all fruits in Porto Rico, especially of citrus and pineapples. All towns of 15,000 or more population in the New England and Atlantic Coast states will be covered by this campaign.

The government of New South Wales has purchased trawlers to supply fish to purchasers at low rates. Now the municipality of Sydney has established a market with cold storage equipment where the fish may be received and kept in proper manner.

A revival in hemp growing is reported from Kentucky. This year's crop is estimated at 8,000,000 pounds, against 1,600,000 last year and 6,500,000 in 1909. Wisconsin also increased its acreage. New machinery invented for harvesting and spreading the straw has proved successful.

Kansas builds eight silos a day. Reports to the state board of agriculture reveal that in the year ended February 28, 1915, there were built in Kansas 2559 silos, or eight for every work day. There were 9695 silos in the state altogether. Every county of the 105 has one or more. Sedgwick was at the head with 372.

An ideal home exhibition was opened in October in Sydney, the capital of New South Wales, Australia. A model house costing £700 (\$3406) was built and furnished, with the idea of showing a home requiring the minimum of work by the housewife and the maximum of beauty and comfort. Many rooms were also built and fully equipped by the firms exhibiting.

That South America has resumed her normal demand for agricultural implements from the United States is shown by recent export statistics. Large consignments of iron and steel have also been shipped lately to South America, while the exports of tin plate from the United States to South America during the summer of 1915 show an enormous increase over those of last year for the corresponding period.

Agricultural News Notes

of the Pacific Coast

Northern California

Practically all the rice is in the warehouses.

Wild geese are very plentiful in the upper Sacramento Valley.

Butte County will receive in excess of a million dollars for her rice.

Canned goods from Sacramento canneries is moving to Eastern markets rapidly.

The rush of raisins to the packing houses is practically over. Many packing houses are already closed.

There will be large plantings of prunes in the district about Willows, Glenn County, the coming winter.

Glenn County farm bureau centers will hold meetings at Cotora, December 13, 14; Jacinto, 16, 17; Orland, December 20, 21.

California now has 161,350 automobiles for which the state has received this year \$1,941,774.50.

Lyman C. Byce of Petaluma has been elected president of the California branch of the American Poultry Association.

County Horticultural Commissioner Hecke of Yolo is working to make more uniform the horticultural laws of the state.

Rice growers are asking that the mud hen be stricken from the list of protected birds as it is developing a strong hankering for rice grains.

Representatives of the Peach Growers' Association have addressed growers in Tehama County urging them to join in the association movement.

The Pomona Grange of Sonoma County will meet at Sebastopol December 11 for an all day meeting. The chief topic of discussion will be rural credits.

Secretary Shear of the West Coast Potato Association is inspecting yields of potatoes grown by contestants for the \$100 prize offered by the state horticultural commission.

The Nevada County farm club has taken up the matter of holding a potato convention at Grass Valley some time in February, in order to awaken interest in potato growing.

The California Almond Growers' Exchange has greatly increased its membership during the last season. Good returns will be made to the members as a result of this season's marketing.

The state board of health has served notice on the towns of Ukiah, Cloverdale, Healdsburg and Guerneville that they must cease dumping sewage in the Russian River or its tributaries.

Armed with rifles, poisons and traps, a squad of 50 men under the direction of the state board of health is waging a war of extermination on rabbits and coyotes in Lassen and Modoc Counties.

Placerville has an extensive business in the shipment of holly, or red berries, for Thanksgiving and Christmas decorations to San Francisco. Parcel post has facilitated the delivery of these berries.

Central California

Belated tourists in Yosemite Valley have had some trouble in getting through the snowdrifts.

The Terra Bella Irrigation District has received its certificate of incorporation from the secretary of state.

One sale of dried peaches was recently made at Selma on a four and three-quarter cent basis for a 40-ton lot.

A 2500-acre tract near Merced has just been seeded to alfalfa by the Crocker-Huffman Land and Water Company.

The Modesto Farmers' Union recently held a meeting at which an address was made by Mr. Crowe of the national union.

Dairymen of Kings County are averaging \$150,000 monthly on their cream checks. There are close to 17,000 cows in Kings County.

Lindsay orange growers are planning to make one of their finest exhibits at the National Orange Show to be held in San Bernardino next spring.

The state central committee for the proposed Million Dollar Peach Growers' Association is planning to open up a campaign in the Sacramento Valley peach belt.

A half million dollar corporation has been organized to develop the old Gray Brothers' ranch between Oakdale and Knight's Ferry in Stanislaus County, to make it one of the prize dairy farms of the state.

S. J. Vincent of Porterville who shipped 100 lambs to Los Angeles realized an average of \$6.33½ each, this being the highest price Mr. Vincent has received in the 20 years that he has been in the business.

Prune growers of Santa Clara Valley who have held for five cents are gratified at the present market; many sales are being made on the five cent basis. More than 50,000,000 pounds have been held for export.

Forest rangers of the Sierra national reserve are felling Christmas trees that will be used in Fresno's municipal Christmas celebration. Work has already been started on the 5000 stockings that will be hung on the trees.

California, agriculturally and horticulturally, was awarded 503 prizes at the Panama-Pacific. Seventy-seven prizes were won by the San Joaquin Valley Counties Association. This same association also won 24 prizes in San Diego.

The annual show of the Stanislaus Poultry Association was held the first week of the month at Modesto. Several birds were exhibited that had been shown at the Panama-Pacific in San Francisco. The pigeon and rabbit classes were especially well filled.

Only 8000 tons of raisins are now in the hands of growers, according to the statement made December 1 by President Giffen of the Associated. President Giffen estimates the entire raisin crop of the state at about 120,000 tons. The Associated will handle all but 28,000 tons of this.

Southern California

The dried apricot market is beginning to show some activity.

Orange County sugar beet growers were tendered a banquet by the management of the Anaheim sugar factory.

Santa Paula reports a slow movement of beans, with seed beans apparently in greater demand than any others.

Plans are practically completed for the conveyance of the irrigation system of the Imperial Valley to the irrigation district.

The Claremont Pomological Club will hold a picnic meeting at the citrus experiment station at Riverside next Saturday.

Ventura's walnut crop has practically all been moved from the packing houses. Shipments are now being made to Los Angeles.

The Indian Hill Citrus Association is building a pre-cooling plant and the San Dimas Orange Growers' Association is about to let a contract for a \$50,000 pre-cooling plant.

The LaVerne Orange and Lemon Growers' Association is making payments to members on the final pool of Valencias. The average price is \$4.25 per cwt.

The last meeting of the Covina Valley Farmers' Club was addressed by Prof. Vaile of the citrus experiment station at Riverside on Pruning of Orange Trees.

Prof. H. S. Fawcett of the University of California has been inspecting walnut orchards in Ventura. This work is preliminary to a state wide fight against walnut blight.

The meetings of the San Diego farm bureau through December will take the nature of demonstrations. Mrs. M. V. Davenport of the state university also will give talks on home economics.

The bean growers of Ventura County will meet on December 11 at Ventura to take definite action on the plan of organization submitted at the last meeting. This plan was presented to each local district for action.

Paxton & Shattuck of Los Angeles have recently sold 2000 head of stock cattle in the Los Angeles market. Twenty-five hundred more are to come on between November 15 and the first of the year. The Shattuck ranch at Lankershim is the home of pure bred Duroc-Jersey swine.

Farm Adviser Parker of Ventura County announces the following meetings during December: Ventura Avenue, December 3; Fillmore, 6; Oxnard, 8; Camarillo, 10; Nordhoff, 13; Satcoy, 15; Moorpark, 16; Bardsdale, 20; Mound, 21; Simi-Santa Susanna, 22; Santa Paula, 24; Somis, 27.

At a conference recently held at San Francisco between directors of the Imperial Irrigation District and representatives of the Southern Pacific Railway definite agreement was reached to give to the irrigation district complete control of the irrigation system of the old California Development Company.

The Coast

Seattle potato growers are finding buyers less active than earlier in the season.

Chandler, Arizona, shipped five tons of dressed turkeys for the Thanksgiving trade.

The cattle market of North Portland, Oregon, reports a jump in price on steers to \$7.25.

The Portland Union Stockyards recently entertained a large number of stock growers from Estacado.

An order for 200,000 barrels of flour for shipment to France and England was booked last week in Portland.

Hood River, Oregon, has shipped 48 cars of pears, d'Anjous and Bartletts, being the principal portion of the crop.

Kennewick, Minden County, Washington, shipped during the last season 400 cars of strawberries, pears and asparagus.

A regular freight and passenger steamer service has been established between Beaumont, Texas, and Tampico, Mexico.

The Fifth Annual Pacific International Live Stock Exposition is now being held at the Union Stock Yards, North Portland, Oregon.

A call has been issued for the 19th annual convention of the American National Live Stock Association at El Paso, Texas, January 26-27.

During the 1915 season the cannery at Hondale, Mimbres Valley, New Mexico, made its record for one week's run with 13,000 cans.

Idaho and Utah sugar beet producers are to receive a bonus of \$35,000 because of beets running exceptionally high in sugar content.

Farmers of Douglas County, Oregon, realized over \$30,000 from turkeys sold for the Thanksgiving market. The average price received by the growers was 20 cents per pound.

From Twisp, Okanogan County, comes the report that most grain farmers in that vicinity are holding their grain for higher prices, less than 20 per cent of the crop having been marketed.

Exports of apples to Europe from Pacific Northwest ports will be very limited this year. One of the largest fruit associations reports that up to the present time it has exported only seven cars to Europe.

Washington's output of apples for 1915 is estimated by the United States commercial agent in that district at 7,092,000 boxes. The state's apple production during 1914 was more than 1,000,000 boxes more.

The Arizona agricultural experiment station is urging irrigators in that state to unite in the installation of pumping plants, making one large plant do the work of several smaller ones, with greater economy.

Oregon apple growers are immensely peeved at one little worm which happened to be in the apple which the judge in the apple class picked up at the Panama-Pacific Exposition which threw the balance in the favor of Washington.

THE LICHEE OF CHINA

By Consul General F. D. Cheshire,
Canton, China.

The lichee (*Litchi chinensis*), one of the most widely known fruits throughout China, is produced in South China, chiefly in the provinces of Fukien and Kwangtung, but also in Szechwan. A small quantity is grown in other southern provinces, but none whatever in the north. It is said that lichees grown in other than the three provinces named are inferior in quality and almost unfit for edible purposes. This report will be confined to the lichees grown in Kwangtung province.

The principal lichee producing districts in Kwangtung province are Namhoi, Pun Yu, Tsang Shing, and Tung Kun. Some lichees are grown in the Heungshan, Shuntak, and Samshui districts, and while they are produced in abundance in the Yeung Kong and Shui Tung districts they are of inferior quality.

Fruit Deteriorates Rapidly When Picked

The fruit of the lichee tree when plucked rapidly deteriorates and can be kept in its original state for only three days at most. A plan has been adopted for preserving the fruit by storing it in bamboo after sprinkling with a weak salt solution and sealing both ends of the bamboo with clay. In this manner the fruit remains fresh for about two weeks, allowing of its being exported to Shanghai and Peking and ports on the Yangtze River.

Dried lichees are very popular in foreign countries. The fruit is dried in two ways—by sun and by fire. The sun-dried lichee commands the better price, it having a finer flavor than the fire-dried fruit. There are but two or three species of the lichee that are suitable for drying purposes, viz, the "no-mai-chi," the "kwai-mi," and the "wai-chi."

The purchase of lichees by the wholesale dealers from the producers is largely one of speculation, the former bargaining with the latter for the fruit during April and May, while the trees are yet in blossom, a certain amount being agreed upon for each tree. If the tree is unfruitful the purchaser must suffer the consequences. The actual quantity of fruit produced annually is a difficult matter to ascertain accurately, but from information received from the lichee growers the total amount of lichees annually produced in the Kwangtung province is estimated at 1,500,000 pounds.

Cultural Methods

The selection of suitable soil for the planting of lichee trees is most essential. Alluvial soil lying along the banks of fresh water streams is to be preferred. A soil composed of sand and mud in about equal proportions and about six feet above water is considered ideal. The lichee tree's two deadliest enemies are salt water and cold, and for this reason it is difficult to grow lichee trees even in South China. An abundance of manure is essential if the tree would flourish. In winter the young trees must be protected from the cold by wrapping the trunks with straw and covering the base of the tree with a mixture of hay and mud, and this process must be continued until the trees have reached the age of 40 to 50 years.

The season for planting the lichee tree is in the spring. The seed or kernel from the fruit is placed in the ground and protected with manure and mud. When the tree is one year old it is transplanted to a location near a stream if possible. At the age of five years the tree comes into bearing, but the fruit is of a poor quality and gradually improves as the tree matures. Fruit of a good quality as a rule can not be expected until the tree is 30 to 40 years of age. The life

TAFT AVOCADO

Grow Avocados

(Alligator Pears)

Greater profits are being returned to the growers of Avocados than to most any other class of horticulturists. Intense interest has been created in growing this wonderful fruit, and all planters having favorable locations for its culture should not hesitate to plant their trees now.

The Avocado will thrive in all locations where citrus fruits can be successfully grown and the hardier varieties will endure without serious injury, ten to fourteen degrees of frost.

Twenty-one Proven Varieties to Select From

varieties that have "stood the test"—trees that are scientifically propagated, the buds being procured under personal observation from the best fruiting trees in California. It's good advice to make "sure" of the origin of your trees, if you want best results.

Don't Pay "Fancy Prices" For Your Avocado Trees

but write for my catalog and price list, illustrating and describing the many varieties. Can supply choice trees at from \$1.50 each and up—according to size, variety and quantity wanted. Special prices on large lots.

Armstrong Nursery ESTABLISHED

ASCOLANO OLIVES

PLANT MORE

Olive Trees

Should you for any reason be hesitating in the matter of planting Olive Trees "forget it." The growing of Ripe Olives is bound to become the state's most profitable industry. The growers will soon be cooperating in marketing their fruit, and from the day the organization is completed you'll see Olive groves demanding greatly increased prices, and the owners will be refusing tempting offers; therefore, plant your land—such as may be adapted to Olive culture—and plant now—but make sure of getting the best trees; trees that have absolute certainty of quality; trees that will bear an abundance of fruit and bear early. My trees may not be the lowest priced but I do claim they are the cheapest in the end. All are propagated from the best fruiting trees in California.

NINETY-NINE PER CENT OF ALL MY TREES
SENT OUT AND PLANTED THE PAST SEASON ARE
GROWING AND DELIGHTING THE PLANTERS.

Write me for prices on the Manzanillo, Mission, Ascolano and Sevilliano varieties, stating number and size of trees—and variety wanted, and I will quote you lowest prices on trees of highest quality. Ask for by 1916 illustrated catalog, of Olive and other Fruit Trees—just off the press.

of the lichee tree is several hundred years. Grafting may be employed to good purpose if it is desired to hasten production, and for this purpose the Chinese select the "kwai" tree (Cinnamomum cassia) and the "wai" tree (Sophora japonica). Good fruit is usually obtained from trees that have been grafted after the lapse of three to five years.

Harvest Period.

In April or May the lichee tree is in blossom, and if during these months it is visited by strong winds and heavy rains in all probability it will not bear fruit. Generally speaking the lichee harvest occurs in June and July, one species after another coming to maturity. The poorest fruit marks the beginning and end of the season, the best coming in during the middle of the season.

It is said by the Chinese, and it is a very interesting fact to note, that prior to the plucking of the tree it is immune from the ravages of insects and birds. The tree is protected, the Chinese say, by a black-winged insect that spins its web in the tree and emits an unpleasant odor which effectually protects it from destructive insects and birds; but if any of the fruit is plucked the tree is deserted by the black-winged insect and is left a prey to its enemies. Accordingly the farmer who is wise will take the precaution to strip the trees of all of the fruit as quickly as possible.

SPANISH ORANGE CROP BACK- WARD

Valencia

The rains ordinarily expected in September and early October did not materialize in the Valencia orange district; hence the fruit has not developed as well as had been hoped and the proportion of large sizes will probably be lower than was anticipated a month ago. The weather has also been warmer than usual at this time of year. At this writing cool nights are looked for to impart color to oranges, but in this respect also hopes have been disappointed. On the whole the crop is somewhat backward.—Consul Claude I. Dawson, Valencia

Andalusia

The general outlook for the orange crop in Spain, especially in the region covered by the Seville consular district, has changed considerably since previous reports from that office.

The region covered by that district comprises the provinces of Seville, Cordoba, Cadiz, Badajoz, Huelva and Caceres, all of which provinces produce oranges to a certain extent, though Seville is practically the only province which exports in large quantities. The oranges produced here are usually of the sour variety, the exports going generally to England for the production of marmalade, the Seville sour oranges being especially suitable for preserving.

At the beginning of September growers reported that conditions were normal, the trees had been benefited by the heavy rains of the preceding winter and a medium crop was expected, as the trees had flowered satisfactorily. The fruit, however, does not seem to have grown satisfactorily, owing to excessive heat during the summer months and the lack of the usual autumn rains, and experts now state that it is evident that the crop this season will not nearly equal that of last year in quantity, as there is a partial failure in some districts and generally the trees are not so well loaded with fruit as last year.

The demand from the United Kingdom is large and growers are asking 2 reals (at present rate of exchange, 9.4 cents United States currency) more per hundred oranges than in June and July, 1915, which represents an additional cost of about 2.25 pesetas (42.3 cents) per half chest.

Oranges in Seville are packed in cases containing approximately 480. The crop is picked during the latter part of November and December, the first shipments being usually made the first week in the latter month.

The present year's crop will be sound in quality, so it is stated, but will probably not be more than half the quantity of the 1914-15 season. No statistics are available of the actual production.—Consul Wilbur T. Gracey, Seville.

Kinsman Beauty (and Calf) No. 139476
Owned by Dr. Roberts
Year's Record:
580.82 lbs. Butter
12,724.50 lbs. Milk

It's Up to You When Your Cows Get "Off Feed"

It's mighty important that you do something for your cows when they are in this condition. But it's just as important to care for them when they are giving a good flow of milk. A cow should be fed to her full capacity if she is to be profitable. The strain of milk production is apt to overtax the digestive organs. The heavy milker needs a tonic to act on the secreting glands that produce the gastric juices that convert the food into milk. Dr. David Roberts' COW TONIC does that very thing. It contains such roots, barks, herbs, as nature would supply if the cow roamed the meadows and woods.

Dr. David Roberts' COW TONIC

is a great conditioner at all times, especially when cows are stabled or on dry feed. Cow Tonic is not a food, but a genuine tonic to act upon the digestive organs and enable cows to get full benefit of their food.

Breeding Tonic acts on organs of reproduction and gets animals in condition for sure breeding.

Cow Cleaner removes the afterbirth naturally. Heals and leaves breeding organs in normal condition.

Calf Cholera Remedy prevents scours and calf cholera. Keeps calves in continuous growth.

Calf Meal, Diolice, Badger Balm, Laxotonic and Stokvigor—valuable remedies, which should always be kept on hand.

Special Sample Offer STOKVIGOR, 10c

Enough to feed a cow two weeks. Aids digestion, tones the system, makes animals grow fast and develop better. Send 10c and we will send Special Sample Package to test on your own stock. Don't fail—don't wait. Enclose dime or stamps.

Get Dr. Roberts' Live Stock Prescriptions at your drug store—nearly 4000 dealers in U. S. If you do not already have the 184-page "Practical Home Veterinarian," treating all diseases of all live stock, send 25c and receive by mail, postpaid. Address

Live Stock and Dairy

WINTER SHELTER FOR THE HOGS

Written for the California Cultivator
By W. S. Guilford

RIGHT now is the time to be doing something about winter shelter for the hogs, if this has not already been attended to.

Many people think that because our winters are very mild, particularly in Southern California and in the San Joaquin and Sacramento Valleys, that the hogs can rustle for themselves the same as the hoboes do. And it is true that hogs will live through all right and not perish with cold and exposure, as they might in the Eastern states, but they will pay handsomely for a little attention in the way of providing a dry place to sleep in and some arrangements for keeping them out of the mud during the worst of the rainy weather.

This shelter need not be expensive. A roof over the sleeping quarters that will shed rain and closed up at the sides enough to prevent drafts is enough, and some kind of a feeding floor to keep the hogs out of the mud and prevent the waste of grain will do very well.

Plenty of Kreso dip and crude oil should be used around these quarters to keep them free from lice, and the hog should be dipped or sprayed for the same reason.

Whenever it is possible these hog quarters should be located on some high, well drained place, and where no such situation is available it will pay to grade up a mound. The drainage away from the hog lot should be carefully looked after and kept open during the winter.

On some farms the hogs cease to be revenue producers at the beginning of the rainy season, and many not only do not make gains during the winter months but are actually lighter and of less value in the spring. There is no economy in such a situation, and a little planning and small expenditure now will change loss into profit.

MAKING COTTAGE CHEESE

When one does not find ready sale for all of the buttermilk and skim milk, a profitable method is to convert it into some form of soft cheese.

Cottage cheese, which is frequently called "schmiercase" and Dutch cheese, is the most popular and more extensively used than any other variety, and the demand for it is good in towns and cities. The process of making consists in separating the curd from the whey. When the whey is saved it makes a desirable material for mixing with shorts or corn meal as slop for pigs.

The first step is getting the milk properly coagulated. This can be done either by permitting the ordinary lactic germs to complete the work, or it can be helped to great advantage by the use of rennet tablets or liquid rennet in proper quantity. The skim milk should be brought to a temperature of 72 to 75 degrees and held there during coagulation.

Unless it is already partly sour it is best to add a starter of buttermilk in order to hasten clabbering, and in two hours add the rennet solution, if

it is used at all. It will require from five to eight hours for the curd to harden enough to begin separating from the whey. At this stage draw off the whey with a strainer, or scoop out the curd and place it in cotton bags for draining. The escape of the whey may be helped by pressing the bags or by using a small cheese press, jelly press or cider press.

When all the whey has drained out the curd should be well worked with the hands and salt added at the rate of one ounce to every five pounds of curd, also a little pepper to taste if desired. Some customers desire a little sweet or sour cream or soft butter mixed with the curd, and they will pay more for it in this way.

The cheese may be prepared for market in round balls or rolls or in square prints and cakes of convenient sizes, and should always be wrapped in oiled or parchment paper. Sometimes it is delivered in the small pasteboard cartons used for butter, or in a pail similar to oyster and ice cream packages. Prices range from 15 to 25 cents per pound, according to the mixture used, size of package and local demand. From 18 to 20 pounds of cheese can be obtained from 100 pounds of milk.

In the making of this by-product practice makes perfect, and there is little loss if a few batches are spoiled in trying the work. Any dairyman who is selling milk or butter regularly to private customers could carry the packages of cheese on the wagon with little extra trouble, and could get orders in advance for it, thus being enabled to make the right amount each day. There is more money to be made in making and selling cottage cheese than many people suppose.—Farmers Guide.

DRAFT HORSES NOT DOOMED

Some people seem to delight in prophesying how the motor truck and tractor are eventually going to drive the horse out of business. Here is what one city editor said recently on this subject:

"The heavy draft horse is doomed. He will not vanish suddenly, but his hour has struck. Motor trucks already are displacing him in cities. The cheap farm tractor will do the same in the country. In a few decades the great, magnificent brute will be little more than a memory. Their places will be taken by bloodless machines that never whinny greeting to a kind master, never search one's pockets for sugar—and never break their legs on icy pavements or drag out a friendless old age under the whips of stupid, greedy drivers."

This is the same old story that we have heard for the last dozen years or more, ever since the automobile first made its appearance. But there are more horses in the country now than ever and the price for good animals was never so high. In its advent the auto so far has failed to replace the horse to any appreciable extent. Fool prophecies that it would ruin the horse industry have not come true. Neither do present conditions seem to indicate that such will ever be the case. So with the tractor. The trac-

tor will relieve the horse of much of the heavy work on the farm, but as to displacing him entirely or even to a great extent—there is absolutely nothing in it. Good horses are needed on the farm more than ever, the coming of the tractor notwithstanding. Horses are not going to be supplanted by motor machines, and anyone who thinks they are had better revise his method of reasoning. Stop trying to shove the faithful horse out of his rightful and permanent place on the farm! It cannot be done by all the city editors in the country.—Farmers Review.

GROUND VS. WHOLE GRAIN FOR LIVE STOCK

It is somewhat doubtful whether the grinding of corn for some classes of live stock is worth the labor and expense involved. Tests conducted for ten years at the Wisconsin experiment station showed an average increase in gains of about six per cent from grinding corn for hogs. The results for individual years ranged from 11 per cent loss to 18 per cent gain. The Iowa station has also done considerable work in testing various methods of preparing corn for hogs and found that while grinding showed a slight increase in the feeding value of corn for older hogs, such gains did not begin to pay the cost of shelling and grinding. Soaked shelled corn showed to much better advantage than the corn meal and also proved somewhat better than the dry ear corn.

It was a question however whether the difference in feeding value paid for the labor of shelling and soaking.

It is advisable to grind small, hard grains as kafir, milo, barley, rye or sorghum seed, as otherwise a large proportion of the feed may not be digested.

Ground oats for horses have not shown any great advantage over whole oats except in the case of horses that are at very hard work or have defective teeth. Grinding oats for hogs, however, will increase their feeding value from 20 per cent to 30 per cent, since the hog is not able to digest the whole grain to advantage.

As much as 25 per cent of whole corn may remain undigested when fed to cattle. Unless hogs follow the cattle in the feed lot it is desirable to grind the corn to prevent waste. Sheep will handle whole grain to much better advantage.—Chas. I. Bray, Colorado Agricultural College.

THE WOOLGROWER AND THE WOOL TRADE

The United States ranks as one of the principal wool producing countries of the world. The amount of wool imported by American manufacturers is equal to more than one-half of the home grown clip. American and foreign wools are often offered for sale at the same time in the warehouses of Boston and other wool marketing centers. Some American wools are equally as valuable as the best

foreign wools of the same class. On the whole, however, the appearance of American wools compares quite unfavorably with that of most of the foreign wools. The difference is due nearly altogether to the growers' methods of preparing the wool for shipment. Foreign wool growers, the Australians in particular, maintain a uniformly high standard in the handling of their wools. This care in preparation and the certainty as to the character of the contents of the bales have given their wools a high reputation that insures their bringing full value at the time of selling to the manufacturer.

Persons familiar with the buying and manufacturing of home grown and foreign wools assert that on account of poor preparation American wools net the grower from one to three cents a pound less than their actual value. This is due to the failure to classify the wool before selling and to defects from the use of improper twine, branding paints, and other minor causes.

Most American grown wool is sacked just as the fleeces come from the sheep and sold at home to dealers. Before offering wool to the manufacturer the dealer makes up from his various purchases a number of piles, each containing only fleeces of similar character and value. This work constitutes grading and should not be confused with the sorting done at the mill.

A couple of years ago the animal husbandry division of the bureau of animal industry, department of agriculture, made a canvass of a number of sheep owners in the Western states to determine the extent to which growers follow the best practices. Because of the way in which the names were secured it is probable that 383 replies received were from men whose methods are superior to those generally followed in the same localities. Practically half the correspondents "separated ewes", lambs', and bucks' wool when sacking; 59 per cent put up the black wool separately; and 53 per cent sacked the tags separately. The American wool clip is sold by the growers unclassified and in the main very poorly handled. These defects have come to constitute a fixed charge against American wool, which does not apply to wools coming to this country from Australia and some other countries.

SCENT FOR BAIT

It has been found that the use of fetid scents is very valuable in attracting coyotes to poisonous bait or to traps. Below we give the directions for making this fetid bait as recommended by the United States biological survey and many old hunters:

"Place a half pound of raw beef in a wide-mouthed bottle and let it stand in a warm place, but not in the sun, for two to six weeks, or until it is thoroughly decayed and the odor has become as offensive as possible. When decomposition has reached the proper stage add a quart of sperm oil or any liquid animal oil. Lard oil may be used, but prairie dog oil is better. Then add one ounce of pulverized asafetida and one ounce of tincture of Siberian musk or Tonquin musk. If this cannot be secured use in its place one ounce of dry, pulverized castoreum (beaver castor) or one ounce of the common musk sold as perfumery. Mix well and bottle securely until used.

"After setting the traps apply the scent with stick or straw or by pouring from the bottle to the grass, weeds or ground on the side of the trap opposite that from which the wolf would naturally approach. Never put the scent on the trap, as the first impulse of the wolf after sniffing the scent is to roll on it."—National Wool Grower.

The Alpha Automatic Power Spray Outfit (Patented)

Fitted with 2 in. or 2½ in. Automatic Duplex or Triplex Pump
Equipped with the New Mechanical

Automatic Pressure Governor

The Automatic Pressure Governor Insures Safety, Secures Uniform Pressure and Eliminates Unnecessary Wear. No Relief or Diaphragm Valve Required. Top Guard Rails Fold Up or Can Be Quickly Removed. Gear or Belt Driven. Brass Fitted Throughout.

THE TWO ESSENTIALS in a power sprayer are a thoroughly dependable engine of ample horsepower and a positive and reliable pressure regulator that will insure uniform pressure and eliminate unnecessary wear.

THE AVERAGE SPRAY is equipped with a cheap engine and a make-shift pressure relief valve or diaphragm which is exposed to the corrosive action of the spray material which soon puts it out of commission.

THE ALPHA AUTOMATIC PRESSURE GOVERNOR with which the Alpha Spray Outfit is equipped is a simple arrangement of a combined lever and spring on each plunger connecting rod which, when the pressure reaches a predetermined limit, automatically discontinues the operation of the pump without interrupting the driving power, again permitting it to resume operation when the pressure falls below the point at which it has been set.

THIS INSURES SAFETY, secures uniform pressure, and eliminates unnecessary wear (no liquid pumped except it passes through the nozzles), the pressure relief is not dependent on the operation of a sluggish or defective relief valve, but is positive and mechanical, thus making it impossible to run the pressure up to the danger point.

THE POWER PLANT depending on the size rig is either a 2½ H. P. or a 3½ H. P. Alpha Engine equipped with a "built-in", gear-driven, positively timed magneto, requiring no batteries or coil, and is easily started on the magneto without cranking.

CAN YOU AFFORD to own a spray outfit that will balk? When you get ready to spray you have no time to tinker with a defective engine, pump or relief valve, but want an outfit that is capable of a continued high pressure maintenance and one that is thoroughly dependable in every particular.

THE ALPHA AUTOMATIC SPRAY OUTFIT will meet your most exacting demands. The entire frame work is made of channel and angle iron, fitted with a wrought steel bed plate on which the engine and pump are mounted, direct connected with machine-cut steel gears.

BUILT IN ALL SIZES from a 2-inch pump and a 100-gallon tank to a 2½ by 3-inch pump and a 200-gallon tank. (Either duplex or triplex.)

IT WILL PAY YOU to investigate thoroughly the merits of the Alpha Combination Power Sprayer before buying. Send for catalog and prices.

"I Thought She Would Never Amount to Anything"

Many cow owners all over the country know what it is to see a cow that they were about ready to sell to the butcher become one of their best producers through a judicious use of the great cow medicine

There is nothing mysterious about Kow-Kure; it is simply a medicine for cows that stimulates and builds up the vital organs and makes them perform properly. It has been found especially effective for the prevention and cure of such diseases as Abortion, Barmess, Milk Fever, Scouring, Lost Appetite, Bunches, Retained Afterbirth.

A GREAT RECORD FOR THE DUROCS

Written for the California Cultivator
By W. S. Guilford

A year and a half ago there were no registered Duroc-Jersey hogs in Napa County. Now there are 20 herds, and a Napa County Duroc-Jersey Swine Breeders' Association is being discussed. Beside doing all of the other things possible to promote the interests of the breed and the swine business in general it is proposed to hold a public sale of Durocs.

This proposition cannot be commended too highly. Community and county breeding organizations have been the instruments for the doing of great good throughout the East and as much or more can be accomplished by them here. There are many districts in California where owners of small farms can materially add to their incomes and insure their future more surely by the breeding of registered swine than in any other way.

E. F. Curtis of Napa is the leading spirit in this Napa County Duroc-Jersey breeder's movement, and he is fully supported by the farm adviser and many others.

WOOL GROWERS

By reason of the authority invested in me as president of the National Wool Growers' Association, I hereby issue a call for that association to meet in its 53rd annual convention at Salt Lake City, Utah, January 13, 14 and 15, 1916.

At this convention there will be a full discussion of the following subjects: Sheep Breeding and Wool Growing; Sheep Feeding; Preparation and Marketing of Wool; the Remaining Public Lands; Grazing in National Forests; Destruction of Carnivorous Wild Animals; Railroad Rates and Service; Live Stock Finance; Needed Legislation, Both National and State; as well as other subjects of interest to sheepmen.

On behalf of the American sheep industry, I desire to extend a most cordial invitation to all those interested in any phase of the sheep industry to meet with us at our 53rd annual convention.—Frank J. Hagenbarth, President, National Wool Growers' Association.

HORSES SENT TO EUROPE

Produce better horses.

About half a million horses and mules have been sent to Europe because of the war, according to Professor E. A. Trowbridge of the University of Missouri. Although the number sounds large, it really includes less than two per cent of the 28,000,000 horses and mules on hand in the United States January 1, 1915, and a still lower percentage when we remember the 1915 colts must be added to this number.

The 400,000 horses bought for export for use in the war are among the lighter animals ranging from 1000 to 1500 pounds in weight. Although many of them are of mixed breeding, they are good, useful horses but do not sell for particularly high prices, and there is an opportunity for the raiser to produce others of much better type to replace those that have been sold. The increased cost of land, labor, and other things used in horse raising has gradually widened the gap between the price of good horses and mules and those of inferior animals until now only the superior animals can be produced profitably.

About 80 per cent of the horses and mules in the country are now owned and used on farms. The automobile, auto truck, and farm tractor all help to replace some of these animals, but any great changes in this direction will come about gradually and production will be governed largely by demand. In view of these constantly changing conditions, however, the business of horse production offers unusual opportunities to the man who succeeds in meeting market demands successfully. Horses of the draft or high class saddle type or mules of good size and quality and capable of doing lots of hard work are likely to prove most profitable.

THE SILO MAN SAYS

To figure the proper size of your silo, allow three tons of ensilage to all cattle over one year. This is sufficient overcapacity to take care of the calves and allow for some stock increase.

A silo will pay if one has 12 or more head of cattle. It will increase the amount of stock the farm can carry.

Location is important. Filling is at most a two or three days' job. Feeding may last half the year. Put the silo conveniently near the mangers.

An expensive barn in connection with a silo is not necessary, but a warm and well ventilated barn is essential.

Whatever the preferred make of silo, see that it is well set on its foundation, properly banded or reinforced, and if of wood, amply anchored against winds.

"The deeper the silo the better the ensilage" is a rule to remember while building. Farmers in the older sections are building as high as sixty feet. Increase of height renders doubly necessary the caution about foundations.

It will pay to use a creosote paint on the inside of a wooden silo and to wash with clear cement the inside of a concrete or brick silo.

The so-called "pit silo" can only be built where the ground is always dry to beyond the extreme depth of the silo—in other words it will not work where you can strike water while digging.

Carbonic acid gas is formed by new ensilage. In the pit silo or in others with airtight walls above the ensilage this gas collects and may kill the man who enters. Lower a lantern; if it goes out or burns dimly it is unsafe to enter.

Packing properly is the great thing in ensilage making. Tramp the edges. Imagine you are making a jar of sauerkraut.

The closer corn is to being ready for the shock the better it is for ensilage. Don't waste time snapping the ears. Feed the whole-corn ensilage, and let the hogs gather the waste by running behind the cattle.

Ensilage is not a balanced feed. It needs clover or alfalfa hay and ground feed in addition.

For a cow giving 30 pounds of milk per day ten or 12 pounds of alfalfa hay, eight to 12 pounds of concentrates (bran, shorts, ground feed, mixed) and 30 to 40 pounds of ensilage forms a good ration.

Ensilage fed in excess, to the exclusion of other feeds, especially if made out of unripe corn, does not give good results. The ensilage is not to blame. Blame the feeder.

Cowpeas, oats, sorghum or other crops of like general nature make good ensilage, bearing the same general feeding value to corn ensilage that the crop so used bears to the corn crop.

The silo creates pasture conditions throughout the year. Rightly managed, it will pay for itself in two seasons.

Purebred Registered
HOLSTEIN CATTLE

Farmers looking for the largest profit in dual purpose cattle should not overlook the fact that the Holstein-Friesian breed represents the ideal beef and milk form. The registered purebred Holstein has a higher percentage of weight in the hind quarters than any other breed. Holstein beef is of high quality. Holstein steers inherit from their dams a capacity for assimilating large quantities of feed, make fast weight gains, and are most economical producers of beef. Investigate the big "Black-and-Whites."

Poultry for Profit

THE BEST POULTRY HOUSE

Written for California Cultivator

By Jean A. Koethen

BUILDING poultry houses in California is like fixing over a lady's gown. You use the materials you have, only taking care to see that the finished product is large enough. If accessories and material do not match, never mind; pretend they were not intended to match.

Many of the problems of the Eastern poultry keeper are unknown to us. We have neither snow nor blizzards nor frozen combs to worry over. Hence the directions for building given by Eastern experts pass us by as lightly as a summer breeze. That we have problems of our own has not occurred to some of us. One of these problems is the rather rapid deterioration of poultry in warm climates. They miss the bracing effect of real winter, just as we do, and must have their idiosyncracies more carefully considered in some ways than those husky fowls that are buried under snow half the year (or less) at the Maine station. I doubt if roup is any more prevalent in Maine than in California, and chickenpox certainly is not. The farther south you go, so authorities say, the worse nuisance this troublesome disease becomes.

But what has all this to do with housing? Just this, that the poultry house must be planned to remedy as far as possible the faults of climate. Where fowls can comfortably (and with great advantage) roost out of doors almost the year round, indoor conditions must conform to the ideal outdoor conditions. These are, plenty of room, unlimited fresh air and freedom from insect pests.

Now unlimited fresh air means cleanliness, for there is no fresh air where droppings are allowed to accumulate week after week. Freedom from insect pests also means cleanliness, absolute cleanliness. I think we must put first, as one of the requisites of a California poultry house, perfect ventilation. Second we may put a simple construction which admits of easy and thorough cleaning. Third we will put protection, for our winter rains are penetrating, and no hen likes to go about with damp, dragged feathers or to be obliged to scratch in the mud or not scratch at all. Fourth we will put adequate size, for there can be neither fresh air nor cleanliness where birds are crowded together in quarters too small for them.

Types of Houses

There seem to be three types of poultry houses in general use in this state: The simple, open front shed without any provision for scratching room; the open front roosting house with scratching shed under the same roof, and the double decker, a modified Eastern type, in which the building is high enough to admit of scratching room under the floor. I saw several houses of this last type in a poultry colony near the coast where fogs and chill winds prevail, and it seems well adapted for such a location, though a bit expensive for most

places. The floor of the laying house was perhaps five feet from the ground and reached by a stairway at one end of the building. Twenty-four roosting apartments, each designed to hold 50 hens, were connected by an open alley at the front so that each hen had the length of the building for her playground, though she was expected to go home to roost. Dropping boards kept the night droppings out of the deep litter which covered the entire floor, and nests were underneath the dropping boards. The entire front of the building was open and looked toward the south, but curtains were provided for rainy weather. A small stairway in front of each apartment led down to the ground below, and we were told that the hens quickly learned to go up and down these.

I never saw more comfortable looking hens than the Leghorns in this cozy laying house, and could easily believe the statement of the caretaker that his hens laid in winter when nobody else's did.

The roosting-house-scratching-shed type, in which all is under one roof, with the ground for a floor, is seen in California with many modifications, and is probably the best house for our climate. One prominent Leghorn breeder uses for her layers a house capable of accommodating 50 hens, open front, of course, and with some sort of window at the rear to give a draft in summer. A small door, just big enough for a hen, connects this roosting house with the scratching shed, on one side of which are the nests. Another uses a similar roosting house, but smaller and with cement floor, while the connecting scratching shed has dirt floor. These two houses have the alley along the front. Another carefully planned house has the alley in the middle with a row of roosting rooms on each side and feed troughs along the alley where they can be easily reached. Another has the open front laying house, with space for scratching under the roosts. This necessitates a board floor, and is therefore more expensive.

Many commercial egg ranchers seem to manage very well with the colony house holding from 30 to 50 hens. Some of these houses may have scratching space under the roosts but many I am sure do not. In rainy weather the hens are forced to crowd upon the roosts, or perhaps under them, and manage as best they can till the storm has passed. These houses are no cheaper than the long laying house, but they give opportunity for distributing the birds over more ground, which is in some ways a great advantage.

The Cheapest House

The cheapest house is a square house; the cheapest roof a shed roof; the cheapest floor a dirt floor. How much is to be gained in our climate by a cement floor I do not know. They are more easily cleaned, no doubt, but so few are seen that one is forced to conclude most poultrymen do not consider them worth while. The character of the soil determines to a large extent the floor required. In our locality the decomposed granite soil packs in many places till it is nearly as hard

as cement. No need of cement floors with such soil, nor of dropping boards, unless they are needed for giving more room underneath. The same is true generally of adobe. It is even more floor like than granite. I should like to try treating such a floor with road oil as is now and then recommended.

In planning a house the number of hens it is to contain must be carefully considered. Four square feet of floor space for each hen of the heavy breeds, or three to three and a half for Leghorns, is necessary to secure abundant roosting room and air space. A house 14 feet square, which is a very good size for a farm flock, will therefore accommodate 50 heavy hens or 65 Leghorns. A house eight by ten, which is a very good size for a colony house, holds 25 heavy hens, a large enough flock for the backyard poultry keeper. Either of these houses, built with shed roof, fronting south, with all or nearly all the front to the sun, and with dropping boards, so that the entire floor may be covered with straw for rainy weather scratching, makes a very satisfactory building for the small flock. A building of this sort should be so high that the attendant can enter it without stooping, say seven feet in front and five and one-half feet at the rear, and should have a window or windows sufficient to insure absolutely fresh air in summer. A building open on two sides is excellent for summer, and this can easily be managed when several laying houses are built together with scratching shed between. When a single building is used, like the 14-foot building mentioned above, it would be a good plan to make one side all windows or open and so arranged that curtains can be drawn in winter.

South Front Best

The best front for a poultry house is south, but something depends upon the location. Prevailing winds must always be considered. In general the winds from which our hens must be protected come from the north or northwest, and a south or east front is always a necessity. On the other hand our winter rains come from south and east and there must be some protection from them. A portable house, which can be turned with its back to the wind, in whatever direction that may be, is very convenient but affords no scratching shed accommodations. As a rule if the roosts are placed at the rear of the house and some provision made for curtains which can be closed during rains, there will be little trouble. A door hinged at the top so that it makes a protection from the sun when it is raised and from the rain when it is lowered, is as good as anything for this purpose. When this cannot be had the inevitable burlap sack makes a fair substitute.

A recent Cornell bulletin argues that if 50 hens is a good number for

**Lasher's
Hatchery**

one house, 100 is better, since labor and housing will both cost less. On the other hand the number of hens in one house should not be above 500 or disease will find too easy entrance. Few California poultrymen keep more than 50 hens in one roosting house though many use the long laying house. It is a question whether it would be wise in our climate to keep a larger number than this, but that is one of the things we have to find out.

The Colony House

When only a small number of birds are to be kept in a house, as is the case on most breeding plants, the small colony house is generally used. On one of the most up-to-date plants in Southern California the male birds are kept in colony coops capable of holding from four to twenty birds apiece. These coops are of light lumber covered with tarred paper, with the penthouse door for shade. These coops can be readily tipped over and every inch painted with disinfectants. The breeding pens are housed in larger colony houses, probably six or eight feet square, with the space under the roosts carefully fenced in from the rest of the floor so that there is abundant scratching space.

The portable colony houses, small and light enough to be carried from place to place, are a great convenience, and when made of tarred paper cost but little. Tarred paper is not very durable and must have a substantial foundation of wood to keep it firm, but it makes a light house and is itself insect proof. Between it and the boards to which it is nailed, however, is the choicest harbor possible for mites and one harder to reach with insecticides than the cracks in wooden buildings. In some districts where ticks and fleas

are troublesome these colony houses are made of galvanized iron which is absolutely insect proof.

HENS FOR EGGS

Written for California Cultivator
By J. R. Henderson, Phoenix

The other day, September 25, I was told that a man near me was getting three cases of eggs a week from 400 birds. Such an output being somewhat unusual in this (Salt River) valley at this time of the year, I went to see him. I found that the report was quite true and that the hens were not only in fine shape but were giving an excellent account of themselves as well. Their owner himself is a long, long way from chicken age and has had plenty of chances of seeing men try all sorts of ways of making and losing a living, and he has a firm belief in poultry for putting money in his purse. He told me that he found his hens gave a better return for outlay, and at less risk, than cows or hogs. He showed me that he got two dollars out of his birds with which to pay each dollar he had to put into them, and that the net profit on his 400 head at the present time was a quiet \$15 a week.

Of course some people will smile at the idea of a paltry sum like this and will talk (in advertisements) of the wonderful results which you will get (on paper) if only you will buy their stock or their eggs or their food or whatever else it may be. Maybe you will, if only you don't get tired of trying, and have any money left to go on trying with, but I know a few quite honest men and hard workers, and not fools either, who would be very glad to be doing as well as the subject of this true story.

Now as to the birds that were earning their keep and a little over to pay taxes with, I found them to be a very comfortable looking lot of crossbred ladies, of an average weight of five and one-half to six pounds. The foundation stock was Brown Leghorn, and the crosses used had apparently been Barred Rock and White Wyandotte. Most of the flock was confined in a run of about 250 feet by 50 feet. The rest seemed to be at liberty. The birds looked good to me, that is to say, that though they were crossbreds they were clearly bred from really good stock on both sides. There was nothing of the scrub about them anywhere, and no one who knew anything about stock would call them mongrels either. They were a set of fine, business-like hens, who had no reason to be ashamed of themselves or their parents. They looked as if they knew perfectly well that they were in the world simply for the egg and meat proposition and didn't mean to be beat by any hens living.

As for their housing, it was practically a water tight roof and nothing more, good enough for the birds, but very scant accommodation for a louse looking for a night's lodging for his family. The feeding was decidedly interesting. The owner of these fortunate hens had found a means of getting a steady supply of—what do you think?—old cheeses that were no longer fit for market. I must confess to being fond of an old, ripe cheese myself and I could not see anything wrong with the sample one produced for my inspection. However they were to be bought for a cent a pound and that did not seem much. The second item in the morning feed list was buttermilk, which was put into a big pan and boiled. Into the boiling milk was put a good lump of cheese, which soon

melted. Rolled barley and bran formed the body of the feed and all that I can say is that a piece of the cake thus made smelt so good that it is no wonder the hens thrive on it. What the other meals consisted of I don't remember, and I hardly think it much matters what they were; it was the morning dish that made those hens without rivals in the laying line.

And yet, was it that alone, would you say? I am not sure that I would like to say that either. You see they were a lot of really fine crossbred birds, that is to say they were bred from good specimens of different varieties, in each case possessing fine laying qualities. Surely the combined effect of the good qualities shared in common by two vigorous specimens of distinct varieties should give the best of results. And as a matter of fact they do give the best of results, so long as you don't want to sell stock or eggs for setting. But the mating needs to be carefully done, as carefully as if you were mating for prize winners, in a way. Any old stock of different breeds won't do; you want the best you can find, and then you may look to get something from your mating that will please you and put some solid money in your pocket. And if youthful chicken people who have yet to learn how quickly some hens (like some other two-footed creatures) can make dollars fly, turn up their noses at the sight of your yards, it won't hurt you, so long as your bank book has a pleasant tale to tell.

I do not for a moment wish to suggest that some of the pure breeds can not give a most excellent account of themselves. Of course they can and do. The trouble is that their utility qualities suffer so much at the hands of those who exploit them for show purposes, and regard them as of value from the point of view of the fancy only. How many fine utility breeds have been and are being spoiled through the requirements of the show pen? What about that wonderful table fowl and fast grower, the Faverolles? Are feathered, or not feathered legs, five or four toes, or ten-toe questions to be allowed to spoil that breed for the meat market? How long is the Sussex going to be a king of table poultry if a few white tips here and there are to constitute the value of one of the most popular members of the family? I am as keen a show man as any one, but I know that I can not eat my cake and have it. If I wish to insist on getting certain merely fanciful points I know that I am also certain to risk the loss of some practical ones. Why not for the sake of a long suffering public establish and recognize a first class table breed and forbid it to be judged, under severe penalties, except for strictly utility points? A few very highly skilled poultrymen may try their honest best to combine the demands of the club standard with those of the dinner table and perhaps have some small success, but what of the thousands who keep poultry simply to make money by winning prizes and by selling stock and eggs? I do not blame them. All I say is that their system of mating is guided solely by the requirements of the show standard, and the probable end of such mating is the death of their pet breed from the utility point of view.

Give the chickens plenty of fresh water. Sixty per cent of the hen's body and 60 per cent of the egg is water.

CLASSES OF CHICKENS

What breed of chickens to use on the farm, is an ever recurring question. So far as those qualities that are important on the farm are concerned, the principal distinctions are between classes rather than breeds.

The Mediterranean breeds are small, sprightly, very nervous in disposition, are good rustlers, can fly over any fence that is likely to be constructed, are clean legged, and are good layers of pure white eggs of fair size. The Mediterranean class includes Leghorns, Anconas, Andalusians, Spanish and Minorcas. Of these the Leghorns are the most popular among the breeds, and the single comb whites are the most popular of the Leghorns.

In the Asiatic class are found birds of the opposite extreme in almost every characteristic. They are the largest of the chickens, are slow maturing, and are very heavily and loosely feathered over the body and down the legs. They are rather poor layers of dark brown eggs of good size. The breeds that comprise the Asiatic class are the Brahmas, the Cochins, and the Langshans.

About half way between the Mediterranean and Asiatic breeds in most characteristics are the American and the English breeds. They are fair layers of light brown eggs, and while not so difficult to control as the Leghorns, are very much more active than the Asiatics and usually are more desirable for the general farm. Good strains of the American breeds lay nearly as well as the Mediterraneans, and at the same time furnish a better carcass for the home table.

The American breeds which are common on farms are the Plymouth Rocks, the Rhode Island Reds and the Wyandottes. The American breeds which are seldom seen any more are the Buckeyes, the Javas and the Dominiques. The only English breed that has had any large degree of popularity in this country is the Orpington.

The real choice to be made in the way of a breed for the farm, usually lies between one of the American breeds or the Orpingtons on the one hand, and a Mediterranean breed on the other. As a general thing the Leghorns will probably lay more eggs the year round than the American breeds. The question to be decided is whether this fact offsets the difficulty of their control and the fact that their carcasses are not generally considered so desirable.

Within the American class the choice is largely one of personal taste. The fact that the carcasses with light pin feathers are being demanded more and more by the best markets, however, is having more and more influence in favor of the white and buff varieties. On the other hand it is generally understood that where coyotes are still about the white varieties are more conspicuous and more easily picked up.

In the preparation of eggs for market the greatest step in advance that can be made is in educating the farmer as to the importance of keeping the male birds away from the laying flock during the summer months, so that infertile eggs may be produced. —Kansas Agricultural College.

LIVE STOCK

Big Type Poland Chinas—I have an extra good lot of strictly high class young boars from three months to one year old that are fit to head any herd anywhere. Visitors say they are the best they have seen. They have the large size, the good hams and shoulders, the strong arched backs, great length and depth of body, plenty of smoothness, mellowness and quality—in fact, they have two good ends and a good middle, are good lookers and money makers. Their dams are either from Illinois, Iowa or Missouri, or they are from dams whose sire or dam are from these states. These boars are sired by Iowa Wonder who will weigh over 1000 pounds in show condition. He is a son of a WONDER, the greatest Poland China boar living or dead. These young boars carry the stamp of their sire and will sire pigs that will please you. Satisfaction guaranteed in every particular. I am overstocked. I have boars of all ages. I will sell them at extremely low bargain prices. No females for sale at present. The book on "THE HOG SUPREME—THE POLAND CHINA" will be sent to you free for the asking.

Yours for the BIG TYPE—the kind that grow faster and larger and have more pigs. Geo. A. Smith, Corcoran, Cal.

Billiken Herd of O. I. C. Swine—The big white kind. Early maturing, weight carrying; everything immunized against cholera by the simultaneous treatment. Pigs of both sexes from March, April, May and June farrows. Sires Chief Again, Iowa Boy, Missouri Lad and Woodview Earl. Dams are all of the big, smooth type and very prolific. A few bred sows about ready for their second and third litters. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

Milch Goats—Two hornless, choice specimens: "Yusef", No. 861 A. H. G. R., pure Anglo Nubian stud, dam "Talosssa", No. 470 A. M. G. R., heaviest milker of the breed. Also "Emmy Lou", Saanen-Nubian doe, 8 mos. old. Reduced in price to \$100 for the pair. R. M. Cartwright, 1124 Echo Park Ave., Los Angeles.

Rancho Rubius Herd Durocs won first under six months; Junior Champion; Reserve Grand Champion; Champion Sow bred by exhibitor, second sow under two years, and other premiums at P. P. I. E. A few bred gilts and service boars for sale. Place your orders now for weanling pigs. Elmer Lamb, Ceres, Cal.

Del Dayo Farm (Old Haggin Bottom Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding, BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

For Sale, Bull—Name: Fancy Sir Raleigh, No. 127819, 15 months old. Sire: Nancy's Raleigh—H. R., No. 101312; bred at Good Hold Farm, Menter, Ohio. Dam: Brutus' Fancy, No. 233925, forty-pound cow. Price \$75. W. J. Cole, R. 1, Anaheim, Cal.

Blue Ribbon Herd Duroc-Jersey Hogs, service boars and bred gilts a specialty; also boar and two sows, not related. Meet me in S. F., 1915, prices. John P. Dagg, Modesto, California.

Six Young Duroc-Jersey Registered Boars for sale; sired by Col. Climax. He is a grand Eastern importation. Prices reasonable; immediate delivery. E. E. WHITE, R. D. 2, Hanford, Cal.

For Sale or Trade for stock cattle a first class imported Belgian Draft Stallion. For particulars address R. D. Box 73, Lindsay, Cal.

For Sale—Yearling Jersey bull, sire Silver Marcus; dam, Helen of Valley View. M. E. KERR, R. D., Box 145, Modesto, Cal.

For Sale—Thoroughbred Duroc-Jersey Sows and Gilts, at reasonable prices. Healthy, first class stock. F. T. Harris, El Centro, Cal.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Registered Berkshire Weanlings, both sexes, \$10; subject to inspection. Cash on delivery. J. M. Bomberger, Modesto, Cal.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Navato, Cal.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Calif.

Registered Thoroughbred Berkshires of all ages; Cholera Immune; large boned. Ricconi Bros., Mountain View, Cal.

Registered Shires—Blackhawk Stock Ranch. Importers and Breeders. Easton & Ward, Burlingame, Cal.

Cholera-Immune Mulefoot Hogs—Catalogue for stamp. John Dunlap, Williamsport, Ohio.

W. J. Hanna, Reaoks Ranch, Gilroy—Large type Poland Chinas; bred gilts. Service boars.

Duroc-Jersey Boars, ready for service, low price. Sired by 800-pound boar. Ed E. Johnson, Turlock, Cal.

Poland Chinas—Young Stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

POULTRY

Altho Mahajo Brown Leghorns hatched late, managed to win 4th Cockerel (2 entries), 5th Pullet (3 entries), 4th Pen (1 entry), at Panama-Pacific Poultry Show—160 birds from six states competing. Incubator chicks from range flock (pullet bred), \$20.00 per hundred, hatching eggs \$10.00 per hundred, \$2.00 per setting of 15. Cockerels and pullets from \$5.00 each and upward. Hatching eggs from birds mated for exhibition type \$5.00 per setting. Please specify whether cockerel or pullet matings are wanted.

MAHAJO FARM.

P. O. Box 597, Sacramento, Cal.
"We'll play fair."—You can have our catalogue.

Baby Chicks from my thoroughbred flock of S. C. White Leghorns, carefully selected for laying and standard qualities, \$9.00 per 100, \$35 per 1000. Hatch eggs \$5.00 per 100, \$45.00 per 1000. I have 1400 laying hens and sell between 20,000 and 25,000 Baby Chicks every season. All orders receive my personal, most careful attention. Only eggs from my own flock and from hens that are two and three years old used in my incubators. Correspondence solicited. J. R. HEINRICH, Poultry Yards, Arroyo Grande, Cal., San Luis Obispo County.

Buff Orpingtons, Buff Leghorns, Bourbon Red Turkeys, Buff Ducks—At Panama-Pacific won 1st yearling tom, 4th and 5th turkey hens; 1st and 2nd young pair Buff Ducks, formerly called Buff Orpington Ducks.

At Pasadena, on Orpingtons, all firsts, 3rd hen, 3rd pullet, cup for best display with good competition. We have many big boned, range-raised type Orpington Cockerels of the same blood lines, from \$3 up. Good Leghorns, too. The Ferris Ranch, S. Reservoir St., Pomona.

Make Big Money with our White Orpingtons. Best breed for every need. Lay most when prices are highest; make finest eating; return greatest profit. 1000 grand range-raised birds, trapped and bred for heavy laying. Eggs, chicks, stock. Prices reasonable. Catalog free. Whitten Ranch, R. D. 5, Box 648, Los Angeles.

MacFarlane Strain White Leghorn Eggs \$1.50 per 15, \$2.50 per 30, \$5.00 per 100. Chicks Dec., Jan., Feb. 12c each, afterward 10c. Order now, any quantity. Cockerels \$2.50. Big plant, lowest prices, stock better than ever. Catalog free. Correspondence solicited. Newton Poultry Farm, Dept. 3, Los Gatos, Cal.

Extra Special Pigeon Sale—Many from registered stock, costing \$5.00 a pair. Ninety-five pairs, all carefully selected and mated. Large, healthy. Homers, Runts, Maltese, Carneaux, \$1.50 a pair. Exceptional opportunity to get selected stock at common stock prices. Mrs. T. S. Hardin, Calistoga, Cal.

Penn's Quality Barred Plymouth Rocks. At the World's Poultry Exhibition, San Francisco, our WESTERN BREED Rocks ranked among the best in the WORLD, both in UTILITY and EXHIBITION points. Catalogue free. GOLDEN RULE POULTRY FARM, St. Helena, Cal.

Baby Chicks—All sturdy youngsters from good stock. Hatched right and arrive safely. R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Write for circular. Orders asked now for delivery any time to suit you. Campbell Poultry Ranch, Campbell, Cal.

Brown Leghorn, White Leghorn day-old chicks that are well-hatched and strong from healthy, vigorous breeders. SAN JOSE HATCHERY, 371 Meridian Road, San Jose, Cal. "Chicks well hatched are half raised."

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., 607 E. Third St., Los Angeles, Cal.

S. C. Rhode Island Reds, Lester Tompkins and Winslow strains eggs for hatching. Day old chicks. Prices on application. Raines Court Poultry Ranch, Zelzah, Calif.

A Few Silver Campine Cockerels bred from heavy laying stock; Hering strain; fine shape, beautifully marked, \$3 and \$5 each. VALLEY POULTRY FARMS, Concord, Cal.

Petaluma Hatchery—Capacity 16,000 chicks a week. Five varieties. Can ship to points reached in three days. We challenge the hen. Send for circular. L. W. Clark, Petaluma, Cal.

Barred Rock Cockerels, \$2.50 each. Am now booking orders for Rhode Island Red and Barred Rock Chicks for Feb. delivery, 15c each. G. L. Hawley, Madera, Cal.

Thoroughbred Barred Plymouth Rocks, Voddan strain of heavy layers, 14 cockerels, 12 pullets, \$1.50 and up. Will sell singly or flock. J. C. Sheppard, Jr., 337 Chapman Ave., Fullerton, Cal.

S. C. White Leghorns—Hoganized; bred to lay. Booking orders now for hatching eggs. \$6 per 100; \$50 per 1000. R. H. Dickinson, Pine Tree Poultry Farm, R. F. D., Los Gatos, Cal.

White Plumage Poultry Farm and Hatchery sells White Leghorn baby chicks, full of vigor and healthy, from our own stock. Circular tells it all. Exeter, Cal.

S. C. W. Leghorn Cockerels, pairs and trios; also booking orders for DAY OLD CHICKS; all from the highest utility fowl. Jos. E. Blackshaw, San Jacinto, Cal.

First Class Chix—White, Brown Leghorns, R. I. Reds, B. P. Rocks, Buff Orpingtons for September and later. Stock guaranteed. Hawkeye Hatchery, Turlock, Cal.

Day-old Chicks—Barred Rocks, R. I. Reds, Lt. Brahmas, Buff and White Orpingtons, also breeding cockerels. Enoch Crews, Santa Cruz, Cal.

Wanted—One dozen White Leghorn cockerels; must be strong, well bred birds. Address C. A. Stammer, Box 517, Escondido, Cal.

TREES

Walnut Trees—Late blight resisting varieties grafted and budded on California Black and on FIRST GENERATION Royal and Paradox Hybrid roots, which are as much superior to the California black root, as the California Black root is to the English root—Eureka, Franquette, Mayette, Neff's Prolific, Concord and Placencia. Dr. W. W. Fitzgerald, Elks' Building, Stockton, Cal.

Tribble Nurseries, Elk Grove, Cal.—Grafted walnuts and grafted paper-shell pecans. Exclusive propagators of Tribble Mayette, Kerr Parisienne, Glad and Improved Franquette, 19 other walnut varieties. Fine stock of almonds, prunes, Bartlett pear on resistant roots and other fruit trees and plants. New list ready.

Chase Walnut Trees, grafted on black walnut root. First-class stock. They will make you money. Write for circular and price. Also seedling trees grown from the original CHASE tree. Magnolia Nursery, Whittier, Cal.

For Acacias, Avocados, Budded Loquats. Citrus trees, Evergreens, Feijoas, Palms, roses and all kinds of trees, shrubs, vines, etc. Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

Apricots, Sugar Prunes and Olives—All first class stock. Royal, Blenheim and Tilton Apricots, Mission, Manzanillo and Ascolano Olives. Correspondence invited. Phone C. E. Moyer, Hemet, Cal.

Walnut Trees—Eureka and El Monte varieties a specialty; also Franquette and Placencia. Write for prices and description of stock. Personal inspection invited. Eureka Walnut Nursery, Montebello, Cal.

Fig Trees. 25,000 two-year-old trees from 2 to 6 ft. high. Seventeen varieties. Write for price list. C. C. Terbush, R. F. D. 2, San Gabriel, Cal.

For Sale—Fancy apricot trees raised in Hemet Valley. Wholesale prices. Write L. Kendall, 151 S. Meredith Ave., Pasadena, Cal.

Peach, Plum and Apricots, fine, thrifty trees; none better; low prices. Write Dr. F. M. Jenkins, 1498 Arrowhead Ave., San Bernardino, Cal.

For Sale—Mission Olives, Burbank Lemons, Seedless Grapefruit. One mile north of Exeter, Cal. Frank K. Asano, Box 376, Exeter, Cal.

Nurserymen—Pot grown conifers, palms, shrubs and ferns for lining out or potting. Ballou's Nursery, Pasadena, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

Eureka Walnut Buds For Sale—Enter your order now for early delivery. E. Holve, Fullerton, Cal. Phone 214-W.

Budded Avocados—All varieties. Write for descriptive catalogue. Newbery Sherlock, R. F. D. No. 2, Pasadena, Cal.

Prune Trees 12c, Walnuts 30c. Cash Nursery, Sebastopol, Cal.

SEEDS AND PLANTS

Strawberry Plants of the following varieties: Gold Dollar (extra early, fine, our leader), New Oregon, "Morse" and the famous Etterburgs No. 80, and No. 112, price 75c (postpaid) per 100, \$3.50 per 1000. Foreman Bros., Corning, Cal.

Poultry, Hogs and Cattle Fodder Cost reduced one half by planting and feeding our (Sworn Pedigree) Luther Burbank Cactus Plants. \$50 per 1000; \$10 per 100. Free instructive cactus literature with feeding results. El Campo Co., 227 Story Bldg., Los Angeles.

Alfalfa Seed—New crop. You want the best. We grow it. We sell it. You buy it. Write or wire for quotations, samples and information. V. A. PETERSON, ALFALFA SEED COMPANY, ARBUCKLE, CAL.

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs, \$8.50 per 100; \$50 per 1000. Labranza Ranch, Athlone, Merced Co., Cal.

For Sale—First class re-cleaned alfalfa seed that has been inspected in the field by the Horticultural Commissioner, and is free from noxious weeds. Also choice Peruvian seed. O. C. Nordahl, Bard, Cal.

Strawberry Plants—Guaranteed pure bred Marshall, Gold Dollar, Klondyke, Early Ozark, Wilson, Magoon, Clarke's, \$2.50 per 1000. J. W. Vinacke, Canby, Oregon.

Thoroughbred Strawberry Plants—Early Ozark, Gold Dollars, Wm. Belt, Goodells, Kellogg Prize, Mars Halls, Magoons. \$2.50 per thousand. Mr. John Christensen, R. F. D. 2, Canby, Oregon.

Rhubarb Plants—We have some choice plants to offer in large or small lots. Get our prices. Currier Bulb Co., Seabright, Cal.

Peruvian Alfalfa Seed—Hairy varieties, also Algerian wheat. S. P. Huss, Yuma, Arizona.

TURKEYS

Mammoth Bronze Turkeys—Early eggs for hatching now ready. Some birds for sale reasonable. Hillside Ranch, R. F. D. 11, Box 579, Los Angeles.

Bourbon Red and White Holland Turkeys, Pearl Guineas and Toulouse Geese. E. A. McKinley, R. F. D., Ukiah, Cal.

White Hollands—Thoroughbreds. Buy your breeding stock now. Rockwood Farm, Box 201, R. 6, Santa Rosa, Cal.

RABBITS

Richey's New Zealand Red Rabbits won again at Riverside Fair 3 medals and 3 ribbons. Beautiful B. Rock Cockerels for sale \$5.00 each, from Blue Ribbon stock. MRS. C. A. RICHEY, R. 8 Box 557, LOS ANGELES. Send 25c for booklet "Making a Living on an Acre" and "Care of Rabbits."

WANTED

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis Minn.

Wanted—To hear direct from owner of good farm or unimproved land for sale. Buckingham, Houston, Texas.

Wanted—Second-hand pumping plant; deep well; 100 ft. irrigating. J. W. Coleman, Victorville, Cal.

BEES

Instruction Books and Prices, Bees, Supplies, Etc., Free. Spencer Apiaries, Ventura, Cal.

TRUTH
TALKS

Instead of common spur-gears,

LUBRICATED
ROLLER-PINIONS

are used on all

SIEVE-GRIP

Reg. U.S. Pat. Off.

TRACTORS

The rollers in the roller-pinions revolve on internally lubricated pins—no dust can get in to wear them.

They only press on the teeth of the big drive-gear—the real bearing surface is between the rollers and the pins. Friction is cut to the least possible amount and lubrication made unnecessary between rollers and gear-teeth.

This in turn lengthens the life of both rollers and gear.

Rollers and gear-teeth fit snugly together—no looseness and loss of power.

This is but one of the many exclusive features of

SAMSON SIEVE-GRIP TRACTORS

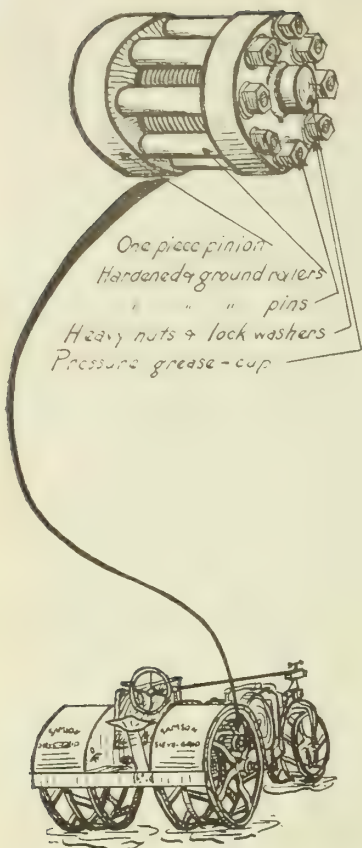

Sieve-Grip tractors are made in two sizes: a four to five horse-pull on the drawbar with ten horse-power for stationary work and an eight to ten horse-pull with twenty horse-power.

Let us tell you how a Sieve-Grip—"the tractor that works"—will cut power costs on your farm. Write us today and we'll put you on the mailing list for our monthly magazine "Samson Sieve-Grip Sitings." Ask for Booklet CC-1 Samson

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

HELP WANTED

"By the farmer and for the farmer" is one of the Cultivator's mottoes. In this department more than in any other we want it made true. There are hundreds of questions which come to the office asking for information and we do our best to get just what the inquirers wish. Very often questions come to us which can only be answered by the man actually in the field work who has had experience along the particular line in question. Now will our subscribers help us in this department. We want help, and subscribers from all parts of the state are coming to us each week for just such information as we know some of our readers have. For the best answer received during the two weeks from date of this paper a six-months' extension of time will be allowed on the subscription.

Here is this week's problem. Send us your answers:

Best Grasses for Pasture

I have about 100 acres of hill pasture land that has a poor quality of grass on it and lots of weeds. I have burned off all the open spaces where I can get to them and have broadcasted burr clover, perennial rye grass and Turkestan alfalfa. On account of the patches of brush I did not harrow at all but depend on the rain to beat it in. I sowed before any rain fell. Will this method be successful? Can you make any suggestion to get rid of the undesirable grass and improve the good grass? I want to raise calves and would like to know how much I can pay for hay to feed. My pasture will carry stock from February to June as it is now. If I can get a better grass started I should have feed longer. This would mean I would have to feed some hay in July, August and September, and all hay in October, November, December and January. I have about 30 acres of hay land and ten acres of young orchard where I can raise corn between the trees. How much hay will it take to feed a calf through the winter (four months) and what is the highest price I can afford to pay for hay to raise beef stock? My main crop is fruit, but I want to get my pasture land to working. What can you suggest?—Subscriber, Paso Robles.

We believe that if our Paso Robles subscriber could disc or harrow in this seed he would secure far better results, but if that is impossible we would suggest he seed very heavily to make up for waste.

* * *

We are always glad for comment or help from the subscribers but the special contest this week is only on the above query. Next week may bring another.

Onion Sets

In putting in onion sets is the result the same if I put them in some right side up and some wrong? It makes considerable difference in labor but will the big onions be perfect? If large sets are put out and they start to go to seed will good, large onions be produced if the seed stem is pinched off when small? What variety of onion is used the most for producing the small yellow or brown sets in California? Also, what time should seed be planted in this locality for sets?—Subscriber, Tulare.

Onion sets should be planted with the root end down if you expect to make large onions. If they are to be used only for green onions it is immaterial as to whether they are set upright or not. If the sets are thrown in hit or miss they make ill-formed, small-sized bulbs when grown. A set larger than one inch in diameter is not good for growing large onions as it is too far developed to regrow into

a perfect onion as it is very likely to run to seed and as soon as it has started the seed stock it is worthless as a good, large onion even if the seed stalk is pinched off. Yellow Globe Danvers and Australian Brown are the varieties used for sets in California. The seed is sown early in April at the rate of 75 to 80 pounds to the acre.

Horse Beans

Can you give me absolute information as to planting horse beans; when they should be planted, what kind of soil is adapted to them; how far apart to plant; how deep to plant, and what is the best variety that will find the most ready market?—Subscriber, Gilroy.

Horse beans are hardy and will do well on any good tillable soil. Plant in drills three to four feet apart. The Broad Windsor is the best variety for California conditions.—D. F. R.

Garlic and Lentils

Would like to ask a question in regard to garlic planting. I live in a mountain valley 70 miles north of Los Angeles, elevation 4000 feet, annual rainfall 30 inches, mostly in winter; considerable snow, ground freezes from one-half to one inch deep occasionally at night, but thaws every day, summer climate ranges from 55 degrees to 65 degrees at night to 80 degrees to 100 degrees days. Ground is nice and warm by May 10 to 15 and no frost until November 15 to 20, soil sandy loam, both heavy and light. Do you think I can raise garlic by intensive dry farming and when would you advise planting?

Could I raise lentils profitably?—Subscriber, Neenach.

Garlic can be grown in your soil and climatic conditions by putting out your sets in April in ground that has been plowed and cultivated thoroughly to conserve the winter moisture. They should grow well from that time on and give you a mature crop by the latter part of September.

Lentils have not been a profitable crop in Southern California. We would advise you, however, to plant a few and try them out, planting them as soon as any danger of frost is over in the spring.—D. F. R.

Planting Date Seed

Please tell me how to start date palms from the seed?—Subscriber, Seeley.

From "Date Growing" by Paul B. Popenoe, we quote: "The soil used for the purpose must not contain enough alkali to injure ordinary crops, and it will be best if it is nearly pure. California growers should select a clean, sandy loam, such as is available in many parts of the desert. Several methods of starting the seed have been found successful, and the one to be selected will depend on the grower's own desire. Flats or shallow boxes offer a convenient method of beginning and are particularly desirable if the grower has been a little slow in getting his permanent location ready. They may be transported easily from place to place and save a great deal of time, labor, and water in handling the seeds during the first part of their plant life. The seeds should be planted an inch or two deep and three or four inches apart, and the soil kept constantly moist."

Potato Worms

How may potato worms be de-

Better Make
Not MadeFor Water Deep Under
The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

GASOLINE ENGINES

We are distributors for International Harvester Hopper Cooled Engines, all sizes. Also Mounted Spraying Rigs and Wood Sawing Rigs, also Mogul Tractors. Write for complete catalogue today. When in the city, call and look over this line.

ARNOTT & CO., Inc.
112-18 S. Los Angeles St., Los Angeles

stroyed in seed potatoes?—Subscriber, Moorpark.

The potato worm is killed by soaking the tuber in water for 36 hours. In storage bins expose in a pan one and one-half to two pounds of carbon bisulphide to every 1000 cubic feet of air space. Do not permit any light or a lighted pipe in the room while there is any odor of the material remaining as it is very explosive.—J. W. M.

Pollenizing Bartlett Pears

Is it necessary to plant other varieties with Bartlett pears in order to pollinize the flowers and secure good crops? Have purchased 1000 Bartletts with 800 other varieties to plant in same orchard but am told that if there are plenty of honey bees near the orchard this is not necessary. I am isolated from other orchards, have good, deep, rich loam soil, northern slope, eight and a half per cent average slope, irrigation water 200 feet lift. Is it wise to plant under these conditions in Southern California?—Subscriber, Moorpark.

It is not necessary to interplant Bartlett pear trees with other varieties to secure good crops.

You do not state your elevation. If you have to do much pumping and lift the water 200 feet, citrus fruits would perhaps be more profitable, provided the temperature is suitable. Bartlett pears would no doubt be very profitable under your conditions provided you successfully combat the blight.—J. W. M.

Meat, Fresh or Dried?

Which is best for chickens and ducks, fresh raw meat, dried or cooked. I feed them rabbit meat.—Subscriber, Milford, Utah.

If no more meat is fed than the birds will eat immediately, it does not matter whether it is cooked or raw, but raw meat which is left on the ground to decay is poison. It would be well to cook the meat a part of the time for the sake of variety, and for young chicks it is safer. The only object to be gained by drying meat is to preserve it.—J. A. K.

Dead in the Shell

Out of 30 eggs set last October I only got eight hardy chickens. There were only a few infertile eggs, the rest showed fully developed chicks but dead in the shell. I sprinkled the eggs with lukewarm water just before hatching.—Subscriber, Milford, Utah.

If the climate in your part of Utah is as dry as most of California is in October, this fact alone may explain your poor hatches. A single sprinkling at the close of incubation does not supply sufficient moisture to keep the inner membrane of the egg from becoming tough and dry. It is a good plan in such weather to keep the dirt under the eggs moist by pouring water down into it occasionally. Lack of moisture, however, is not the only reason for the death of chicks in the shell. Possibly the breeding stock was weak or immature. When the eggs used for hatching are laid by pullets a great many chicks are lost in this way. Possibly the nest was carelessly constructed so that the hen could not keep all the eggs under her wings at once. Perhaps the hens were disturbed by mites or lice or for some other reason left the nest too often or stayed off too long. These premature deaths are one of the most perplexing problems in poultry culture.—J. A. K.

Feeding Chickens on Range

What more is needed in the way of food for chickens for egg production when they range on green alfalfa and barley stack? Feed kafir twice a day.—Subscriber, Holtville.

Alfalfa, barley and kafir do not con-

stitute a balanced ration. Your hens need meat in some form. The bugs they pick up partly supply this need, but unless they are unusually numerous are not sufficient. I should give them a hopper of dry mash to which they can help themselves at will or else give a liberal feed of wet mash once a day. A good mash formula for hens on such range would be: bran, two parts (by measure); middlings, ground oats, corn meal and beef scrap, one part each; ground bone, one-half part. With the mash always before them or given moist in the morning they will need kafir only for the evening meal.—J. A. K.

Oil Coating for Reservoir

Can a reservoir 150 feet square and five to seven feet deep, for holding water for irrigation purposes, constructed in coarse, sandy soil, be coated with oil so that it will hold water and how much oil will it take for a square yard? How should it be applied? — Subscriber, Warner's Springs.

In such soil we believe it would be a mistake to try to hold the water with a coating of oil. We will be glad to hear from subscribers who have tried such an experiment. If used we believe a very heavy oil should be secured, say with 75 or more per cent of asphalt. This should be applied hot and thoroughly worked into the gravel.

Almonds in San Fernando

Will it be profitable to plant almond trees in the San Fernando Valley and which is the better variety? Also, how much work is it to harvest them? Can I smudge to keep off frost?—Subscriber, Zelzah.

The San Fernando Valley is a large one. There are portions of it in which almonds have done well. The best answer to your question can only be secured from those who have made plantings near you. We hardly think frost, which is one of the greatest enemies of the almond, can be economically controlled by the use of smudge pots. The almond requires a cool winter season with a warm spring and no frost after blooming time. An early fall with a warm January and a frosty February means loss of the entire almond crop. On this point only knowledge of your local conditions can help in deciding.

Quince Tree Dying

I send specimens of leaves from my quince. What is the trouble with them? Other bushes near are also affected.—Subscriber, Orosi.

These leaves had a burned appearance, especially about the edges, but there was no indication of fungus trouble. However, we sent to Prof. Fawcett, who writes:

"I fear I cannot help you out much on this trouble. It is not any fungus disease with which I am acquainted. It

is possible that the tree is suffering at the roots or that it may have a bacterial blight farther back on the limbs from which these leaves were taken. The quince trees are sometimes quite subject to the same bacterial blight that attacks pears and apples. This is only a conjecture; the trouble could not possibly be ascertained certainly from these leaves."

Roup

My hens, White Leghorns and Barred Rocks, were three weeks ago in fine condition and laying well, when they were exposed to roup. Now about 90 hens and young pullets have the disease in various forms, bronchial, catarrhal and canker. Can you suggest treatment, or is the case hopeless?—Subscriber.

It is difficult to treat a whole flock for roup. Your main dependence will have to be upon sanitation. Do your houses lack sunshine? Have the birds been overcrowded? Are their sleeping quarters dirty or drafty or damp? Have they as much fresh air at night as you like yourself? Are the yards and houses on high, dry ground, or is there standing water about? Look the premises over and correct whatever is wrong. I am not familiar with the roup cure you mention. Probably it is as good as any. I have found nothing better for the catarrhal form of roup than the potassium permanganate treatment. Dissolve a few per-

During the construction of the transcontinental Telephone line by the Pacific Telegraph & Telephone Company, in 1914, a model 18 Yuba Ball Tread Tractor was part of their equipment.

The remarkable performances of this machine in the Nevada desert and what is known as "Humboldt Sink" are best told by repeating portions of the letter of Mr. O. R. Cole, who was Division Superintendent of Construction.

"I am pleased to state that very satisfactory results were obtained from the tractor. It was kept constantly in use hauling poles, which were loaded on two or three trailers, each ten or twelve miles from the railroad, a considerable portion of the hauling being over sagebrush and through sandy desert where there were no roads. Especially in the latter places did the tractor do good work, due to its large tractor tread. Our horses and automobile trucks were practically valueless in such country."

"The usefulness of the tractor was particularly noticeable when we crossed what is known as 'Humboldt Sink'. Our horses and gasoline trucks kept continually miring down, and it was necessary to do practically all of the hauling across the sink with the tractor."

The most critical judge, the engineer, found that the Yuba Ball Tread Tractor gave very satisfactory results, under the most trying conditions. This is the reason the Yuba Ball Tread Tractor is used for desert hauling; found cultivating the sandy orchards, and working the resistant adobe lands of the California rice fields.

Hops	

manganate crystals in a quart cup or lard pail of warmish water, just enough to redden the water. Into this solution dip the head of the affected bird, holding it under a few seconds so that the solution may be drawn into the air passages. Do this twice daily, and I think you will see improvement. When there is rattling in the throat a daily dose of quinine, one grain to the dose, sometimes helps, and a tablespoon of olive oil now and then is always good. Swab the canker spots with peroxide and if there are swellings filled with pus, open and cleanse with peroxide. There are roup cures galore, but the best of them only lock the door after the horse is stolen.—J. A. K.

Turkey Chicken Pox

My turkey gobblers have large, whitish sores on heads, almost closing the eyes. They have always roosted in the open and appear perfectly healthy. What is the cause and remedy?—Subscriber, Madera.

Your turkeys have chicken pox, which is so contagious that it may be carried from flock to flock on clothing or utensils, and is believed to be disseminated by vermin of various kinds. Procure from your druggist some calcium sulphide tablets. You can probably get one-grain tablets. If you cannot, you will have to use the powder. This drug is best given in a moist mash, once a day, one grain to each bird. Give daily for a week then skip a few days and repeat if necessary. The crust on the sores should be removed and the spots touched with a feather dipped in creolin. In light cases greasing the head with carbolated vaseline is sufficient.—J. A. K.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Citizenship of Child

Parents with child of four years immigrated to the United States in 1885. Father took out in 1892 the final naturalization papers. Has the child become a citizen also?—Subscriber, Escondido.

The naturalization of the father operates to confer the right of citizenship upon his minor child who though born abroad is dwelling at the time of his father's naturalization in the United States.

Collecting Wages

Did development work on ranch for nonresident, to be paid so much monthly. Payments were kept up 18 months. Last one made March, 1915. Owner sold ranch and improvements, tools, etc. I have in my possession wagon, scraper and harrow and some tools that would about cover bill. Can I attach and hold these until paid and at what expense and how go about it? Owner was a teacher getting good salary and owning own home.—Subscriber, Rio Bravo.

In view of the fact that your former employer sold his land as well as the implements thereon and you hold the said implements merely as the

servant of your former employer, you would have no right to touch these goods, as at the time when you levied your writ of attachment they belonged to the purchaser. Apparently your sole right of action is against the former employer. If this employer is resident of the state of California and the amount which he owes you is less than \$300 you can bring suit in the justice's court in the township in which you reside and send the summons for service upon your employer elsewhere, and thereafter prosecute the suit to judgment. If your employer is a school teacher you would no doubt be able to obtain payment of your account by filing transcript of the judgment with the auditor of the county wherein he teaches. If he is a non-resident of the state, however, you will have exceeding difficulty in collecting your account.

Storage of Explosives

How far must a manufactory of explosives be from residences in town, city or county?—Subscriber, Azusa.

The storage of explosives is entirely governed by county or municipal ordinances to which you would have to refer.

Water Stock

When my land was subdivided there were two shares of water stock to each acre. Had the owner of several years back the right to sell this water stock without the land?—Subscriber, Azusa.

There are some water companies wherein it is provided that the shares of water stock are appurtenant to the land and cannot be sold separate from that land. Other companies, however, are not so formed. You should look up the articles of incorporation and by-laws of the water company in question, which will probably give you complete answer.

Buying on Contract

About four years ago I bought a piece of land, contracting to pay so much cash and the balance so much a year. So far have made all payments on time, but there will be a payment come due in a few days and I can pay only half of the amount due, making the balance in six months. Should the seller not allow me to do this what steps can I take to keep from losing this place? I have spent considerable money to improve it besides making payments and do not want to lose?—Subscriber, Brawley.

I bought house and lot under contract (not recorded) and have made several payments. How can I get out of this deal and get some of my money back? The owner refuses to return anything.—Subscriber.

In answer to these two questions and because of the many similar questions received Mr. Stanton has given a very full answer.

The purchaser of land under contract should invariably record his contract for two reasons: First, there is no obligation in law that the vendor have title to the property at the time he enters into a contract to sell, and many cases have been known where the vendor did not have title to the property and where incumbrances which were against the property were foreclosed and contract purchasers lost all payments they had made; second, by recording the contract an interest in or to the property shows upon the records and under the recording laws of this state—and instrument first recorded is first in priority—thus in case the contract is not recorded and the purchaser has failed to make his payments the vendor may simply execute a deed to the property to some third party and all right of the vendee in or to the property is thereby cut off; whereas if the contract is recorded the vendor is obliged to bring action against the vendee for rescission of his contract of purchase for reason of the fact that

"AMERICA FOR ME"

'Tis fine to see the old world and travel up and down
Among the famous palaces and cities of renown;
To admire the crumbly castles and the statues of the kings,
But now I think I've had enough of antiquated things.

So it's home again and home again,
America for me!
My heart is turning home again, and there I long to be;
In the land of youth and freedom beyond the ocean bars,
Where the air is full of sunlight and the flag is full of stars.

Oh, London is a man's town, there's power in the air;
And Paris is a woman's town, with flowers in her hair;
And it's sweet to dream in Venice, and it's great to study Rome,
But when it comes to living there is no place like home.

I like the German fir woods, in green battalions drilled;
I like the gardens of Versailles, with flashing fountains filled;
But, oh, to take your hand, my dear, and ramble for a day
In the friendly western woodland, where nature has her way!

I know that Europe's wonderful, yet something seems to lack;
The past is too much with her and the people looking back.
But the glory of the present is to make the future free—
We love our land for what she is and what she is to be.

Oh, it's home again and home again,
America for me!
I want a ship that's westward bound to plow the rolling sea
To the blessed Land of Room Enough beyond the ocean bars,
Where the air is full of sunlight and the flag is full of stars.
—Henry Van Dyke.

THE HOME ROAD

By Elia W. Peattie in Youth's Companion

PRAIRIE, prairie, prairie, as far as the eye could see. No floor could be more level or treeless. A month ago it had been green, but now the grain had been gathered, and the denuded fields, which were only little patches in the vast stretches of yet unbroken plain, were tawny gold in hue. The sky was blurred with dust, the silence absolute. No bird sang, for birds do not come where there are neither trees nor water. The little sod house of one room with its door facing the east stood out like a wart on the unlovely face of the earth.

Out of the door of the hut came a woman and two children. The boy was ten years old, the girl seven, the woman no more than 30; but although she was so young, her face was tanned to the hue of leather and her eyes were sun-faded and wind-stung; yet her lips were tender, her smile gentle, and her faded hair rippled back from a broad and lovely brow.

"It's time to play, mother," said the girl. "You said you would play when the shadow lay in front of the house."
"Of course I'll play now, dear. Don't I play with you every day?"

"Some days are most like two days. Are days as long everywhere as they are here?"

They walked toward a broken down

cart that stood before their door. The wheels held, and the thills were still attached to the body of the vehicle, but the seat sagged and the floor was half gone.

"What game shall it be today? The same one?" The mother seemed to be hoping that the children would say yes.

"The same one," the boy answered. "There's no game like the home-road game, mother, is there?"

"The thills are turned the wrong way," said the mother. "They must be turned toward the east if we are ever to reach home."

"I'll turn them—I can do it alone. You let me do it, mother."

Ann Bliss stood aside for her son to wheel the cart round; she let him assist her to the seat and she reached down to help her little daughter up beside her.

"You in the middle, mother," said Jim.

"No, no. I'll drive better sitting at the right, won't I?"

They played the game very seriously.

"It's a long way for one horse to carry us," continued Mrs. Bliss, "but we've a pretty good horse."

"And plenty of feed for him in the sacks!" cried Jim.

"Oh, plenty! Of course we'll water him very often."

"Hurry up, mother!" broke in Hallie, eager to be done with the preliminaries. "Can't we start now?"

"We're off!" cried Mrs. Bliss. "Hurrah!"

"Hurrah!" cried the children. Hallie clapped her hands. They all laughed together softly, breaking that solemn silence of the plain.

"We're off," repeated Ann Bliss more gravely, "and here we go over the prairie. It's flat and it's hot, but we keep driving and driving, because we know that by and by we shall be coming to the home road. Once in a great while we reach a cabin, and then we call to the people and they come out and ask us to spend the night with them. They are very kind, and give us something of all that they have. They have boys and girls, and we play with them, and when we go on the next morning, we hate to leave them, because they have become our friends; but we can't stop long—"

"We have to keep going on!" cried Jim. "'Cause we're going home!"

"We're going home," said Jim's mother. "Though two of us have not seen home at all, yet we all know perfectly what it is like. So we keep driving and driving. After a while we come to some rivers, and we drive through them, for they are shallow and broad. We love to hear the water singing, and we are glad there are trees growing beside the rivers. We can hear the leaves rustling, and when there is no house to take us in we lie all night underneath the trees. Then in the morning we build a little fire and cook our food. After that we go on again."

"We keep going on and on, don't we?" asked Hallie.

"On and on, and because we are driving with only one horse, it takes us weeks; but at last we come to the

Clubbing Price List Season 1915-1916

This list is prepared annually for the benefit of Cultivator subscribers. The prices given allow our readers the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to the Cultivator (Class 18) be added at 90c (regular price \$1.00 per year).

We can supply any periodical published. The lowest price of any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage, and prices must be obtained by correspondence. Subscriptions may be either "new" or "renewals" (except where otherwise stated in the list), but it is important that this information be given in each case.

The pricing of various combinations of magazines is a simple matter; all are listed according to class number, and this class number multiplied by 5 gives the cost price.

Solid Aluminum Griddle
—Full 10½-inch Size

Labels
FROM 50 CENTS
WORTH OF KARO WILL
SAVE YOU \$1.40 IN CASH

Regular Retail Price \$2.25

\$2.25 Aluminum Griddle Offered For Only 85 Cents
And Labels From 50 Cents Worth of Karo

GET 50 cents worth of Karo from your grocer and send labels from the cans to us with 85 cents and we will send you this \$2.25 Aluminum Griddle by prepaid parcel post—a clear saving of \$1.40.

Thousands of housewives all over this country have already taken advantage of this offer—for you may be sure that the women of this country know a real bargain when they see one.

At great expense we are seeking to place a Karo Aluminum Griddle in the homes of all Karo users, so that Karo—the famous spread for griddle cakes and waffles—may be served on the most deliciously baked cakes that can be made.

So if this money-saving opportunity appeals to you and if you want your family to use Karo, the most popular syrup for griddle cakes—then get 50 cents worth of Karo from your grocer and send us the labels and 85 cents. You'll get the Aluminum Griddle by prepaid parcel post.

Remember—this Solid Aluminum Griddle needs no greasing. It doesn't smoke up the kitchen. It can't rust; it is clean; and cakes baked on this griddle are more digestible than when fried in the old way.

If you haven't sent for your griddle already, get 50 cents worth of Karo from your grocer today, and send us the labels and 85 cents (P. O. money order or stamps) as quickly as possible so as to be sure of getting yours.

We will also send you free a copy of the famous Corn Products Cook Book. Put your order in as early as possible—for the griddles are going fast.

biggest river of all, with hills beyond it, and when we have crossed the hills we know we are getting toward home. Jim keeps asking me how I know the home road, and Hallie keeps asking me, and I say, 'When you see a house with vine-covered gables standing where three roads meet, then you must take the road that runs straight east, and that will be the home road.'

"I'll take that road," said Jim. "You couldn't fool me about that road. It's in the middle like, isn't it?"

"It runs east, Jim, and there are trees all along the way. The Ealings have willows along their farm, and the Wilcoxes have poplars, but we have elms."

"What is an elm like, mother? Is it better than a willow or a poplar?"

"It is a big tree, like a plume, and so strong that it seems to be a friend. It does not sing so loud as the poplar, and it is not so beautiful as the willow in the spring, but, after all, it is the best of the three."

"Is an elm as tall as our house?" asked Hallie.

"Oh, it is many times taller than our house! It is a beautiful green. If only you had seen any sort of tree at all I could make you understand better what it is like; but never to have seen a tree—"

The woman broke off her story. For a moment she sat staring before her at that relentless plain. The distance melted into sallow dust; the arching sky was drab with it.

She spoke almost as if talking in a dream.

"We go on beneath the elms. There are blackberry bushes growing beside the road, and sweet clover is everywhere. You can see the corn tossing and rippling like the sea, and hear the birds. The robin sings and the meadow lark whistles. Best of all, you can hear children calling to one another, and the roll of wheels along the road. Women are laughing, and men are talking to their horses and whistling to their dogs. The air is full of sounds. There is a spring in the bank just as you turn in at the wagon gate, and you can hear that whispering. In the night, now, I often hear it whispering."

Her lips were dry, and the children heard a little catch in her throat. Jim drew closer to her.

"Don't talk about 'now,' mother. Please!"

"No," she said, "I'll not talk about 'now.' I'll talk about the time to come, when we are turning in at the wagon gate. We are there, you see. Jim has opened the gate for us, and we are driving through. The Persian lilacs are so high that we can't see the lower story of the house at first."

"Only the upper story," broke in Jim. "Five windows all in a row."

"With the sun shining on them—"

"Making them gold!" cried Hallie.

"And vines are climbing round them, and inside white curtains are fluttering. We go on round the little turn and then we get past the lilacs. We can see the goldenglow and the hollyhocks, and then the lower story of the house. There is the porch, and through the open door we can look down the wide hall. It is all green in the hall—the walls are green, the floor is covered with green carpeting. A tall clock stands opposite the fireplace. No one is in the hall, and we go in as quietly as we can, to surprise grandmother. Hallie wants to stop at the doors of the different rooms. I try to drag her on, but I can't keep

her from taking a look at the parlor, where the chairs are with the carved swans' heads. Jim can see the goldfish swimming in the globe in the dining room, but I'll not let him stop. I take him on down the hall, and we all come out on the rear porch, which is even pleasanter than the front one. There are crimson creeper roses on the trellis, and the old splint-bottomed chairs have cushions in them. There is a hammock and a swinging couch, and a table with grandmother's workbasket on it. At first we can see no one, and just as we are about to call out, a woman comes toward us from the garden."

"Grandmother," whispered Hallie.

"She is tall, and her hair shines like silver. She wears a white dress, and she carries a basket of flowers. She is singing softly, and her voice is like sad, soft bells, and that makes us all know that she is thinking of us—of her daughter who left her home 12 years ago, and whom she has not seen since, and of her grandchildren, whom she has never seen at all."

"Then," broke in Jim softly, "she looks up—"

"She looks up," added his mother, "and—"

"Sees us," said Hallie.

"She sees us, and at first she stands still—she is so puzzled to find strangers waiting on her doorstep smiling at her like that. Then a beautiful light comes into her face. Though you two are so big, though I have turned so brown and ugly—"

"No, you haven't, mother!" cried both children.

"She knows us. She drops her flowers. They fall on the white path. Then she puts out her arms, and we go down the steps to her."

"I jump down all of them at once," declared Jim.

"I put you first, because I love you so," resumed Ann Bliss. "I let my boy and girl go to her first, although now that I see my mother, I, too, feel like a little girl. Then we are all in her arms. They are soft and white,—her hands are like snow,—and she leads all of us into her quiet house. We go to her sitting room, and she takes off our hats, and we sit down before her. None of us can talk, though we have a thousand things to say. Then—I think—it begins to rain a little, very softly; not a fierce, terrible storm such as we have here. No, the rain falls like music on the trees and the flowers, and the birds sing sweeter than ever. And we are at rest—we are at the end of Home Road."

The three were silent for a long time. The sun which had been well into the west when they left the cabin, began to plunge from sight. A chill crept over the plain.

"It is almost the last of our hot days," said the mother. "Back home we should have called this Indian summer. In a little while the cold winds will be blowing. Before we realize it, the winter will be here."

"They will be having beautiful fires in the fireplace in the wide hall back at home, won't they?" asked Jim.

"Yes, wonderful fires of wood. There will be apples and nuts to eat in the evenings—"

"Oh," cried Hallie, "is that father?"

Some tiny black creatures were crawling along the unmarked road that led to town. They were horses—almost certainly the horses of James Bliss, since other persons seldom came that way.

"It must be father," said Ann Bliss.

"Come, we'll have his supper ready for him."

"I'll turn the thills of the cart again, mother. He wouldn't like to know we'd been playing the home-road game, would he?"

"It would make him feel sad, son. It is foolish of us to play it, I suppose. You'll be drawing the water, won't you, Jim? Come, Hallie, you may set the table. I have the supper to get. We must have everything ready for your father when he comes in; remember, he has been driving 40 miles in this dust. It's not quite dark yet, but I think I'll light the lamp now and put it in the window. He likes to see it, even if it's not needed. It cheers him up when he's tired to know that we're still thinking of him."

"He wouldn't need cheering up so much if he could hear voices on the road, would he, mother? Or if there were other wagons passing him, the way there would be on the home road?"

Ann Bliss did not reply. She had let her mind carry her beyond the dreams that can be put into words into the dreams that are wordless; but as she dreamed, she worked.

Presently they heard the wagon. Jim and Hallie ran out with a shout. Ann Bliss heard their father's voice answering them; heard them unhitching the horses from the wagon; heard the horses being watered at the well; heard Jim running with them to the corral.

The door opened and James Bliss entered. He was only a little taller than his wife; a man with more force than grace, who yet carried his head well above his broad shoulders. His face, his hair, his clothes were covered with dust; but his blue eyes were as fresh and as clear as pools.

"Ann," he said. It was his brief salutation—his form of caress.

"Safe home?" said she, smiling. The wistfulness had not left her, but she was a little shamefaced before this man who lived in his "now," as Jim had called it. She knew he would not have chosen to have her entertain the children with visions that made her homesick.

"Is this fresh water, Ann?"

She nodded.

"Jim drew it for you, James."

He drank a glass. Then he filled the glass again and drank more slowly.

"Such a well, Ann! I've had many drinks of water since I left home, but not one of them touched the spot. That's what I said to the neighbors, 'You ought to have a drink from our well.' I went to see about a windmill while I was in town, and I've decided now that we can afford to put one in. By spring we'll have it running. Then we'll irrigate in a small way. You can have your garden, Ann."

"O James, do you think it will grow?"

"Do I think it will grow? It will grow like a miracle. The trouble will be to keep it from growing. Supper ready?"

He stepped to the door and called the children. They came in with their arms full of things that they had taken from the wagon—cans and boxes of food, small sacks and bundles. - While he was emptying Hallie's arms for the second time, Jim came running in with a long package in his arms.

"Oh, those weren't to come in, son," said James Bliss. "They're much better outdoors where it's cool. In the morning we can see to them."

"But what are they, father?"

"Little trees, Jim—elms."

"Elms!" Ann Bliss let drop the word. The children were very still. One might have thought they were in the presence of something holy.

"What is it?" asked James Bliss, startled.

"They have never seen trees," James," said Ann, softly. "Will you undo the bundle?"

The man tore off the gunny sacking and the children looked at the saplings. "There are not nearly so large as the house, mother!" cried Hallie, in anguished reproach. "Are these really elms?"

"Poor child!" murmured the man. There were tears in his eyes. There was much that went on in that house that he did not quite understand—that, perhaps, he did not choose to understand; but he comprehended this.

"But they will grow to be much taller than this house, Hallie," he said gently. "They will have many great branches, and all summer they will give shade. Then the birds will come here, and other little creatures—squirrels, perhaps. I will send for some squirrels. They are almost as good as children, they are so playful."

"Supper is ready," said Ann. Her voice was toneless, like that of one who dares not betray her thought. They ate in silence, for dreams had gained the mastery over them all; but the woman knew, and the children knew, that it was the man who had brought their dreams into their "now."

After the supper dishes were cleared away, the children and the weary man went to their beds. Ann Bliss sat sewing for a time by the lamp. Then, when she was sure that all were sleeping, she went out, drew up pail after pail of water from the well, and drenched the young trees with it. She piled more wet earth about their roots. Then she walked up and down on the trampled, hard earth before her sod cabin.

The arching vault of heaven, cloud-

"John"

"We are almost out of chocolate. Get a 3-lb. can of Ghirardelli's Ground Chocolate. Don't buy the bulk kind."

And John "obeyed orders" cheerfully, for of all the members of the household, John, the "boss," likes his breakfast cup of Ghirardelli's the most.

He knows what a delicious, sustaining beverage it is, what wonderful cakes, puddings and cookies his wife makes with its aid. He also knows that it gives the highest food value for the man who works hard, for the woman who must always be well, for children on the grow.

Order from Your Grocer Today

Ghirardelli's The Only Ground Chocolate

In 1/2-lb., 1-lb. and 3-lb. hermetically sealed cans. There's a double economy in buying the 3-lb. can.

HAY

Under date of December 4 Scott, Magner & Miller say:
Receipts for the past week were 2861 tons, the previous week 2729, and the week preceding 2663 tons.
Fancy grades of wheat are very scarce and the same grade of red oat are almost nominal and will bring top figures whenever available. Interior trade is very good and we believe will continue so throughout the season. More hay is being shipped into the interior at the present time than is being sent to the San Francisco market. Southern trade continues good. Export trade is normal. Alfalfa is in very light supply with

the demand good. Straw is dull and inactive.

We quote the average wholesale prices for hay in carload lots on today's market as follows:

Fancy Wheat Hay (11 bales).....	17.00@18.00
No. 1 Wheat or Wheat and Oat.....	12.00@15.00
No. 2 Wheat or Wheat and Oat.....	10.00@11.50
Choice Tame Oat.....	15.00@16.50
Other Tame Oat.....	10.00@14.50
Wild Oat.....	8.00@11.50
Alfalfa.....	10.00@14.00
Stock Hay.....	6.00@8.00
No. 1 Barley Straw.....	25@40

GRAIN

Citrus Fruit Market

LOS ANGELES, Nov. 8, 1915.

Oranges are selling approximately 50 cents better than a year ago this date. There have not, however, been as many Navels shipped, but it is felt that with better grade of fruit there will be an increased demand later as the larger supply of fruit is to be had. Floridas are not as fine a quality as usual, which is a material aid to the best grade of Californias. One trouble with the Californias is the matter of size. They are running very large, the trade having preference for the smaller sizes. Present prices are running around \$3.25 f. o. b. California.

The state horticultural commissioner's crop report issued December 6 gives the following percentages or normal as his estimate for this year's orange crop: Fresno County 65, Kern 50, Los Angeles 80, Orange 90, Riverside 50, Sacramento 100, San Bernardino 75, San Diego 80, Santa Barbara 100, Tulare 70, Ventura 70. Lemons: Los Angeles 100, Orange 105, Riverside 95, Sacramento 100, San Bernardino 85, San Diego 75, Santa Barbara 100, Tulare 70, Ventura 85. The estimate for grapefruit varies from 80 to 100 per cent in the various counties.

There are a few foreign lemons still arriving, at present only about 17,000 boxes being afloat around pier. Prices are fully as good as during any preceding year this date. Practically all fruit is being shipped as soon as properly sweated after picking. Prices range around \$3.00 f. o. b.

Shipments

Shipments of oranges from Southern California since November 1, 1915, 614 cars, lemons 449, total 1063. To same date last year, oranges 412, lemons 354, total 766. From Central California since November 1, 1915, oranges 1260, lemons 49, total 1309. To same date last year, oranges 1494, lemons 66, total 1560. From Northern California points, oranges 189. Last year same date, 187.

NEW YORK, Dec. 6.—Four cars navels, two cars Valencias, four cars lemons sold. Market is strong on both oranges and lemons. Cloudy.

VALENCIAS—	
Mother Colony, S.T. Ex., iced.....	\$4.65
Carnival, S.T. Ex., iced.....	5.10

California casabas, about cleaned up, no quotations today.

THE HOME ROAD

Continued from Page 581

less and as deep in color as the ocean, was glorious with stars. Beneath its splendor she felt her soul grow. New visions of flowers in the desert, of trees along the unmarked road, of the homes of happy men in the grim solitude where her man was now fighting his battle alone. The service of the pioneer to man was revealed to her, for that one hour, as the highest of all services. She walked with her head lifted high, contemplating the stars that offered their magnificence, not for the future, but for the present.

Suddenly, half laughing, she ran toward the broken down cart in which she and the children played their "home-road" game. She dragged it after her to the rear of the house. An axe lay there. She lifted it, and shattered first one thill and then the other. She broke in the floor, and knocked off the rickety seat. Never again could they sit in it, with their gaze strained eastward.

She was still laughing—or weeping—she could not be sure which; but she was happy. At last she knew herself as the fit mate of a pioneer, the full mother of children who would use their "now" to create comfort and beauty in what had seemed to her until then no more than a disconsolate wilderness.

PLAN OF ORGANIZATION

Continued from Page 563

As incidental to the carrying out of the foregoing purposes, to acquire information concerning the lima bean industry, its soil, its production, the manner and method of distributing and marketing the lima beans, the localities in which the same are consumed and the prices for which the same are sold; to establish a standard of quality and to market said beans, if it is desired, under a trademark indicative of such quality; to advertise its product and by all other lawful and legitimate means and methods to further the best interests of the growers of lima beans and to provide a wider and more extended market for such crops.

The articles here will determine on what basis the local associations may vote in shaping the policies of the central association. These local associations may vote either by one vote to each association, or the articles may provide that the local associations may have a vote in the affairs of the central association

proportionate to the tonnage handled by each of the local associations through the central association. Personally I prefer the equality of voting power because I believe it is more democratic and more in spirit with cooperative marketing, at the same time there are other able reasons for the contrary view, and which ever is adopted can be successfully made a part of the proposed plan.

LEGAL QUERIES

Continued from Page 578

he has not complied with the terms thereof.

Actions brought upon these contracts of purchase are upon the equity side of the court and as one of the maxims of equity is "Equity abhors a forfeiture" the court very frequently gives the vendee additional time in which to pay the balance due. The contract purchaser has an interest in the property, which he is entitled to sell and this is the most frequent method of realizing upon the money that has been paid in. Although a contract usually specifies that time is of the essence thereof, this provision has been held to be waived where a vendor has accepted payments made after the exact time upon which by the contract they are due. Frequently if the contract is recorded and a suit is thus necessary in order to regain the property by the vendor an amicable and equitable settlement can be made as people do not generally desire to bring law suits where they can otherwise obtain substantial justice nor do they desire to appear in court in the character of insisting upon strict performance in such method as apparently to take advantage of the necessities of people in such cases as above.

A deed and mortgage are undoubtedly the best method for the purchaser as thereby he is assured of his title to the property and upon a mortgage foreclosure he has a year in which to redeem. Under the contract he is not entitled to any redemption and as a usual proposition he has had no search made as to the title to the property; frequently the vendee even neglects the ordinary precaution of recording his contract, so that the contract method while it has grown into considerable use throughout this state, benefits rather the vendor than the vendee; however, it is more beneficial to the vendee than is the trust deed method, except in this case, that the trustee under a trust deed usually requires a considerable fee upon the foreclosure of the trust deed which frequently operates as a deterrent upon the holder of the note. In case of the trust deed, however, the purchaser can usually be assured that upon payment made he will receive clear title to his property as that is a matter which the trustee usually looks into for his own benefit. In any individual instance it would be well for the contract purchaser who feels that he is embarrassed by the owner or in danger of loss of property through failure to make prompt payment, to visit a good attorney in his locality and lay the whole facts in the case before him, as a small fee thus expended in advance would probably be the means of saving a great amount of trouble, worry and expense.

THE ARMSTRONG NURSERIES

The 1916 catalog of the Armstrong Nurseries surpasses all the other beautiful catalogs gotten out by this nursery. Mr. Armstrong is nothing if not artistic and his talent is shown in this 64-page book. It is not only a thing of beauty but it contains a world of information for every planter. A paragraph is given to each variety of fruit, its time of ripening, character of the fruit, as to whether the plant is a strong or vigorous grower, size of the tree or plant, and many other valuable points.

Best of all, there is back of the catalog a business founded upon the principle, "Good Service and Perfect Satisfaction." Write Mr. Armstrong regarding this catalog.

Mr. Claud D. Tribble writes that the Tribble Nurseries are now growing at their own trees and on new land near Lodi, San Joaquin County. The Tribble people have built up a name for supplying thoroughly good nursery trees and they are specializing along the line of nut trees. Their exhibit at the 1914 state fair comprised more varieties of nuts than those of all other exhibitors combined.

Veterinary Queries

Anasarca

We have a horse that has been sick for some time with kidney trouble. He swells up and then swelling goes down and comes back in another place. First his hind legs swelled and he was so stiff he could hardly walk, then his head swelled, then between his fore legs and half way back on his stomach. Now it is between his hind legs and about half the length of his stomach. Would like to know what can be done to reduce the swelling.—Subscriber, Torrance.

For lack of a better name we will call it anasarca, a term that is often used in referring to a complication of troubles that often follow cases of influenza and manifest themselves with such symptoms as you describe. Perhaps it would be better to say that often after mild cases of distemper or influenza the blood of the animal is left in a poisoned condition and the symptoms are manifested by swellings that shift about from one part of the body to another and disturb the action of the different organs they happen to be nearest. The following treatment will usually eliminate the trouble. Get of your druggist: carbolic acid, two drams; alcohol, two ounces, and enough water to make eight ounces. Mix. Give half an ounce morning and evening on the tongue or mixed with half a pint of water as a drench. During the time you are using this medicine also give the following dose every other day until five doses have been given: Epsom salts, six ounces; common salt, two ounces, and powdered nux vomica, two drams. Give this dry on the tongue by raising the horse's head as when giving a drench and putting a tablespoon at a time well back on the tongue until the dose is all given. The above amount is for each dose.

Scours

I have a heifer nearly 13 months old that has been scouring for nearly two months. For a time she did not seem to mind it much but is now getting quite thin. She does not eat very much although she still eats hay regularly and does not seem to be in great pain. Have tried several remedies suggested by neighbors and some have partly stopped it for a brief time only. I would like to know what is wrong and what to do.—Subscriber, Napa.

Scours as you describe it may be due to any one of many diseases, as chronic indigestion, tuberculosis of the bowels, worms of several different kinds, and a more recently discovered chronic bacterial dysentery sometimes called John's disease. This latter is not well understood yet and its treatment has not been very successful. In your case would advise first emptying the bowels by giving the following: Aloin, one ounce; turpentine, three ounces, and raw linseed oil, one quart. Mix and divide into two doses. Give as a drench 24 hours apart. Follow this by giving once a day for a week one teaspoon of zenoleum dissolved in a quart of water as a drench. If this fails please advise us and refer to this article; giving the date of the paper it appears.

GERMAIN'S POULTRY SUPPLIES

The Germain Seed & Plant Company is now mailing its special poultry supply catalog. Everything for household pets is to be carried this season by the Germain people. Incubators, brooders, remedies, condiments and all kinds of supplies and appliances needed in the poultry yards are illustrated and described. If the Cultivator is mentioned this catalog will be sent without cost.

Note the straight, strong trunks, the height, size and well-formed growth of these Stark City grown 2 year apple trees. All our trees are hardy and specially trained in the nursery row to develop heavy, wide-spreading roots, and well-balanced, symmetrical trunks and heads.

William P. Stark inspecting outgoing shipments. Every operation is done by skilled experts under the direct supervision of William P. Stark, whose 35 years experience assures you tree quality such as you get nowhere else. We use the same painstaking care in grading, inspecting and packing the trees as in growing them.

Our "3,000 Mile Package" brings the trees direct to you, fresh, full of life and vigor—no rehandling, no exposure, no drying out of roots or tops. The trees reach you in perfect condition for planting. We ship thousands of trees all over the world in these "3,000 Mile Packages" every season.

"Buy Your Trees Direct!"

—says Uncle Sam

"If the farmer makes his purchases direct from the nurseryman he will save the expense of the agent and is less liable to the mistakes in injury that may occur through repeated handling."

—United States Department of Agriculture—Farmer's Bulletin No. 113

30,000 Fruit Growers Saved 1/3 to 1/2 Last Year

Read What They Say! Then Write For Book!

Buying Direct The Right Way—"Your way of selling direct to the planter is the correct way. It pays to get the best stock regardless of price."—W. T. Weir, Henderson, County, Illinois.

No Agents—"Your idea to sell direct to consumer and cut out agents is a sure winner with careful, cold headed thinkers. I have fared badly in buying from agents."—H. E. Tankey, Rockingham Co., Virginia.

Wonderful Roots—"I have planted trees for 30 years, but never did I obtain a lot that had such perfect root systems with plenty of fibrous rootlets as those I got from you. The care with which you form the tops of your two year trees will certainly recommend them to experienced planters."—Joseph Gerardi, Jerseyville, Ill.

Would Have Gone 10 Times as Far—"I never saw better packing than yours. The bundle would have gone 10 times as far. Have seen lots of nursery stock shipped in here this season with nothing but an old burlap bag around the roots."—Edwin A. Brooks, New Hampshire.

Withstand Drought—"The J. H. Hale trees were planted the 27th of May, when peaches were nearly as large as marbles on the trees. All are alive and looking fine, notwithstanding the greatest drought ever in this section."—H. C. Barrett, Bedford Co., Virginia.

Hardy Stock—"All the trees are in good condition, the growth being an exception in this locality where others set out are practically dead. This condition is due to particular care, but the stock was hardy to start with."—J. F. McDonald, Queen's Co., New York.

Delicious Apple—"The Delicious apples from my trees are as pleasant to the taste as a sweet orange, fully as handsome, and should be in great demand by those who cannot eat an acid apple."—A. D. Van Cleave, Niagara County, New York.

J. H. Hale Peach—"The J. H. Hale is the king of the peach world. We picked as many as 300 peaches off some of the trees—many trees 5 to 7 ft. in height. Fine flavor—large size. Some so big I couldn't get them in a glass jar with a 3/4 inch opening."—F. G. Baker, Los Angeles Co., Cal.

William P. Stark's and J. H. Hale's Experience to Help You

These two men stand foremost in America in their respective spheres as nursery-men and fruit-growers. Think what their counsel and help is worth to you. They have given the best of their practical knowledge and ripened experience in the new 1916 William P. Stark Book. Be sure and write for it today.

William P. Stark Nurseries Box 773, Stark City, Mo.

You can't forget our address. The town is named after our Nurseries.

On account of their greater vigor and larger, heavier root systems, William P. Stark trees, when planted in the orchard, establish themselves more quickly, make a faster, thriftier growth and often come into bearing a year sooner than trees with only average roots.

Send for New 160 Page Book—FREE!

Totally unlike any other nursery catalog. Gives complete description of fruit, season of ripening, where each kind does best, which are best money-makers, habits of growth, right planting distances, etc. Illustrated with over 200 photographs. Same low prices to all. Coupon or letter brings your copy FREE by return mail.

J. H. Hale peach trees are grown and sold exclusively by Wm. P. Stark Nurseries.

"I Order My Trees From Stark City"

Because I get

- Hardy Ozark grown trees
- Doubly guaranteed true to name
- Larger, heavier root-systems
- Shipped in the William P. Stark '3,000 Mile Package'
- And at 30 to 50% less than agents charge me.

It's the Safe, Sensible Money - Saving Way

With the William P. Stark catalog before you, you can pick out the fruit-trees, berry bushes or ornamentals you need, leisurely, thoughtfully, with no tree-peddler at your elbow to hurry you into buying something you don't want. You know every variety is the best of its class whether it be apple, peach, pear, plum, cherry, bush fruits, strawberry, roses or ornamentals. And you know the direct-from-nursery prices, printed in plain, bold figures underneath each variety, are the **lowest possible consistent with quality**. Make the saving. Get better trees. Buy direct from William P. Stark, Stark City, Missouri.

Horticultural Legislation

Address by George H. Hecke Before State Fruit Growers Convention at Visalia

IN enumerating what seem to me some of the faults of our present horticultural statutes I wish to take my part of the blame in advance, for I have had my opportunities of helping to correct these defects along with the other fruit growers and horticultural officials of the state. I wish to remark that a majority of these enactments are within themselves strong and effective. Their formulation shows high initiative capacity and understanding of conditions. In their relations to each other they are often weak, their lack of uniformity showing the lamentable effects of patchwork legislation.

Take, for example, the acts governing the county horticultural commissions and the state horticultural commission. These acts within themselves are well prepared, yet they fail in coordinating the inspecting and quarantining work. The local quarantining functions of the former have apparently nullified since our last meeting. Some of our best authorities believe that the original county commission law should have contained a comprehensive quarantine clause through which each commissioner could formulate rules subordinate to the clause and coordinate with other county rules under the uniform quarantine authority so delegated. As a matter of fact this law makes no provision whatever for the control of intercounty traffic in articles liable to infect the orchards of the state, although the county commissioner may do something in this line as quarantine guardian through the roundabout provisions of the state law. To obviate this defect the supervisors of almost every county began years ago to enact confusing and possibly unconstitutional ordinances which became the source of justifiable complaint by the nurserymen. These protective measures have possibly been nullified by an amendment of the state horticultural commission act in 1915, and I fear it will be impossible under the latter law as it now stands to substitute effective means of controlling intercounty traffic in articles likely to infect clean districts. In other words local quarantine has been abrogated and apparently no effective authority remains that restores the protection formerly afforded.

Uniformity of inspection is impossible under the later acts relating to horticulture and even the larger execution of these acts is vested in three or four different branches of the service, one of which was not intended to exercise an executive function. The state insecticide act is enforceable by the director of the agricultural experiment station at Berkeley. A fee is charged the individual for analyti-

cal tests, licenses, etc., and all moneys thus originating are payable to the university. The "standard apple act" is directed by the state commissioner, the inspection fees of the former being fixed by that official alone. In the apple law the expenses of inspection are fixed jointly by the commissioner, the board of control and a stamp duty, the proceeds of the latter forming a revolving fund in the hands of the state treasurer.

An act similar in purpose to the apple act is carried out by the county horticultural commissioner in which the expense of the inspection is a charge upon the taxpayers of the county. There is no reason why the apple growers should pay a stamp duty for inspection, while the growers of all other deciduous fruits and grapes and berries enjoy their inspection at the expense of their local community. Neither is there uniformity in limiting the wages of the peach inspector to \$3.50 per day while the apple inspector may be paid \$5. Inspectors under some of our old and new laws are dischargeable at the will of the appointing official; others only by fruit growers' petition; and still others are under civil service rules. Additional inspectors authorized by the standardization law can be employed only by petition on the part of 25 fruit growers. There are many other enactments which might be improved by removing conflicting or irregular methods of procedure.

But it is not my intention to go further into the inconsistencies of our statutes, for I have only a suggestion for better methods of improvements to propose. It is the duty of the fruit growers, this association and all others directly interested in horticulture to find some means of correcting the faults of these laws and to assist in unifying these acts by more comprehensive legislation. As a member of this organization I am interested in the attitude adopted by our legislators in the treatment of these questions, and from later developments in our economic affairs it appears to me these lawmakers intend to perpetuate and strengthen the office of county commissioner of horticulture. The call for a monthly salary instead of a per diem, for better fruit packing, for pure seed and clean plants, for better local quarantine is a call for increased executive authority in the county.

If the attitude of the legislature is a guide, public sentiment is being strengthened in favor of handling these questions through the county unit, the same as other and non-executive work is now conducted through the office of the county farm adviser. The latter office will find room for increasing activities without encroaching upon the executive functions of

the county commissioner and which cannot be legally assumed by the federal or university authorities.

Until the plan to consolidate the various agricultural offices of the state met with failure, I had thought some comprehensive scheme could be devised to unite the inspection and other executive duties of the county horticultural commission with those of the state commission, and so stated at the Los Angeles convention. I quote from the report of that convention as follows: "The (legislative) committee may contemplate the formation of a state department of agriculture for California, grouping such divisions as horticulture, dairying, forestry, etc., as subordinate bureaus under the secretary of agriculture, and only then should an attempt be made to modernize the county horticultural commission."

Since the failure of this plan I see no hope of an early unifying and strengthening of the county quarantine and inspection service or of any other relief through a cooperative movement such as this broader plan would have made possible. This being my conviction from the observations of the past year, that our legislators at this time are indifferent to a general reconstruction of the agricultural executive offices of this state, I have come to the conclusion that the horticultural offices must within themselves and under authority of the fruit growers devise ways and means of reform. However, I believe we should first adopt a uniform method of improvement and abandon all patchwork attempts to interchange and defit the elements that compose the body of our laws; discourage all new legislation that has not been adjusted to the old and made to take its place as necessary and coordinate part of the whole. I speak as only one small part of the force that must be depended upon to do this work, and for one I shall cease to advocate any change in our laws unless it is inspired by a general and well digested plan, supported and urged by fruit growers and their executive officials. By such comprehensive means only can we hope to give future horticultural legislation the force, unity and effect which many of us believe is deficient under the present laws.

But how can this plan of coordination and general effectiveness be brought about? We have seen the failure of past legislation to correlate our statutes and give united effect to our laws, however meritorious each of these laws may be in itself. What better plan of construction can be adopted?

What I now suggest is inspired by the desire to bring about this improvement in some practical way.

A temporary committee should be

selected by the state commissioner of horticulture, the personnel of which should include a member from each well defined interest of horticulture, such as cultural, commercial and official. It would be the duty of this committee to appoint a standing committee whose membership should represent every phase of the horticultural business entitled to a hearing, a majority of which should be bona-fide fruit growers.

Working under a well considered plan, this body of representative citizens should be authorized to take up the whole code of horticultural acts, determine broadly what changes should be made to harmonize the existing statutes, and to recommend for public discussion such new acts as are expedient and coordinate with those already in the collection. In other words, the committee would be empowered to take up every principle now contained in our laws, which have been tested in practice and approved by court decision—to take all this material and have it reconstructed into a concrete whole that would be free from the imperfections of the present laws. This committee should also recommend a broad plan for initiating future enactments that might be found necessary by new or changing conditions. This plan could be adopted, if satisfactory, as the standing policy of the horticultural interests of the state.

This legislative committee should be furnished with financial means for employing a jurist known to be versed in the systematic arrangement of acts embodying a common subject, and able to express the will of his clients in legal and certain phraseology, and should if possible understand the spirit and inspiration that have enabled the fruit growers to protect and conserve their own interests so well in the past by legislative pioneering that with all its faults is yet supreme in that line.

Every step this jurist would take would be under control of the committee and its work would be submitted at last to the fruit growers for approval and the legislators for enactment. I am sure the procedure here suggested would originate a manual for legislative consideration that would command respect and support. It would also clear up all the material defects and inconsistencies of the present statutes.

I commend for your earnest consideration whatever may be of value in these suggestions if any value is found. They are subject to more careful examination than I have given them at this time. Finally, if anyone can present a more workable plan of reconstruction I will cheerfully support it, believing as I do in the ability and determination of our horticultural interests to work out some means for a better code than we now have for the care and promotion of our chief industry.

The Alpha Automatic Power Spray Outfit (Patented)

Fitted with 2 In. or 2½ In. Automatic Duplex or Triplex Pump
Equipped with the New Mechanical

Automatic Pressure Governor

The Automatic Pressure Governor Insures Safety, Secures Uniform Pressure and Eliminates Unnecessary Wear. No Relief or Diaphragm Valve Required. Top Guard Rails Fold Up or Can Be Quickly Removed. Gear or Belt Driven. Brass Fitted Throughout.

THE TWO ESSENTIALS in a power sprayer are a thoroughly dependable engine of ample horsepower and a positive and reliable pressure regulator that will insure uniform pressure and eliminate unnecessary wear.

THE AVERAGE SPRAY is equipped with a cheap engine and a make-shift pressure relief valve or diaphragm which is exposed to the corrosive action of the spray material which soon puts it out of commission.

THE ALPHA AUTOMATIC PRESSURE GOVERNOR with which the Alpha Spray Outfit is equipped is a simple arrangement of a combined lever and spring on each plunger connecting rod which, when the pressure reaches a predetermined limit, automatically discontinues the operation of the pump without interrupting the driving power, again permitting it to resume operation when the pressure falls below the point at which it has been set.

THIS INSURES SAFETY, secures uniform pressure, and eliminates unnecessary wear (no liquid pumped except it passes through the nozzles), the pressure relief is not dependent on the operation of a sluggish or defective relief valve, but is positive and mechanical, thus making it impossible to run the pressure up to the danger point.

THE POWER PLANT depending on the size rig is either a 2½ H. P. or a 3½ H. P. Alpha Engine equipped with a "built-in", gear-driven, positively timed magneto, requiring no batteries or coil, and is easily started on the magneto without cranking.

CAN YOU AFFORD to own a spray outfit that will balk? When you get ready to spray you have no time to tinker with a defective engine, pump or relief valve, but want an outfit that is capable of a continued high pressure maintenance and one that is thoroughly dependable in every particular.

THE ALPHA AUTOMATIC SPRAY OUTFIT will meet your most exacting demands. The entire frame work is made of channel and angle iron, fitted with a wrought steel bed plate on which the engine and pump are mounted, direct connected with machine-cut steel gears.

BUILT IN ALL SIZES from a 2-inch pump and a 100-gallon tank to a 2½ by 3-inch pump and a 200-gallon tank. (Either duplex or triplex.)

IT WILL PAY YOU to investigate thoroughly the merits of the Alpha Combination Power Sprayer before buying. Send for catalog and prices.

Did you ever consider the importance of selecting your nursery trees for orchard planting? This, as well as BUD selection, careful growing and training, are the vital points to insure the future of your grove as a standard fruit producer and a paying investment. The more fibre roots you have on a tree the better it will transplant and the better it will grow and establish itself in the soil.

Write us the acreage you contemplate planting, the character of your soil and situation, and the varieties and number of trees to be planted and we will mail you gratis a copy of our book on "Citrus Culture", which describes the citrus industry from seed bed to bearing trees, harvesting, packing and marketing.

EXPORTS OF CEDRATS FROM GREECE A NEW MOVEMENT

By Vice Consul C. M. Corafa, Athens

PRESENT conditions have made Piraeus an important shipping center for cedrats which formerly reached consumers through various foreign ports.

The cedrat is a citrus fruit used by orthodox Hebrews at the celebration of the feast of tents, following atonement day, and plays an important part in the ceremonies. Owing to the increasing difficulty with which good specimens are procured, the closing of certain former sources of supply, and the high prices demanded, much attention has been given to the Grecian cedrat.

The tree itself is a variety of the *Citrus medica*, bearing a large fruit, not acid, and having a high and agreeable perfume. The tree is about the same size as the Mandarin orange. The greatest care is necessary for the proper development of the cedrat fruit from the time of blooming to the moment of picking, which takes place about the last of July. After the bud has appeared all surrounding thorns are removed from the branch, even the nearest leaves are removed, and the young fruit is wrapped loosely in flax lint, lest it be marred by a scratch or blemish. For religious purposes it is of the greatest importance that the fruit be perfectly smooth and without excrescence. The stamens are an important part in the sentimental value of the fruit and must be preserved intact. When mature the cedrat is packed carefully in individual compartments of a specially constructed box, each tiny compartment lined with flax lint, in which condition it is ready for the buyer.

Cedrat groves are located on slopes where the winter winds are cut off by protecting peaks and where the temperature does not go too low, for the slightest frost withers the stamens, rendering the fruit no longer suitable for religious purposes, and its value drops to the common quotation ranging between three and five cents apiece, while the perfect fruit retails for from 60 cents to two dollars each.

The use of the cedrat in religious celebrations dates, according to tradition, from a period near the Babylonian captivity, and its use is zealously adhered to by orthodox Hebrews in various parts of the world. Each member of the congregation is supposed to possess on the ceremonial day at least one perfect specimen of the fruit without fleck or blemish and retaining the stamen.

Until the outbreak of the present war Trieste was the greatest cedrat market of this section of the world, but the closing of that port has shifted the market center to Piraeus whence a large export is developing from the increased production which has taken place in the cedrat groves in the districts of Parga and Chimera in northern Epirus, on account of the blockade of the Syrian coast, whence a large amount of the crop was formerly sent to Trieste.

Competent ecclesiastical authorities pronounce the Chimera cedrats

grown in New Greece to be the best in the world for religious purposes, the excellence of which variety is said to be due to a secret process of cultivation which is jealously guarded by its fortunate possessors.

Two shipments of cedrats were made from this district recently, totaling 3,793.99 pounds valued at \$2,480.10, indicating the very high prices brought by this fruit.

* * *

American Trade in Cedrats

The report from the American consulate at Athens on the trade in cedrats in the Levant suggests a new industry for the United States. Quantities of these cedrats are imported. They might be grown in Florida and California. The domestic market would probably not be extensive as the use of cedrats is now confined to one religious denomination, but the industry would be worth while. The chief difficulty is cultural, for the fruit requires most minute attention and must ripen in midsummer (off-season) in time for ceremonial use. However, as the fruit is especially fine for preserving, those ripening at other times could be conserved.

The bureau of foreign and domestic commerce has made an investigation of the cedrat trade in the United States, the following report being from the New York office:

"The question of the importation of cedrats into the United States was taken up with a number of the more prominent Hebrew merchants in New York and persons who were in a position to give the desired information.

"As a result of the interviews with these people, it was ascertained that they agreed that it would be well worth while for American planters to attempt to grow cedrats in the United States. About 50 years ago such an attempt was made to grow cedrats in the United States. The domestic demand for the fruit was very small and most of the fruit was exported to Germany.

"Under normal conditions a cedrat set retails at one dollar and a half to two dollars each. On account of the war there has been a scarcity, and the sets have sold as high as seven or eight dollars. The men interviewed pointed out that if cedrats could be retailed at approximately 50 cents the demand would be enormous, the Hebrew Publishing Company establishing its estimate as high as 200,000.

"There is a small quantity of cedrats grown in California, but they are not nearly as good as those coming from Greece and do not command as high a price.

"Cedrats have been imported from Palestine and from Greece. Those coming from Greece are said to be better than those from Palestine. It takes a number of years before the plant yields a very high class fruit, and this is a comparatively new industry with Palestine.

"It was impossible to ascertain the exact figures as to the amount of cedrats imported which remain in New York. Approximately 65 per cent remains in New York and the balance is sent into other cities of the United States."—Commercial Reports.

INFORMATION WANTED ABOUT THE FEIJOA

I would like to open up a discussion in your columns regarding the feijoa. Will the growers write their opinion of the fruit, their success, etc.

My observation shows in the San Joaquin Valley that fruit cannot be expected before the fourth season from the nursery. The plants bloom profusely but do not necessarily set fruit, even if near others or if water is withheld. Nor do they set better if watered.

In the F. D. Nagle planting at Sultana the size of the fruit varies greatly (of course they are seedlings) but no more than the yield. He gives them the best of care, is observing, and has kept a tree record of his orchard. Also he is successfully grafting over his low producers and poor types.

This is a splendid fruit of delicate flavor when only the pulp is eaten. I well remember, several years ago, being given the fruit with no instructions about eating. I ate out of hand and the taste of the skin destroyed the good qualities of the pulp.

As I see it this fruit cannot become very popular unless large fruiting and regular bearing types are propagated. Steps certainly should be taken to give these to the planters together with best information as to methods used by those whose trees set a good crop. Incidentally let's go a little slower on the production of seedling and unproven stock to sell at novelty prices.

Will other growers contribute their experiences, particularly the successful men?—Walter C. Ficklin, Kerman.

HYDROCYANIC ACID GAS FOR FUMIGATION

The agricultural experiment station of California has issued Circular 139, "The Generation of Hydrocyanic Acid Gas for Fumigation by Portable Machines." It is by Mr. H. D. Young. Illustrations are given of the Owl fumigating machine and the Cyanofumer, with descriptions of each; also tables for charges. Mr. Young writes regarding one or two errors in this circular which he describes as follows:

There has just appeared Circular No. 139 from the University of California, dealing with fumigating machines. The investigations with the portable machines were made before any of these machines were put into actual commercial fumigation operations. Subsequent experience gained from running the machines under regular working conditions has indicated the advisability of a few changes to which attention should be called.

Since the investigations were made upon which Circular No. 139 was printed a slight change in the strength of the cyanide solution has made it necessary to alter the graduation of the pump cylinder so that when the indicator is set at 10, 25 ounces of solution are delivered instead of 24 ounces, containing 10 ounces of solid sodium cyanide. The machine when fully charged contains 1650 ounces of sodium cyanide solution, equivalent to 660 ounces of solid cyanide. To neutralize this amount and to provide sufficient excess of sulphuric acid to complete the chemical reaction and the delivery of hydrocyanic acid gas, 495 ounces of concentrated sulphuric acid are placed in the lower chamber together with 495 fluid ounces of water. It has been found unneces-

sary to use the large excess of acid which was recommended in Circular No. 139, as equally satisfactory results have been obtained with the smaller amount above mentioned.

In some places, notably in Tulare County, some trouble was experienced with a deposit which accumulated in the gas outlet pipe. This occasioned some alarm at first but analysis has shown it to consist almost completely (above 95 per cent) of sodium sulphate. This sodium sulphate is the resultant chemical produced from the reaction of sodium cyanide and sulphuric acid, which under temperature conditions prevailing in Tulare County during the summer months had a tendency to crystallize itself out of solution. This crystallization, should it occur, can in no way cause any loss of gas unless it is allowed to obstruct the outlet pipe sufficiently to increase the pressure within the machine.

The suggested method to prevent the obstructing of the outlet pipe is to fill the discharge hose with water, then raise end to the same level as the outlet pipe within the machine, and allow it to stand during the day. This dissolves out the sodium sulphate and cleans the standpipe completely.

An agent of the department of agriculture has been investigating conditions in Humboldt County, especially as to the appointment for that county of a trained woman worker to take an interest in home economics.

SICILIAN LEMON CROP

By Consul Samuel H. Shang, Palermo

There are two crops of lemons yearly gathered in Sicily, the winter and summer crop, the latter known as "verdelli." The winter crop, gathered from December to May, was a medium one this year and the quality was good. The verdelli crop was also good and above normal in quantity.

Lemons shipped to the United States from January 1 to October 1, 1914, totaled 2,086,004 boxes (300 lemons to the box), while up to October 1, 1915, the amount was only 1,387,547 boxes.

Production has constantly been greater than consumption, and consequently prices have not kept up. Prices in September ranged from nine to 12 lire (at the depreciated rate prevailing about \$1.50 to \$2) per thousand, while in September, 1914, the price was \$3 to \$3.50.

The good weather which prevailed during the late summer and early autumn makes the prospects for the next lemon crop good both as to quality and quantity.

Deciduous

Fruits

THE CHERRY IN CALIFORNIA

Written for California Cultivator
By Leonard Coates

HERE is a renewed interest in cherry growing in California, owing to the generally good prices obtained and the universal appreciation of the quality of this most popular fruit. And it is, perhaps, literally the most popular of all fruits during its short season, but in California the season for even the cherry is lengthened to fully two months by reason of our wide topographical and climatic variation. For instance, while from Vaca Valley and some parts of the Sierra Nevada foothills we get ripe cherries early in April, the same varieties in Alameda or Santa Cruz Counties would not be ripe before the middle of May, and in Napa or Sonoma Counties between these two dates, and this fruit may be found in the market until July.

The area for the profitable commercial cultivation of the cherry is rather limited, being confined mainly to the valleys in the Coast Range either immediately north or south of the Bay of San Francisco, some portions of the Sacramento Valley, and the eastern foothill country. This implied area is extensive enough, but soil and moisture conditions must also be suitable.

For the best results a deep, sandy loam is required, such as is found along the river and creek bottoms where the largest trees are always to be found. It is an open question, however, whether it is desirable to have the largest trees, the expense of harvesting the crop being increased in proportion. What is essential to cherry culture is applicable to all fruits, though in a less degree, and that is perfect drainage, and the deeper the soil under such a condition so much the larger will the tree grow. Unless the requirements of soil and moisture are present, the cherry tree will fail absolutely while other fruits are not so arbitrary in their needs.

Stocks for the Cherry

What is known as the Mazzard, a cherry growing wild in the Eastern states, is most generally used, not only in California but throughout the United States, as a stock for the sweet or Bigarreau cherries. There are one or two species of wild cherries in Europe which are similar in habit and which are no doubt imported and used very considerably under the name of Mazzard. Another species, a native of Europe, known as Mahaleb, is quite distinct in appearance and in habit of growth, having small, shiny and roundish leaves, the growth of the tree being much more spreading; the wood also is harder. This stock, being of slower habit, will dwarf the trees to some extent. Undoubtedly it is hardier, and more capable of enduring extremes of moisture or aridity and therefore is recommended where the soil and moisture conditions are not congenial for the Mazzard. For this reason again, and because trees on Mahaleb root come into bearing sooner, it is

generally the better stock for cherries for the home orchard or town lot.

Cultivation and Diseases

The cherry tree in California is usually, and preferably, planted at one year old from the bud or graft. Planting directions for any tree are often given, and nearly as often unheeded, but careful attention thereto is none the less imperative. The hole should not be less than two and a half feet deep and the same width. If the subsoil is heavy it is better to blast in the fall while the ground is still dry. If this is done no digging will be necessary, but any "pot-hole" that may be formed must be filled and earth well tamped in. Spread the roots well and firm in the soil very thoroughly. If soil is sandy no harm will result if trees are set a little deeper than they stood in the nursery; neither will it do any good. If soil is heavy and trees are planted too deep they will be stunted, perhaps permanently; in this case a percentage also will fail to grow, and yet there are growers who persist in setting their trees several inches too deep. Perhaps they are right and the tree in error not knowing where to place its roots or its stem.

It is better to leave at least two feet of stem above ground after first pruning and the next year select three shoots, five or six inches apart if possible as a foundation for the future tree and cut them back one half. By so doing there will be less liability to gumming in the crotches. The year after these main limbs will have branched into two or three more to each one. Thin these out and leave six or seven, so divided that the center of the tree is open or goblet-shaped. These may again be cut back, leaving three or four feet of growth to each. Afterwards, merely thin out where growth is too dense and keep laterals well cut back, which will then soon develop fruit spurs.

It is very difficult to prevent buds on a young cherry tree from being broken out. For that reason alone it is always advisable to leave two feet or even three feet after planting. If many of the buds are broken so that there will not be leaves on the main stem to shade it, it will be necessary to use some other method of shading, strips of burlap, loosely wrapped around being the best. The bark of a newly planted cherry tree is very susceptible to changes of temperature, being burned by the rays of the hot sun or affected similarly when the weather turns suddenly cold and frosty in the spring. Apparently, the flow of sap is checked and "gumming" ensues. This gum should be cut out at once or it will increase the affected area. These conditions are worse where soil or atmosphere are not suitable.

What is known as the pear slug, a small, slimy worm which hatches and feeds on the upper surface of pear, cherry and plum leaves, sometimes becomes a serious pest. It is easily controlled by dusting the leaves with a fine, gritty dust, which adheres to the worm or by an arsenate of lead spray which poisons the leaves on which it

TREES

All Varieties

In our large nurseries located in the choicest spots of California, we grow the best. This is the only nursery that can supply your wants complete.

As this will be a busy planting season we suggest that you send us your orders immediately so as to avoid any possible disappointment in not being able to get the kinds and quantities that you desire if ordered later in the season.

Olive Trees

For years we have been specializing on the growing of olive trees, our stock this season being the finest that we have ever grown.

We can supply you with almost any quantity of

Manzanillo, Mission and other varieties.

Get our prices and suggestions before placing your order. Our olive trees are strong and thrifty and guaranteed true to name.

CITRUS Trees

This promises to be a big planting year for citrus stock of all kinds and we are prepared to supply the demand. Ask us for quotations on Washington Navel and Valencia Late Oranges; Lisbon and Eureka Lemons; Marsh Seedless Pomelos—and any other varieties that you may have in mind to plant.

We have a good stock of the latest budded varieties of Avocados and all prospective citrus planters will do well to get our suggestions as to the varieties that will be the most profitable when the trees come into bearing.

GEO. C. ROEDING, PRES. AND MGR.
Box 12, Fresno, California

feeds. Gophers are very troublesome in the cherry orchard and must be fought incessantly by means of traps or poisoned bait, or by smoking or the use of carbon bisulphide.

The cherry delights in a uniform degree of moisture during the growing season in both soil and atmosphere, but abhors the dry heat of the interior, although in the river bottoms of the Sacramento Valley it occasionally flourishes. In Southern California the cherry is not a success, the climate being too uniformly warm and dry.

Species and Varieties

The Mazzard cherry has its origin in *Prunus avium*, or bird cherry, a species native to Northwestern Europe. There it often grows to a height of 50 to 60 feet when sheltered by other trees and makes a valuable timber. It is in fact distinguished from other species by its upright habit and large leaves. Cultivated types have been arranged into four groups:

The Mazzards, which yield in some cases fruit which is used for preserves and for flavoring in certain liquors.

The Heart cherries, of which Black Tartarian and Rôckfort are examples, being more or less heart-shaped and soft in texture.

The Bigarreux, heart-shaped, but of firm, solid flesh, like Royal Ann and Bing.

The Dukes, of which May Duke is a familiar example, soft-flesh and slightly acid.

Prunus cerasus is another species, of more spreading and dwarf habit, its cultivated forms being:

Amarells, light-colored sour cherries, such as Early Richmond.

Morellos, dark-colored sour cherries. Seedlings of these are used for stocks for the sweet cherries, giving them a dwarfer habit, but *Prunus mahaleb*, another European species, is more generally used.

The Dukes and Morellos are not cultivated commercially in California as they do not ship well, but a few trees should be found in every home orchard.

The principal commercial varieties of cherry grown in California are Black Tartarian, Royal Ann (or Napoleon Bigarreux), Bing, Chapman, in largest quantities, but very many others of domestic and European origin are grown also.

Marketing

The cherry is the most popular fruit of the retail stores because of its season, when the appetite universally craves fresh fruit, and which, in the cherry is found in its most luscious form. Therefore the local markets dispose of very large quantities, the canners use the bulk of the crop of Royal Anns and the markets in other states as far east as the Atlantic Coast consume many hundreds of carloads of the firm-fleshed, dark-colored varieties mainly, but also a large quantity of Tartarians.

The earlier sorts, while prices rule very high, are shipped quite extensively by express in pony refrigerators, but later they go through in carload lots, all packed in five-pound crates.

Picking and packing the cherry both require expert labor, and no one should attempt either on a large scale until he has worked with experienced hands.

The crying need with the cherry, as with other fruits, is better distribution as well as standardization in the pack. The markets in the East for the cherry are more capable of development and expansion, perhaps, than with any

other fruit. Packed in even two-pound crates or drawers or baskets they would carry better and the largest, finest fruit sells high enough to warrant even this added expense. The outlook for the cherry is bright but it needs more advertising and better distribution.

WHY PLANT BLIGHT RESISTANT PEAR STOCK

Written for California Cultivator
By Claud D. Tribble

FEW years ago pear blight wrought such havoc among the pear growers that 95 per cent of the pear trees in the Sacramento Valley pear districts were destroyed and dug out. Mr. E. A. Gammon of Courtland sought the assistance of the United States department of agriculture and on his place was first demonstrated a partial control of blight by cutting out the affected parts, burning the cuttings and disinfecting the wounds on the trees and also the tools used in cutting out the blight. As a re-

sult Mr. Gammon had a \$40,000 Bartlett pear crop when his neighbors had lost all their trees. The French pear and quince stocks were all that were used at the time and both were very susceptible to blight on branch and root suckers. The French pear throws suckers all through the orchards and although the man looking for blight tries to cut these off as soon as they appear they come up in a clump of weeds unnoticed, are infected by blight which follows the whole root system till the tree is destroyed, and no evidence may be seen till the tree begins to wither and die. It has been demonstrated that the quince is more susceptible to blight than any other root.

In 1912 we sent out letters to a number of the leading pear growers asking their opinion as to the advisability of growing Le Conte and Keiffer cuttings for resistant stocks and also advised that the stocks could not be grown as cheaply as the French pear, and received encouraging replies from every grower to whom we wrote. In replying to our letter Mr. Gammon called our attention to Prof. F. C. Reimer's statement in reference to the *Pyrus sinensis* stock as being "practically blight proof and absolutely sucker proof."

We wrote Prof. Reimer at Talent, Oregon, and we quote the following extracts from his courteous reply: "Under our conditions we can not grow the French pear stock because of its liability to blight. We recommend the *Pyrus sinensis* (Japanese) stock because of its greater freedom from blight and its non-suckering. This stock has given just as good results in growth and productiveness and I understand that where it has been used a great deal longer it has given satisfactory results. This stock is so much freer from blight than the French that there is no comparison."

In our own experiments we grafted some of this stock on some dwarfed pears to note the growth, and in two seasons these trees were as large as the trees that were five years old worked on the French stock.

In conclusion, this stock keeps the blight from entering the ground by suckers and gives the grower the opportunity of fighting the disease above the bud or union. We have perfect success in budding this stock, the growth in the nursery side by side with French stock is larger and more uniform. It is claimed that it is not badly infested by the aphid or root louse but we can not verify this. It will thrive on dry soils where the French stock will not.

Give Yourself \$60.00 and a "BULL" TRACTOR For Christmas

On January 1st, 1916, the price of the "Big Bull" goes up to \$645—it is \$585 now, you know.

The price has always been ridiculously low. We never could understand how the factory could turn out such a machine at anything like the price.

Can't get raw material—and the prices on raw material away up. Result, a slight advance in price. Still the "Bull" costs less, quality considered, than any tractor on the market.

Our Mr. Brown has just returned from the factory at Minneapolis. We are passing the tip he got along to you quick. If you get your order in right now so it reaches us before December 31st and pin \$85.00 to it as a deposit, we can ship your "Bull" as late as February 15th with bill of lading attached for the balance.

Not an order received later than December 31st can be filled at present price.

Can you think of an easier way to make \$60.00? But you will have to act quick.

LIFE HISTORY OF GLADIOLUS

N original gladiolus bulb is just as truly born as any of our domestic animals and the process is very similar. This knowledge, which has only been revealed in recent years, is enabling plant breeders to succeed in their work.

When the pollen from one variety comes in contact with the stigma of another it sends a tiny rootlet down through the pistil until it reaches the embryo seed. In this way two individualities are united and a new life is generated.

This new life or new variety embraces most of the general characteristics of the two parents in color, form, vigor and countless other characters that make each variety different from any other. Some characters may become more prominent, some may disappear and reappear after several generations. Some may be dropped entirely, and some new characteristics may be developed by the environments of the parents.

Most varieties of gladioli require about three years' growth from the bulb before they reach maturity. For this reason two-year-old bulbs are most valuable. Bulblets usually produce small bulbs that seldom bloom the first season. These bulbs nearly all bloom and produce a large number of bulblets the second year, but the blooms are not so large or numerous as they will be the following season when they are usually at their best, or, we might say, in their prime of life. Some varieties will continue vigorous for only two or three years after maturity, and others for a longer length of time. Much also depends on the environment and the treatment that the bulb receives from the grower, so that no exact age can be set at which a bulb becomes worthless.

We have certain lots of bulbs that we have been planting in our test plots for about ten years, each spring planting the bulbs that grew on top of the old bulbs the previous season. Some that were old decrepit bulbs when we got them are all dead and gone. One lot has never produced a bulblet that we have seen, and but few flower spikes during the last six years, but it has increased from a dozen bulbs to about a hundred. What are they worth when they will not produce flowers? When a gladiolus bulb dies, it usually fails to sprout and rots in the ground, but we sometimes find bulbs at digging time still sound that did not have vigor enough to sprout. As an experiment we have planted some of these the following season and they invariably rotted in the ground.

Some think they have ample proof that gladioli will change color because they miss some varieties after growing them a few years. The fact is that some of the varieties lacking vigor die and rot in the ground while the more vigorous ones will increase by division so that the dead ones are not missed.

A bulb five or six years old will produce but few bulblets. As an illustration, I quote from one of my previous writings on this subject: "A gladiolus bulb will reproduce itself and

bulblets freely for a few years but the production of bulblets and the vigor of the old bulb will gradually diminish as does the production of eggs by the old hen. The bulb may bloom and the old hen may show her gaudy feathers for a few years longer but they are both nearing the end of the journey from which no traveler returns."—G. D. Black in Modern Gladiolus Grower.

PREVENTING DEATH OF CLEMATIS PLANTS

The sudden dying of clematis plants, especially wherever the large-flowered kinds are grown extensively in America and Europe, has been noted for many years.

The disease shows itself differently on various species, says W. O. Gloyer of the New York agricultural experiment station. On hybrids grown in the field it is a stem-rot, while at the greenhouse where cuttings are propagated it is a leaf-spot as well as a stem-rot. On the clematis paniculata the disease takes both forms.

The following methods for controlling this fungus are recommended:

There is less disease when the hybrids are supported while growing than when they are permitted to trail on the ground. In the case of the clematis paniculata, however, the selling price of this variety does not warrant incurring the expense of supports. The author in this case advises transplanting the plants from the beds to the open field after the first year and placing them far enough apart to prevent matting, which is always a condition favorable to the disease. The following spray applied lightly controls the disease on clematis paniculata growing in the beds and on cuttings in the greenhouse: One pound of laundry soap and six pounds of sulphur to 15 gallons of water. The disease can be controlled on the hybrids in the forcing frames or in the greenhouse by the use of sprays. In all cases it is best to remove the diseased leaves and dead vines before spraying. It is particularly important to clear out such leaves and vines, especially if the plant is wintering outdoors, as the fungus is able to survive cold weather. This indicates also that the same beds should not be used for clematis during successive years.

The retail purchaser of clematis can prevent the dying of plants by taking simple precautions. The plants should be placed in good soil, well drained and on a sunny exposure. As soon as the new shoots have formed the old vine tissue should be carefully cut away close to the new shoots, removing all traces of the brown, discolored wood in which the fungus is to be found. Proper ventilation is obtained by training the plants to a strong trellis.

County and state fairs are fast getting away from the idea that large-sized vegetables or fruits should be awarded prizes. Quality, evenness, appearance and use are the factors that should influence premium awards.

Zinnias are coming more and more into use. The improved sorts are excellent in beds, and many of them make good bouquet material.

By C. A. Briggs

A Long Step Forward

Eight years ago J. W. Benoit, a young farmer of Modesto, started to build up a registered Holstein herd. He had five old cows and \$750 in money. Was that all his capital? No! he had youth, courage and a knowledge of what constituted a good dairy animal. Besides this he was a worker. Today on his farm of 40 acres he has 47 head of all ages of which 43 are milking—all of the fin-

Elmer Lamb of Ceres reports recent sales from his Rancho Rubins herd of Duroc-Jersey swine as follows: Boar and bred gilt to F. A. Haroux, Applegate; boar to J. L. Dickenson, Visalia; boar to W. T. Sesnon Bradley; gilt to N. S. Boone, Haywards; gilt to J. M. Henderson, Sacramento; boar and four gilts to John B. R. Cooper, Monterey.

R. E. Watson, Rancho Dos Rios, Modesto, has recently sold to D. O. Schuman of La Vega Ranch, Artesia, a registered Jersey bull and two registered heifers for foundation stock.

Elect E., Property of J. W. Benoit, Modesto.

est type, blood and breeding, registered Holsteins. His herd sire, El Prado Colantha, is a splendid individual whose dam, Edith Mandell Wayne, has a seven-day record of 30.9 pounds of butter and 484.7 pounds of milk. His sire, Colantha Sir Pontiac, has proven his worth as transmitter through the records of many daughters. The well filled barns and great stacks of alfalfa and the sleek black and white cows all show success and point to a greater success. It has

POTATOES AS HOG FEED

Because of the surplus of white or Irish potatoes now on the market and the consequent low prices, many farmers have been seeking information as to the possibility of feeding them to hogs.

Many experiments have been conducted in Germany and other foreign countries as well as a few in the United States to determine the value of potatoes as feed for swine. In Ireland and Germany farmers feed large

vantage when cooked or steamed and mixed with other feeds. Experiments in which raw potatoes were fed alone have been reported. In certain instances the raw potatoes are said to have caused scours. However, raw potatoes in small quantities and in a diet lacking succulence may be conducive to health in pigs.

In cooking potatoes only enough water should be used to make a mealy mash and prevent burning. The resultant meal should then be mixed with corn meal or other grain supplement. Tankage, skim milk, or meat meal would probably add to the profit

of the mixture. Potatoes when prepared in the manner described and under the conditions mentioned can often be fed to pigs with advantage.

The silo makes it possible to raise more feed and to keep more cows on the same acreage and substitutes certainty for uncertainty in the management of the herd to an extent impossible in any other way.

The silo should be smooth on the inside and perpendicular from top to bottom. Uneven walls prevent the silage from settling evenly, all air is not excluded and spoiled silage is certain.

THE STANDARD SOIL TESTER

AT YOUR SERVICE

It Will Show You Accurately:

1. Whether a soil is in the right chemical and physical condition.
2. Whether a soil is slightly, moderately or extremely acid.
3. How much Lime is needed per acre to counteract the acidity.
4. What quantity of Carbonates (Lime and Magnesia) a soil contains. It will indicate quantities, both in "percentage", and "in tons per plowed acre." From this you will see whether
5. Whether disclosure of Carbonates is Alkali or Lime.
6. Whether a soil is lacking in Humus. It will show you whether a soil contains 1 per cent or more, 1/2 per cent, or none.
7. Whether a soil is in need of a green manure crop.
8. It will demonstrate the probability as to whether a soil will respond to applications of chemical fertilizers or not.

been said that any success is but the shadow of the man that created it, and surely this farm and herd speak in no uncertain tones of the determined effort of its owner. Another lesson to be gained from what he has done is the results that are possible for other young men in the same line of work. The dairy industry of California has room for many such.

Recent Sales

J. K. Fraser of Denair, breeder of Duroc-Jersey swine and Holstein cattle, reports sales as follows: to Dr. Dixon, Hanford, bred sow; to Mrs. J. W. Bihne, Phoenix, Arizona, Holstein heifer.

quantities of potatoes annually. From experimental data it has been concluded that four to four and one-half bushels of potatoes when cooked are equal to about one bushel of corn for putting gains on hogs. Therefore, if corn is worth 80 cents a bushel, potatoes when fed to hogs would be worth only 18 to 20 cents a bushel. There may, however, be instances where it would be more advantageous for the farmer to feed to hogs right on his own place at least part of his crop rather than to haul these potatoes to an already overloaded market.

According to the consensus of opinion potatoes are fed to the best ad-

ABOUT HARD SPOTS

Written for California Cultivator
By Sacramento Valley Contributor

HERE is a story of an incident in California development that will be of interest:

In many districts in the state the soil is heavy; that is, it is made up of a comparatively large percent of silt and clay. It is difficult to plow when too dry and it "runs together" and forms big, hard lumps when too wet. In order to secure the mellow, easily worked seed bed that is consistent with good farming it is necessary to plow and disk and harrow when the soil contains just the right moisture content, not too wet nor too dry.

It is believed that these heavy soils have been formed by the washing down of the hills into the valleys, the heavier particles have settled first, these fine grains of silt and clay being held longer in suspension and making up the soils at the lower levels. Because they are made of these fine silt and clay particles they are the richest and most enduring and when properly handled the most productive of all soils.

But when they are developed under some intensive cultivation system it is frequently found that there are hard spots that do not grow as satisfactory crops at first as the balance of the field. These may have been formed in low pools where the water stood longer and the very finest particles settled during the period when the land was in the process of formation.

In one district in the great interior valley a man bought a piece of irrigated land, made good ditches on it, leveled it carefully, made a good seed bed, sowed alfalfa and secured a good stand.

He clipped it two or three times as it became high enough to strengthen the root growth, then let it come on to make the first crop.

He was very much disappointed to find that there were certain spots where the alfalfa did not grow so well as on the rest of the field, and on investigation he found them harder and the soil containing less moisture than in the places where the better alfalfa was growing. He hoped that this condition would disappear after the next irrigation but was more than ever disappointed when he found the condition even worse. The alfalfa on the spots was even shorter, in comparison with that on the rest of the field, than before.

Very thoroughly worried now and convinced that he had bought a poor piece of land he took a shovel and started to find out anything he could about the conditions in the spots, fearing that there might be a bed of alkali close to the surface.

He found that the soil was very hard, and six inches below the surface, very dry. The irrigation water had passed over the soil but had not penetrated deeply, as it did in the remainder of the field.

During the rest of the first year the crop on the hard spots amounted to practically nothing. The roots were

forced to feed in the few inches into which the moisture penetrated at each irrigation, and this meager root growth made possible a very limited development of that part of the plant above the ground.

The next season there was a somewhat better growth on the spots, the first crop, less the second, and almost none after that except on a couple where he had put some lime and manure as an experiment. These held the moisture, permitting greater root penetration and consequently more top development.

Without the mulch made by the manure and the mellowing effect of the lime the untreated spots dried out, and after the moisture left by the winter rains (which had penetrated deeply) was dried out, it was not possible by passing the water over the land as in ordinary irrigation, to get it into the soil again. And letting it stand on the soil would not accomplish it either. If the spots had been cultivated up—deep furrows run close together through them—and a small stream allowed to trickle through for several days, it could have been done, but with the flooding system as the land was prepared for irrigation this was not possible.

Incidentally it was also found that by irrigating the alfalfa twice to each cutting—and not allowing any of the soil to become too dry between irrigations—better results were secured.

Now all of the hard spots are to be covered with manure and lime is to be applied to them at the rate of two tons per acre. In two more years it is expected that they will all have disappeared, as the treated spots now have.

Everywhere that farming is done there are problems—they are no more difficult here than anywhere else.

MANUAL OF SOIL PHYSICS

A "Manual of Soil Physics" by Percy B. Parker, M.A., Professor of Agronomy of the University of Nebraska, published by Ginn & Company, Boston, at 65 cents.

The growing need for a complete set of exercises for laboratory work in soils, suitable for institutions that have introduced agriculture into the curriculum, has been very noticeable. The "Manual of Soil Physics" has been prepared to meet this growing demand and to enable instructors to offer a more thorough study of the soil. The subject matter of the exercises has been confined almost entirely to soil physics, but a few exercises are included to emphasize other important subjects of soil study. The exercises give the student an understanding of the origin of the soil; soil water, its movements, use, and conservation; soil heat; the texture and structure of the soil; organic matter, its effect upon the physical condition of the soil and its influence upon productivity. The study includes exercises that instruct in some of the more simple and practical methods of soil examination.

The covers indicate a good sized book, and the best part of it is it is to be made by the student. There are only about 100 pages of instruction, or rather suggestions of work to be done, with some questions. Practical experimentation, with records of same, makes up the balance of the book. Leaves are added or removed as needed.

Blast Holes Now For Thriftier Trees

BLAST the holes and blast them now for trees you intend to plant next Spring. Leave the subsoil exposed to the air, frost and moisture all winter. The weathering will settle and mellow the earth, and the compact subsoil will be disintegrated.

You can easily, quickly and inexpensively do this work with

HERCULES DYNAMITE

Trees planted in Hercules blasted holes have longer and stronger roots than those planted in spade-dug holes. Their development is more vigorous and rapid and they bear earlier. The reason for this is that Hercules Dynamite loosens the soil for several yards around and below the hole and as a result the roots have more open material through which to expand.

Progressive farmers and orchardists are using Hercules Dynamite not only in tree-planting, but also in orchard rejuvenation, sub-soiling, rock and stump blasting, draining, ditching, excavating, etc. These and other time-saving, labor-saving and money-saving uses are clearly explained in our

Interesting Free Book

Every farmer and orchardist should read *Progressive Cultivation*. To every reader of this magazine we offer a copy of this valuable book without cost or obligation. Write for your copy today.

HERCULES POWDER CO.

STATE COMMISSION MARKET

By William E. Brown

THIS is a brief outline of some impressions in relation to the state commission market. My conclusions are largely based upon testimony given at the hearings conducted by the rural credits commission and upon first-hand information given me by several market experts now actively engaged in handling California products.

My idea of making a start with the state commission market is embodied in the following recommendations:

As a working premise it must always be borne in mind that the Brown-McPherson state market act is a California law, designed primarily to accomplish the greatest good to the greatest number in the state of California.

Operations should begin at the point of greatest necessity. To illustrate: There are said to be about 15,000 growers of citrus fruits in the state, while of the smaller farmers producing varied crops there are approximately 100,000. It is further estimated that this class is feeding about 2,000,000 consumers. The first named class, the citrus growers generally, have means and have their own sales organization, while the latter class is unorganized and in many instances individuals facing financial disaster through archaic market conditions, while the consumers they are feeding are paying too much for living, due to the same market inadequacy. Manifestly then if we are to bring the greatest good to the greatest number of our people, here is the point to begin, i.e., to shorten the avenue between the 100,000 small farmers and the 2,000,000 consumers to the end that the former may receive a just recompense for their labor and that the latter may pay a reasonable rate for cost of living. The larger industries, such as the citrus, nut, raisin, etc., have their lines fairly well laid, and as a whole are not asking for aid. Furthermore, the number of individuals engaged in these activities is relatively small compared with the many thousands of smaller farmers. The purpose of the state market act is that of all beneficent laws, namely, to benefit individuals first, and if this is intelligently accomplished, genuinely successful industries will be established.

It will be well to bear in mind that in the beginning the volume of business done is not a vital matter. The mere fact that the market director is on the map, so to speak, with a workable plan, establishing standards of quality and price, will begin at once to improve the entire situation, just exactly as the state going into the insurance business regulated and modified insurance rates.

In order to accomplish the much desired results briefly outlined in the preceding paragraphs, the following tentative outline of a plan is offered for consideration:

Establish an experimental production and consumption zone, say, in the city of Los Angeles, whose immediate surrounding farming country raises practically everything necessary to sustain life and whose good roads and transportation lines radiate

in every direction. Rent a warehouse for a central receiving and distributing point.

Establish rules and regulations as to standardization, quality, packing, shipping, etc., and invite all producers within the zone who are willing to comply with said regulations to consign their products to the state commission market.

Encourage the producers in the various localities to form cooperative organizations for the purpose of assembling produce and packing and shipping it in compliance with the regulations issued by the market director.

When the market director is assured of proper quantities of varied products, opportunity should be extended to the various retail dealers throughout the city to use their stores as avenues to the consumers, with the express understanding that they be permitted to make a fair rate of profit (say 25 per cent) and no more. In the event of their not complying with this arrangement, then the privilege of buying "State Label" goods is abrogated, and the loss of a privilege it will be, for the "State Label" will speedily become a synonym of best quality, honest pack, right priced goods.

To safeguard the consumer and prevent the retailer from asking exorbitant prices that will restrict output, adopt the method pursued by the Raisin Growers' Association, i.e., keep the consumer posted as to the approximate price he should pay the retailer. This might be accomplished by a bulletin in the daily papers, just as market quotations are now published.

The following incident well illustrates the evils which the Brown-McPherson state market act is designed to correct: A farmer in one of the northern towns of the state brought some lemons to market, for which a retailer paid him eight and a quarter cents per dozen. The dealer put a price upon the fruit of 45 cents per dozen and then wondered why they didn't move. It will be noted that the dealer boosted the price more than 500 per cent.

The reason that cooperative selling organizations are powerless to meet the situation is that their influence does not extend far enough. While in a measure they protect the producer from exploitation by the jobber, they do not control the situation between the jobber, retailer and consumer. Only the state can do this. Statistics show that in some instances the price between the jobber and consumer is advanced as high as 400 per cent. This multiplies the consumer, immensely restricts outlet and causes consequent rotting in the fields and orchards of thousands of tons of fruits and vegetables. In other words, cooperative selling organizations are primarily concerned only with the producer's welfare, while the state commission market is in position to benefit all of the people, consumers as well as producers.

Boiled down, the situation resolves itself into a very simple economic question. Here is the producer and there is the consumer. Now establish the most direct avenues between the two classes, eliminating as far as possible all duplication of effort and expense. Under our present outgrown and wasteful method of marketing the products of the soil, the farmer gets only about 27 cents or the consumer's dollar and the balance of 73 cents is absorbed somewhere en route. I am told that in Europe, where scientific marketing has been worked out, the farmer gets the largest share of the dollar, and this is manifestly just.

I believe that the state market act is one of the most important laws ever enacted in the state of California. It embodies the possibility of benefiting every man, woman and child in the state. Its purpose is to

make living easier for those who are struggling with adversity, those who are struggling to lift a mortgage from the home, those who are striving to provide a decent living for their families and to earn a little more than the mere cost of living so that they may educate their children.

If we are enabled to create even a modicum of the benefits herein outlined this act will have rendered a most valuable service to the state in making possible a more substantial and satisfied class of citizenship, and after all this is the true mission of law.

NOTE: Even after its experience of nearly a century, Case is not content to publish advertisements unless based on the very latest authoritative information. This is one of a series of messages to farmers, prepared after visiting tractor demonstrations, talking to hundreds of farmers, and carrying on a national investigation through our sales organization and by mail to find the gas tractor needs of the farmers.

A Tractor

Not Too Small
Not Too Light
Not Too Cheap

Whichever size of Case Tractors is suitable for your farms, you can bank on its being the best of its kind in the market, made honestly and conscientiously, to uphold our name and fame. In the field and in our laboratories we have carried on tests and we know from experience what is best to incorporate in a tractor. In its class, each Case Tractor is a masterpiece, embodying all the best features. Why be satisfied, then, with lesser quality? Why choose as your investment a tractor that has fewer years of experience behind it? Case has been in business 74 years. You would not buy an experimental automobile. Then why a tractor except from a company long engaged in making agricultural machinery? To do otherwise is to take an unnecessary risk.

More Economical Than Cheaper Tractors

You want a real, everyday tractor, one that is backed by a reputation. We say that a Case tractor costs less than cheaper tractors because it is built honestly and carefully. Case principles are right, and no

From an Actual Photograph of a Case 10-20

Case tractor is too small, too light or too cheap. Case tractors are built to uphold a name and fame that must not be dimmed, so they will not be claimed by tractor graveyards. The wise farmer who chooses a Case is bound to increase his farm profits. He need never experiment with one tractor and then another. He need never fear that he will be caught with an orphaned tractor on his hands.

"Horse Poor"

Too many farmers are unable to put their farms on a profitable basis. Too many farms are over-horsed, but under-powered. A farm must be put on an earning basis like other businesses. Case Tractors reduce the cost for horses and men.

Case Leads

The Sign of Mechanical Excellence the World Over

The Case Tractors are made in the Case Shops by Case workmen. This includes our specially designed tractor motors. Because of our reputation, you can depend on our engine delivering the power. It is simple, efficient, economical, constant. At all the tractor demonstrations this year, the Case Tractors commanded the attention of thinking, studious farmers, who were planning to do away with costly methods and claim the profits that rightfully belong to them. Men admired Case simplicity, and contrasted our experienced engineering methods with the many types recently introduced. Some men expected to find Case tractors suitable only for large farms, but were pleasantly surprised to find our line included all sizes, suitable for all farms. Case gas tractors are in four sizes—the 10-20, 12-25, 20-40 and 30-60.

Cultivator when writing the advertiser.**CHRISTMAS SUGGESTION**

A subscriber has suggested
that instead of buying objects of art
and inutility for Christmas presents
we choose those things which will be
far more acceptable and pack boxes
of wholesome California nuts, raisins
and dried fruits of all kinds. Noth-
ing could be more attractive.

DAIRYING, SIDE LINE

There are many orchardists in
California who not only buy their
vegetables, but their butter and eggs.
Such specialization is not wise, for
more than once has it led to disaster
if not real suffering. When the one
crop does well, all goes well, but
there are occasions where all is not
going well and where the greatest
profit is not secured by the specializ-
ing process. The cow or two cows
and a good sized bunch of hens not
only saves some of the orchard waste
but returns fertility. We believe that
dairying as a side line in the orchard
will increase. To the orchardist who
has spent most of his life in an office
or following some profession dairying
does not appear so attractive as
orchard work, especially as much of
the work is hired, but we believe that
California's greatest success will
come only when we diversify more.

FINE RAINS

Now comes another fine rain
insuring feed and a coat of green over
all the hills. The first general rain of
nearly two weeks ago was followed by
another coast rain. The two storms
aggregated from one to four or five
inches precipitation in various parts
of the state. The early November
rain was a freak storm coming up
the coast from Mexico. It gave a pre-
cipitation of an inch or more in near-

ly all Southern California sections,
dwindling out till it gave practically
nothing at San Francisco and north
of there. The last two storms insure
the starting of all tree planting and
farming operations and we trust will
reassure many who were beginning to
fear drouth. Such pastures as were
started by the earlier rains will now
make fine growth. Orange growers
have at times been somewhat con-
cerned over the temperature, but no
damage whatever has been done as
yet though the thermometer has
fallen so far in some places that some
smudge pots have been lighted.

But referring to rain, let us sug-
gest; irrigate, and then irrigate some
more. An abundance of water in the
lower depths means success through

compete with them in the manufac-
ture of these by-products. American
ingenuity, however, may be sufficient
to overcome this and produce as
economically as in the Mediterranean
countries. The department of agricul-
ture, as well as the Exchange, has
been making investigations along
this line of conservation which we
believe will add much to the wealth
of our producers.

In this connection we might refer
to the fact that the commerce reports
issued by the department of the in-
terior note that a brewery which was
put out of business at Salem, Oregon,
has been reconstructed and is now
used for putting up loganberry juice.

RURAL CREDIT

When we speak of rural credit
there comes a vision of some great

EVER THINK WHAT ADVERTISING IS?

ELL, good advertising (and that is the only kind you find in the
California Cultivator) means the telling of a story. We read
papers and magazines only to get the pleasure and educational
benefit to be derived from the world's events; stories of travel,
progress, war and catastrophes, stories political, social and
religious, but our editorial pages give little or no information relative to
the mercantile side of life.

Little space can be devoted to the achievements of men who labor
and invent for our comfort at home; hence, the manufacturer must tell
his story by means of paid advertisements in the papers, which accounts
for many of the great conveniences you now enjoy having been first
brought to your attention by this method.

Now think, there is truth in that, and it is this very truth that makes
possible the papers you read today, because without this advertising pat-
ronage or carrying of mercantile stories for profit no farm paper pub-
lisher could afford to give you the paper he does.

It is necessary that you realize this in order that you may appreciate
the advisability of doing what you can to promote this industry of adver-
tising. Spend your money with the people who help to support your
favorite paper, and by so doing you will be a benefit to us all. It is
really your duty as a good friend.

There are many little business stories in this issue of the California
Cultivator, all told by thoroughly reliable people, most of whom are per-
sonally known to us. You can learn something to your advantage by
glancing through our advertising columns. Let us know if you ever
have the slightest cause for complaint. See our guarantee on editorial
page.

next summer. Water once deeply in
the soil will stay there for months if
the surface is kept cultivated. Again
we say; irrigate.

SAVING THE WASTES

The price of lemon oil has been
advanced something like 1000 per
cent. Of course "It's the war". For
our supply of many commodities all
the way from dyestuffs down to lemon
oil and a lot of other things which
Americans have it in their power to
produce we have found during the past
few months that we are dependent
upon other nations. Worse, we are
finding that we are a most wasteful
nation and many things which might
be turned into good money for the
producers are thrown away.

Some of these wastes are now
being saved by plants installed by
private capital and by the California
Fruit Growers' Exchange. These will
utilize hundreds of tons of low-grade
lemons, which at present are either
entirely wasted or worse than wasted
by being sent to the market where
they not only fail to secure enough
return to pay expenses but batter
down prices so that even the best
fruits bring poor returns. From
lemons may be made essential oils,
extracts, citrate of lime, marmalades,
jellies, any number of attractive and
salable products. The trouble has
been that American labor has not
been content to work for the wages
of the European, hence we cannot

movement organized and backed by
the federal government, which aims to
secure to the farmer a lower rate of
interest on money used to increase the
output of his farm. This item does
not have to do with that kind of
rural credit; it is inspired by a remark
recently heard from a banker in
answer to the question, "Why is it
that as a rule the farmer has to pay
a higher rate of interest than the man-
ufacturer?" After denying that, secu-
rity and other things being equal,
the farmer did pay a higher rate of
interest, he said, "You must bear in
mind that the farmer, especially of the
old-time type, often has indifferent
credit to offer, and is indifferent as to
when he meets interest and payments."
In other words, this banker would con-
vey the idea that as a class the farmer
is dilatory in paying accounts. We do
not know whether it is safe to deny
this in toto or to grant that a little
bit of it at least is true. But whether
one is farmer, merchant or manufac-
turer, there is no surer way of main-
taining credit than by prompt pay-
ments. It is conceded that the mer-
chant may be better able to judge of
future transactions than is the farmer,
for the latter has to deal with so many
unforeseen conditions of weather as
well as more uncertain conditions of
market affecting crops. This may ex-
plain why the farmer as a class can-
not be as prompt and as certain in his
payments. But if he is to have credit
under right conditions, neither govern-
ment rural credit schemes nor any-
thing else can secure it for him unless
he so plans as to make prompt pay-
ments.

Agricultural Notes

The Southern Atlantic states im-
port one-fifth of the hay they use.
According to the most recent figures
of the United States department of
agriculture, 1,305,000 tons of hay,
valued at \$17,626,000, are brought
each year into the 11 Southern states.

Government control of the jute mills
in India is announced in dispatches
from Calcutta. Sales of burlap to
private buyers will be contingent on
government permission. This restric-
tion had already been ordered at Dun-
dee, Scotland, the center of British
jute manufacture.

The potash shortage has directed at-
tention to the seaweeds of the Sara-
gossa Sea in the Central Atlantic.
Vast amounts of this weed are thrown
on the coasts of the Bahamas. Experi-
ments show the dried kelp to contain
on an average nine per cent of potash.
The dried kelp of the California coast
has a much higher per cent of potash,

Hawaiian soil is being used to build
up the small coral island in the Pa-
cific known as Midway and used as a
relay station by the Commercial Pa-
cific Cable Company. A quantity is
taken there every three months by
the schooner that is sent with food
supplies for the operators. The task
of building the island has progressed
so far that it is possible to keep a
cow on the pasture.

Our consul at Ottawa reports that
evidence of greatly improved indus-
trial and commercial conditions in
Canada is steadily accumulating, the
splendid agricultural crops being
largely responsible. In some instances
they are more than double those of
the previous year. It has been officially
announced that a domestic Dominion
loan of probably \$50,000,000 will be
offered for popular subscription about
the end of the present month.

Considerable attention is now being
given throughout Canada to a so-
called daylight-saving scheme. The
movement in Halifax is in accord
with an effort all over the Dominion
to have the clock put back one hour
on April 1 each year, continuing to
some autumn month, in order to give
more daylight for work and pleasure.
Meetings are now being held all over
Canada with a view to bringing the
matter to the attention of the federal
parliament at its next session.

There are at the present time 270
farmers' elevators in Minnesota, with
an aggregate membership of 34,500
—an average of 128 members to a
company. The aggregate volume of
business of these companies may be
estimated, approximately, at \$24,000-
600 per annum, of which about \$22-
000,000 represents the value of grain
marketed and \$2,000,000 the value of
supplies purchased for members. In
90 per cent of the companies the
farmers hold practically the whole of
the stock. In all the companies,
farmers own a majority of the stock.

There has been an unusual demand
for Chinese egg products in the
United States during the last few
months, and that market has been so
short that the demand could not be
filled. One American firm which
usually purchased some 30,000 pounds
per annum is practically unable to
procure any part of this quantity at
terms on which the business will
prove profitable. This shortage is
largely accounted for by the fact that
many plants in China are owned by
the Germans, who, finding it impossi-
ble to obtain shipping facilities in
Japanese and British bottoms (which
nationalities control the entire trans-
oceanic shipping from the Chinese
coast), have closed down.

Agricultural News Notes

of the Pacific Coast

Northern California

Oroville, Butte County, estimates its rice harvest at 400,000 sacks.

Shipments of navel oranges are going out daily from Oroville.

A modern fire lookout tower has just been completed on Leek Springs in Eldorado County.

Orland, Glenn County, shipped out 12 tons of dressed turkeys for the Thanksgiving market in San Francisco.

State Horticultural Commissioner Cook has announced that the next meeting of the California Fruit Growers will be held in Napa.

Agents of the French government are in Contra Costa County endeavoring to arrange with stockmen for a carload of horses for shipment to Europe.

The department of agriculture will place men in the Oroville district the coming year to investigate the losses caused by olive thrips and to discover methods of control.

The California Commission of Immigration and Housing has sent out a warning to the unemployed in other states that there is no demand for outside labor in California.

To provide for inspection of dairy herds in accordance with the pure milk law ten additional state veterinarians will be put to work next October when the law goes into effect.

The North Bay Counties Association has decided to extend the work of the organization during 1916. Its annual meeting and election of officers will be held sometime during January.

State Veterinarian Keane says that many dairymen are already cleaning up their herds of tubercular cattle so they may be ready to meet the conditions of the pure milk law which goes into effect October 1, 1916.

Entries are now being made for the California State Poultry Show to be held at Sacramento January 14-18. Premium lists will be mailed to anyone upon request to California State Poultry Association, Sacramento.

At the recent annual meeting of the Farmers' Protective league in San Francisco it was declared the purpose of the organization to fight all efforts of organized labor to put through an eight-hour law at the next legislative session.

The canal from Richvale and Nelson Road to Butte Creek in Butte County has been completed and will be ready for delivery of water at the opening of the irrigation season. The canal is 50 feet wide on the bottom and 70 feet at water line.

The American Poultry Association of California has elected the following officers for 1916: President, L. C. Byce, Petaluma; vice presidents, Robert J. Venn, Fresno, and A. A. Bamford, Gardena; secretary, Henry W. Kruckeberg, Los Angeles; treasurer, M. E. Dillingham, San Gabriel; executive committee, Chas. R. Harker, San Jose; Ben M. Woodhull, Stockton; A. D. Robinson, Point Loma; Jos. E. Davis, Los Angeles; W. S. Russell, San Francisco.

Central California

Salida, Stanislaus County, is promised a cheese factory.

The San Jose grange at its recent annual meeting elected Dr. E. C. Abbott, master.

A bean shipper at Modesto has an order for 35 carloads of beans to be shipped to Stockholm, Sweden.

Peach growers of Hanford raised more than \$6000 in the interests of the California Peach Growers' Association.

California harvested more beans this year than any preceding year. The prices are expected to go up, at least as long as the war lasts.

A stockholders' meeting of the proposed Million Dollar Peach Growers' Association will be held in Fresno January 12 for the purpose of electing 25 trustees.

The Stanislaus County farm bureau will hold a series of pruning demonstrations. The demonstration at Denair will be given on the afternoon of December 13.

Ninety-four cows belonging to members of the Stanislaus Cow Testing Association reached a production of 45 pounds or more of butter fat in the 30 days of November.

Stockmen of Tulare have formed a temporary organization which will be the Tulare County branch of the Central California Stockmen's Association. A. W. Keck of Visalia is temporary chairman.

A practical pruning demonstration will be given in the vineyards of the Kearney ranch at Fresno December 17. F. T. Bioletti and F. C. Flossfeder of the state university will conduct the demonstration.

The Dinuba Sentinel reports many sales of peaches at 4½ and 4¾ cents, with rumors that independent buyers are in the field trying to get five-year contracts from growers at five cents to keep them from joining the new association.

The State Water Problems Conference, created by the last legislature has held several meetings at the office of the state railroad commission in San Francisco to discuss with irrigation engineers and others best way of proceeding to accomplish the work for which they were appointed.

It has been decided to call a mass meeting of prune growers of the Santa Clara Valley for some time in January to discuss the fixing of a reasonable minimum price to which they will hold for the next season's crop. The five-cent minimum determined on by the mass meeting of growers held in May has been successfully held to by the prune men.

Grand prizes at the Panama-Pacific Exposition were awarded to J. V. Falk of Turlock, Stanislaus County, for his display of cantaloupes, samples of which were also used for distribution to visitors from the Stanislaus County booth in the California building; to George C. Roeding of Fresno for his display of Calimyrna figs; L. Poers of Manteca for Malaga grapes.

Southern California

There was a farmer's institute at Paso Robles December 8.

The Valencia season in Azusa shows a total shipment of 77 carloads.

Redlands oranges are reported coloring up very fast and showing high sugar content.

Ventura has closed its walnut harvest and most of the nuts are out of the warehouses.

The packing house of the Richland Walnut Growers' Association finished its run on nuts last Saturday.

Several thousand head of cattle from Southern Utah have been received by ranchers of Paso Robles.

The Riverside County chamber of commerce held its monthly meeting December 10 and 11 at Blythe in the Palo Verde Valley.

The Redlands district has shipped some oranges for the Christmas trade. None except fruits that were well colored have been picked.

Orange County carried off the second longest list of awards of any county in the state from the Panama-Pacific. Placer County headed the list.

The next convention of the State Fruit Growers will be held in San Bernardino in connection with the National Orange Show, February 17-24.

A carload of horses was shipped last week from the Pioneer Ranch near Corona in Riverside County. They were consigned to the British government.

A box of semi-tropical fruits, nuts and vegetables, sent from Garden Grove in Orange County to the Oregon Agricultural College Fair at Corvallis won second prize.

L. A. Webster, editor of The American Sheep Breeder, is visiting Winthrop Howland of Redlands. Mr. Howland has one of the largest Toggenburg goat ranches in the United States.

J. P. Dargitz, recently appointed manager of the California Ripe Olive Association, has been in Southern California olive growing sections discussing marketing problems with the growers.

Two hundred and fifty citrus fruit growers from the Ontario-Cucamonga district attended the all day picnic meeting at the citrus experiment station at Riverside on Wednesday, December 1.

Interest in the proposed poultry school at Riverside is growing. The plan is to hold a short course of two weeks. All poultrymen interested may secure details by writing Secretary Dudley of the Riverside chamber of commerce.

The movement to secure the appointment of a farm adviser for Los Angeles County is progressing with a live committee managing the campaign. There will be a meeting at which Dr. Hunt and Mr. Crocheron of the state university will make addresses at the chamber of commerce at Los Angeles the latter part of December.

The Coast

Arizona's annual state poultry show will be held at Tucson December 16-18.

A large number of silos were erected in the country about Eugene, Oregon, this year.

The next meeting of the state horticultural society of Washington will be held at North Yakima.

Millard County, Utah, held its annual farmers' round-up and housekeepers' conference at Delta December 7-11.

Nevada's state experiment station at Logan held an exhibition the latter part of November. Much fine stock was shown.

Beet growers of Sevier County, Utah, are discussing formation of an association which will stand for better prices on sugar beets.

Strawberry growers of the Yakima Valley of Washington are working on a cooperative association to handle the marketing of their berries.

The Portland Union stock yards report the top price on hogs at six dollars. Five thousand porkers were brought to the yards on one day last week.

The Arizona experiment station is issuing a bulletin "Irises for Southwestern Gardens" written by Prof. J. J. Thornber. It may be obtained on request to Experiment Station, Tucson.

The Utah Horticultural Society, in its recent meetings at Provo and Ogden discussed the feasibility of marketing fruits through canneries which the growers themselves manage.

The Northwest Fruit Shippers' Council has been formally incorporated. The corporation is prepared to undertake a very ambitious advertising campaign throughout the United States.

The Cascade Live Stock Show just closed at North Yakima, Washington, was most successful. Six thousand dollars in prizes was distributed. Plans are already being made for next year's show.

A small apple box containing only one-fourth the quantity of apples held by the standard apple box has proven a popular way for marketing Washington apples, according to a fruit packer of Wenatchee.

The total production of apples in the states of the Pacific Northwest; Washington, Oregon, Idaho and Montana, is estimated this year by government statisticians at 13,238,000 boxes against 14,500,000 in 1914.

The Utah Irrigation Law, authorizing any person desiring water for irrigation purposes to enlarge existing canals after compensating the owners, has been declared constitutional by the United States supreme court.

Potato growers of the Redmond, Powell Butte, and Lower Bridge districts of Oregon have formed a potato growers' association to promote the growing of a better grade of potatoes and secure a better market price.

Live Stock and Dairy

REAL STOCKMEN AND OTHERS

Written for California Cultivator

By W. S. Guilford

WHEN the wet, rainy days of winter come, then is the time that the man who is the real stockman, the one who has the love for his animals as a part of his very nature, has "luck" with his animals, while those who do not have this instinct just cannot understand why things do not go better.

It is just as natural for the born stockman to want to be with his animals during stormy weather and see that everything is all right in every way as it is for him to breathe or perform any other involuntary act. He thoroughly enjoys getting out in the storm and rain and cannot be content until everything is fed and sheltered for the night.

And to this sort of a person there is as much thorough satisfaction and pleasure in this caring for stock in bad weather as music lovers derive from hearing great music well rendered.

That there is no accounting for tastes is doubtless true, but it is a fact that some men are so constituted, and it is a mighty good thing for the domestic animals of the world that such is the case.

There are a great many young men who are attending agricultural colleges all over the country. Some of them are doing this because they know that they want to make some branch of agriculture their life work. Others are doing it because they have to do something and the pictures that have been painted about the life of the farmers are now frequently very attractive. Ten years ago a student studying agriculture in any of the great universities had very little standing and was rather looked down upon. Now the situation has changed and the agricultural course is one of the most popular in the list.

Some of the boys who have made up their minds that they want to specialize in animal husbandry will do well to get out on some real stock farm during the winter season and see if they find anything near to pleasure in being out in the elements caring for stock or if the mud and the wet and the exposure are entirely distasteful to them. If the latter is the case it would be well to look about for some other life work—the chances are that he is on the wrong tack and the sooner he gets into something else the better.

This applies with equal force to many of the "back to the landers" who have been led to believe—or have led themselves to believe—that wealth and contentment is by way of making payment on a small piece of land. There are many who will succeed because "they have it in them"—there are some others who had better be somewhere else.

Testing the best cows in a herd has value only to breeders selling stock as an advertisement, but testing the whole herd is of the greatest value to all dairymen as an economical proposition; there are greater differences between the yield of individual cows of the same breed than between the average yield of different breeds.—Hansen's Dairy Bulletin.

CALIFORNIA SWINE BREEDERS' ASSOCIATION SALE

A letter from Secretary J. I. Thompson of the California Swine Breeders' Association calls attention to the coming auction sale to be held at the state fair grounds at Sacramento January 27. Regarding the entries Secretary Thompson says:

"Because the entries will evidently be much larger than can be handled in one sale in a day it seems absolutely necessary to limit the number entered by each man to five, and should those entered exceed the number that can be handled in one day it will be necessary to reduce each entry somewhat. Will you, therefore, kindly list your entries in the order in which you are most anxious to sell them, viz., put first, second and third hogs that you prefer to sell, so that if is necessary to cut one or two of your entries off, the last one or two will be removed."

An entrance fee of \$3.00 per head will be charged. Entries close December 25. Hogs must be shipped at owner's expense and charges prepaid. Only members of the association may consign hogs. Membership fee is \$1.00 and the Secretary, J. I. Thompson, may be addressed at Davis.

Entry blanks are now being sent out to all members of the association. It is requested that everyone making entries shall send pedigrees. Every hog in the sale must be registered; the fact that a hog is eligible but not yet registered is not sufficient.

The association guarantees that "Every animal sold will be guaranteed to be a breeder by the consignor, and should any animal fail to breed equally as good an individual that is a breeder will be given by the seller in its stead. The guarantee only binds the breeder selling the animal."

The annual meeting of the association will be held January 26 at Sacramento.

BERKSHIRES SELL WELL

Written for California Cultivator
By Sacramento Valley Contributor

If the recent sale (Oct. 14) of Berkshire hogs, farm stock and machinery at Clark Acres near Willows is to be taken as an indication of financial affairs among farmers of Glenn County, things are in very good shape. Everything sold well and competition was keen.

About 100 head of Berkshires sold at from about \$15 for pigs to \$65 for sows.

This was considered very satisfactory in view of the fact that the herd has never been exhibited, has not been advertised extensively, and the animals have never been fed or cared for as Mr. Clark has felt they should have been.

Local buyers took all of the offering which, because of the facts enumerated above were good bargains for the purchasers. James Mills of Hamilton City bought over 50 head to add to his splendid collection of Berkshires; O. L. Raper and G. C. Clare of Glenn bought several choice ones to add to their

First Annual Auction Sale of Purebred Hogs

under the auspices of the

California Swine Breeders Association

will be held at the

State Fair Grounds, Sacramento, Cal.

on

January 27, 1916

100 head of pure bred hogs of various breeds will be sold. These represent the tops of some of the best herds to be found in California. All hogs sold will be registered and will be guaranteed breeders by the consignors. The catalogs will be ready about January 12th, and can be secured of

J. L. Thatcher, Riverside, Cal.

or J. I. Thomson, Davis, Cal.

herds; Senator Claude Purkitt se-
cured a boar for his Hamilton City
ranch; N. W. Belleville of Glenn, who
has several registered animals,
bought a boar; A. C. Derbrow of Wil-
lows bought several sows, as did C. O.
McAuliffe. The herd boar, Royal
Masterpiece 18th, went to Schneider
& Waller, Glenn, who have a good
lot of sows to mate with him.

* * *

Great progress is being made in
Glenn County along live stock lines.
Dozens of herds of registered hogs
are being established and in addition
to the pure bred cattle herds there
are very few grade herds in which
registered bulls are not being used.
J. L. Windell of Glenn is establishing
a flock of registered Shropshires—
stock being secured from one of the
most prominent Eastern breeders.
More will be told of this soon. And
at Butte City Ranch at Butte City
one of the best herds of Berkshires
in the West is being established.

The number of pure bred herds and
flocks is increasing not only in the
older settled parts of the county but
particularly on the Sacramento Val-
ley Irrigation project and the Orland
government project. Many progres-
sive Eastern breeders have bought
irrigated land and are continuing
their operations here, and many other
enterprising farmers and business
men who have bought these lands
realize that only with pure bred stock
will the greatest possibilities of Cali-
fornia agriculture be developed.

HAVE HOGS HEALTHY

Keep hogs thriving; strong, healthy
hogs resist cholera.

Quarantine every hog dead from
cholera; the law requires it.

Lice, worms and unsanitary condi-
tions weaken hogs and invite cholera.

Disinfect hog yards occasionally
with unslaked lime; it's good cholera
insurance.

Serum and sanitation make the best
preparation for the warfare against
hog cholera.

Keep cholera hogs and carcasses
away from the stream and insist that
your neighbor do the same.

The straw shed for hogs is almost
sure to be either damp or dusty.
Either condition invites disease.

Keep gunny sacks saturated with
crude oil where hogs can rub against
them. Raise more hogs and fewer
lice.

Kill lice with crude or fuel oil
sprinkled on the hogs at feeding time,
applied to rubbing posts or used as
a two-inch layer on top of the water
in a dipping tank.

Coughs and pneumonia from dusty
beds may incidentally be prevented if
louse infested beds are oiled. Breath-
ing dust may cause death from pneu-
monia and certainly renders hogs less
resistant to cholera.

Sprinkle freshly slaked lime about
one-sixteenth of an inch deep over
the lots, sprinkling quarters once
every month or two. At this rate a
barrel will kill the germs on about
1280 square feet of lot space. Combat
worms by feeding a mixture of four
quarts of charcoal, three parts of
copperas, three parts of common salt,
three parts of Glauber's salt, three
parts sal soda, one part sulphur. Mix
in 100-pound lots and keep in a dry
place where the hogs can help them-
selves. It is a good conditioner and
has been thoroughly tested at the Mis-
souri agricultural experiment station
and on many farms.

Corn in the silo is like money in
the bank—ready for use when most
needed.

Why Do Dairy Cows Run Down?

No other farm animal is the cause of so much anxiety to the
owner as his dairy cows; sickness gets in in spite of the best
of care.

Why?

Because the dairy cow is subjected to
constant forcing to get the maximum in
quantity and quality of the milk yield.

This constant strain
proves too much for
many a good cow;
some important

function becomes impaired and for want of proper
medical assistance she becomes a "backward" cow.
In just such cases as these Kow-Kure has made its
reputation for success when used to

Raise the Health Standard

of the herd. Kow-Kure is a medicine for cows
only—not a stock food. It has wonderful
medicinal qualities that act on the organs of
production and reproduction for the preven-
tion or cure of many serious cow
ailments. It is especially useful in
cases of Abortion, Barrenness, Milk
Fever, Scouring, Lost Appetite,
Bunches, Retained Afterbirth, etc.
Farmers who used it keep Kow-
Kure on hand constantly. Most
feed dealers and druggists sell it.

KOW-KURE
GARGET KURE and BAG BALM

17 Cows-450 Quarts Milk
Enterprise, Kan.
Gentlemen
I like the EMPIRE better every day. I
am milking 17 cows—getting 425 to 450
quarts a day. On heifers I have better
success than on old cows. They stand
better for machine than by hand. How-
ever, the old cow after a week takes all
right to her new calf.
Yours respectfully
A. H. DIEHL

Empire Mechanical Milker

The firm and gentle massage of the
teats by natural atmospheric pressure
coaxes the cow. She responds gen-
erously—in many cases gives even more
milk than before. No compressed air
used. No chance for sore, inflamed
teats or udders. No dirt, germs or stable
air comes in contact with the milk.
One double or two-cow Empire unit
takes care of 20 to 30 cows per hour.

One man can attend to two double units.
Everything rapid, clean, sanitary. In-
stallation simple, easy and inexpen-
sive. Only one tank—one pipe line.
Let us send you full description and
pictures of Empire Milkers and Empire
Cream Separators that are making
good in many fine dairies. Ask also
for our offer on the Empire Gasoline
Engines and Empire Star Feed Mills.

DAIRYMEN—
YOU
can get from
one to five pounds
more milk per cow
a day by simply feeding—
Larrowe's DRIED BEET PULP

FIGURE out what this extra milk production would mean to you in the course of a year and you will find it well worth while.

Discard high priced mill feeds. Put your cows on a straight alfalfa and dried beet pulp diet—and not only **save** money but **make** money.

Larrowe's Dried Beet Pulp is more than a food; it is a splendid conditioner as well. Read what one of California's most prominent dairymen says:

"When we fed corn silage our heavy producing cows remained in such poor condition that we were continually having some sick with some ailment or another. As soon as we changed over to alfalfa and dried beet pulp exclusively we noticed immediately a great gain in weight and improvement in physical tone, and they have ever since been maintained in what several prominent breeders have told us is 'almost perfect show condition.' A sick cow is now practically unknown in our dairy."

—is clean, wholesome, appetizing; aids digestion; contains five times as much nutriment as silage, with as great or greater succulence—swelling to fully six times its original bulk when moistened.

GO TO YOUR FEED DEALER TODAY and order a single 100 lb. sack of either the plain or molasses dried beet pulp. Ask for Larrowe's. Test

it on one cow whose milk record you know—and watch results.

FREE! Our Booklet "Profitable Feeding"

—containing valuable information on feeds and feeding. Should be in the hands of every dairyman. Write for a copy—today.

THE LARROWE MILLING CO.

933 Central Building

LOS ANGELES, CAL.

CARE OF DAIRY CALVES

Careful attention on the part of a dairyman during the two weeks that follow a calf's birth will often mean the ultimate addition to his herd of a large, well developed milking cow, instead of a sickly, undersized, stunted animal. The problem of raising calves is today a more complicated one than when it was customary to feed a larger amount of whole milk. The dairyman will therefore find it to his advantage to take the best possible care of his calves from the very beginning.

Immediately after birth the navel of the calf should be washed with an antiseptic solution and tied with a silk thread in order to prevent infection. For the first feed the calf should have the first milk from the cow after calving and should have its mother's milk for several feeds thereafter. The sooner the weaning takes place the better, but ordinarily it should not be postponed later than the fourth day. The sooner the calf is weaned the more easily it is taught to drink. When first fed from the pail, eight to ten pounds of milk a day, fresh and warm from the cow and divided into two feeds, are sufficient. The feeding times should be as nearly regular as possible, and at first it is advisable to feed more than twice a day. The amount fed should be constant; and to insure this, scales should be used, as variation tends to get the digestive organs out of order. At all times the utmost care should be taken to prevent any digestive disorder, as all such trouble hinders the growth and development of the animal. Calf scours is the most common indication of this condition.

The following named precautions, to a great extent, tend to prevent scours:

Feed regularly.

Be sure that the milk is always sweet and warm.

In feeding use only clean pails.

Feed the calf a little less than it wants.

Reduce the amount of milk one-half if the animal becomes sick.

The amount of milk fed can be gradually increased until at the end of the second week the calf receives from 14 to 16 pounds of milk a day. At this time the gradual substitution of skim milk for whole milk may commence. Hay and grain should be placed before the calf at this period, and it will be found to nibble at them a little. At the end of the third week

the substitution of skim milk will be complete. By slow changes the milk can be increased thereafter until 20 pounds a day are fed; this amount will be found sufficient when fed with the grain and hay. If skim milk is plentiful more may be fed, but the added amount will not give proportionately better results.

Corn meal, bran, and oil meal, mixed in the proportion of three, two, and one, make an excellent grain mixture. This grain when fed with plenty of fine clover hay makes an ideal supplement to skim milk in balancing the ration.

Calves should be allowed all the grain that they will eat until they consume three pounds a day; from this point the feeder should use his judgment as to whether an increase is justified.

The calf, from the time it is two weeks of age, should always have access to plenty of clean, pure water.

The general practice is to feed calves skim milk for from two to six months. In the latter case, with fall calves the time of final weaning from milk comes in the spring, when pastures are ready. Under this system the calves usually make excellent growth during the entire period without any break in gains.

KINGS COUNTY POLAND-CHINA BREEDERS

Kings County Poland-China breeders have announced a sale of pedigreed Polands to take place at Hanford on Saturday, February 5, at the pavilion. "It's under roof, so every one come, rain or shine," says Acting Secretary Newton. A hundred and fifty hogs from the herds of Messrs. Bernstein, Smith, Trewhit, Gilkerson, Ross, Dimmick, Bassett, Henderson and Crawshaw will be consigned.

The association assures us that a genuine roast pork lunch will be served at noon and adds "The breeders are out to raise the general standard of hog raising in California and to this end are sacrificing some of their best at this sale in order that others may get started in the right direction." Many of these offerings are from P. P. I. E. prize winning herds and all are to be sold.

Hog raisers and others interested in the swine industry met at Phoenix, Arizona, Wednesday and held a most interesting session.

THE VIGOROUS HEN—HOW SHALL WE KNOW HER?

Written for California Cultivator
By Jean A. Koethen

HERE seems to be no one "secret" for the development of a strain of prolific layers. Selection is of course the slogan for like begets like. We must breed from the best but how pick out the best? The trap nest is doing wonders in this respect. Perhaps there is no test quite as sure if layers are wanted, and yet we are told that the best layer is not always the best breeder, that the heavy layer may have her vitality so sapped by heavy laying that she cannot pass on her own good qualities to her progeny. On the other hand, we are also told that a hen must have constitutional vigor to begin with or she cannot be a heavy layer.

Doubtless the desirable breeder, male or female, must be vigorous. If it is not the chicks for which it is responsible will fare badly in this chilly world. But vigor is not the only qualification of a breeder, basic as it is. I have seen many vigorous hens that were indifferent layers and persistent sitters. To breed from them indiscriminately would be foolish. Let us say, rather, not every vigorous fowl is a good layer or a desirable breeder but the desirable breeder must have health and vigor as fundamental qualities or we are wasting time breeding from it.

After reading in the Cultivator of November 11 Mr. Stickney's quotation from a California expert to the effect that he knew of no way to pick out the vigorous hen I rushed to my pen of select pullets and sat down among them to see if they wouldn't tell me some secret by which the most vigorous might be known. I saw at once that Mr. Stickney's test of the round, broad-backed shape would not work with Orpingtons, however well it might with Leghorns, for all Orpingtons have fairly broad, blocky backs, and these pullets of mine all felt exactly alike. All but one of the 20 had bright red combs. The one exception was a pullet I recognized as one I had hesitated to put in the pen because her comb was slow in developing. Her comb was now smaller than those of the others and not so bright, and she stood "hunched up" in a way I did not like. I shall certainly not select her for a breeder next year, for she is not the best.

There is something in shape, no doubt, when it comes to either vigor or egg production, but I believe there is more in behavior. Take the hen that is loafing in the shadiest corner, as some of mine were that day. I wouldn't pick one of them as a breeder, though they are probably only a bit lazy. The biddies that come to meet me, talking and singing, that are always picking around for something to eat, always first at the feed trough, and last to go to roost, are the biddies I want in my breeding pen.

We must remember that we do not need many breeders. Six or eight or ten hens are sufficient, if only they be the very best. It is not therefore

necessary to settle every hen's exact rank in the scale of vigor. The laying test is different, and many a hen that is worth keeping a year for the eggs she lays is not worth keeping a second year in the breeding pen. It ought to be possible, in almost any flock, to select six hens that are unquestionably vigorous, even if we do have to let the majority go unclassified.

I think we shall find if we study our hens carefully that there are in general four marks of the vigorous hen: 1. Activity or alertness, which I have already mentioned. 2. A bright red comb. 3. A solid body. 4. Shining plumage. A hen may be "under the weather" for some reason or other, I suppose, and still be a vigorous hen but she is open to suspicion. For instance, I noticed that one of my yearling hens, which are now molting, had a pale, shrunken comb while all the rest in spite of the molt kept their red combs. When we needed a chicken for the table the choice fell on her as the least desirable breeder and then I discovered that she had a crooked breastbone which would inevitably have unfitted her for a breeder. A crooked breastbone, it is said, no matter how it is caused, is always a sign of inferior vitality and I have often found, after selecting a hen because of her sluggish bearing or pale comb, that she bore concealed this sign of weakness.

When I mention "a solid body" as a mark of vigor I mean that the bird, when held in the hands, feels firm and solid to the touch—not fat, for fat is by no means a mark of vigor—but just solid. A small, relatively thin bird may be solid and muscular, as any Leghorn breeder can testify. A bird with a flabby "feel" is as suspicious as one with a pale comb.

A healthy hen is always glossy, except in the molt. For some reason a weak bird frequently fails to secrete the oil necessary to keep the plumage glossy and shining. The feathers of a sick bird are always rough and dry. The drooping tail is also a sign of want of vitality. The sick bird always holds the tail low and the bird of low vitality is more or less inclined to the same carriage. Select for a breeder the hen that holds herself upright and carries herself with a spring as if she found life worth living.

I do not know that it is possible to classify and pigeonhole absolutely the signs of constitutional vigor but I do know that, whether or not we can exactly define it in all respects, there is that in the carriage and appearance and manner of the vigorous hen, her way of meeting the problems of life, if you please so to name it, that marks her almost infallibly. There are doubtful birds, plenty of them, but the birds of superior constitution shows it. Sometimes we may know her by her "wicked eye." I had such a Buttercup last year. She drove every other hen away from the feed hopper and would have driven me away if she could.

But it is by no means necessary or wise to wait till a hen is a hen to select for constitutional vigor. Se-

lection is far easier in the months preceding maturity. The chick that is first out of the shell may safely be marked as probably the most vigorous and the last hatched is more often than not hardly worth hatching at all. The chick that stands in a corner and looks droopy while the others are hopping about looking for food might well be culled out for it will probably die anyhow. The chick that is behind the others in growth and the chick that feathers too slowly are both culls. The pullets that feather out first and the cockerels that first show comb are the most vigorous of the bunch and should be banded. In most cases these are the pullets that when laying maturity has arrived will be cackling and singing and hustling for food. These early signs of vigor ought never to be neglected. It is a great help, if all pullets look alike at nine or ten months of age, to remember that this one kept hustling right along from shell to laying house and that that one lagged a little bit.

It is time we got down to brass tacks and did away with the haphazard methods that handicap the amateur poultryman. We take each season's chicks by faith believing that if last year's developed into fair layers these will. My neighbor said the other day: "I don't see why I'm not getting more eggs this fall. My hens did so well last winter." A question or two brought out the fact that this year's hens were from entirely different stock and she knew nothing about the antecedents of either lot. Very likely the owner didn't, either. So many back-lot poultry keepers buy a male bird wherever they can, if only he is cheap, and breed him to whatever hens happen to be laying. There is no fun in that sort of breeding and mighty little profit.

I'm hoping that some day a race of amateur poultrymen will arise who will keep good poultry for its own sake, and not for the sake of the scanty dollars they may wring from the pockets of a gullible public. I'm hoping the day will come when every back yard will be the home of a dozen or so choice, bred-to-lay hens, all of one breed. I pass such a place every time I go to the city. The birds are Barred Rocks and the sight of them, ranging over a green field, is a sight for sore eyes. Not a buff or a red to mar the harmony. I'm looking for the time when every person who keeps chickens will seriously try to learn the principles of breeding and will not be satisfied unless his stock improves from year to year. Till then, let the slogan of every poultry lover be, "Quality first."

In selecting a site for the poultry house remember there is no germ killer like sunlight, and it is far cheaper than anything that will ever be placed on the market. Another thing to be watched is the problem of drainage. Damp, low ground, no matter how well the hen house is sheltered, is not suitable for a chicken shelter.

FARM LANDS FOR SALE

Farm Lands—20 Years to Pay. Fertile farms in Western Canada offered by Canadian Pacific Railway Company. Productive soil; good climate; ready markets; fine churches and schools; unexcelled transportation; all conveniences and opportunities of best farming districts anywhere. Prices \$11 to \$30 an acre; irrigated land from \$35. Loan of \$2000 to assist practical farmers in irrigated districts. Twenty years to pay—or sooner at your option. Long before your final payment is due your farm will have paid for itself. Also some improved farms with houses, barns, wells, fencing, and crops now growing on them on the same favorable terms. Interest in all cases only 6%. This offer is based on good land; we offer these terms because we know a farmer on our lands can "be successful"; he can live well and save enough to pay for his farm. Western Canada lands are naturally suited to growing grains, fodders, vegetables, dairying and raising horses, cattle, sheep, swine, poultry. Cash in on the high grain prices. Don't delay; the best lands will be taken first. Write today for free handbook and full information to J. S. Dennis, Assistant to the President, Department of Natural Resources, CANADIAN PACIFIC RAILWAY, Calgary, Alberta, Canada.

Carlsbad Irrigated Farm Land—Bordering ocean; on state paved highway and Santa Fe Ry.; 80 miles south of Los Angeles; government records show Carlsbad warmest in winter, coolest in summer of any spot in Cal.; deep sandy loam, model water system; low rates; lemons mature in summer when price is highest; immense profits in fruits and berries adaptable to coast territory; winter vegetables without competition; minimum temperature 1914 was 41 degrees; tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre; easy purchase terms. South Coast Land Co., G. Buxton, Sales Agt., Carlsbad, Cal.

FARMERS WANTED
VICTORIA, AUSTRALIA, offers special inducements. Government land, water, railways, free schools, 3 1/2 years to pay for farms adapted to alfalfa, corn, sugar beets, fruit, etc. Climate like California. Ample markets. Reduced passages for approved settlers. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 637 Market St., San Francisco, Cal., Box 8.

One Hundred Acres \$75 Per Acre Rice Land, Best in State for Sale—In a locality where rice is being grown now profitably. This soil is suitable for grain and alfalfa; in a section of Kings County which stands preeminent in farming circles for large crops. Write for particulars or call. Large or small tracts on easy terms. Hanford Real Estate Co., Hanford, Cal.

Adjoining the town of Concord and our farm are small tracts, just the thing for poultry, fruit and berries, which can be sold on rental terms, and we will assist buyers in many ways to get started in the poultry business. VALLEY POULTRY FARMS, Box 188, CONCORD, CAL.

Ten Acres Navels, 15 years old, 108 trees per acre. Water interest in well, cost about \$9 per acre. Concrete pipe line with standards. Early fruit. No smudging. Trees in good condition. Price \$6500. No trade. Address P. O. Box 806, Los Angeles, Cal.

Farms for Sale, Trade, Rent; any state; list free. 167 Farmers' Exchange, Denver, Colo.

Special—Mv 50-acre ranch home; 8-room plastered house; 12 acres bearing walnut; 26 acres rich bottom land; 12 pasture and wood land; water abundant; 7 acres in alfalfa. No exchange. Box 2, Arroyo Grande, Cal.

For Sale—Forty acres level, well watered land, two miles north Waukena, Tulare Co., Cal., taken under mortgage for \$35 per acre. G. F. Stevenson, 329 Laughlin Bldg., L. A.

Free Booklet. County Sectional Maps showing U. S. Land, \$2.50. Any Co. State Map, \$2.50, showing 600,000 acres SCHOOL land. Jos. Clark, Sacramento.

2500-Acre Improved Grain and Dairy Ranch in Klamath Co., Ore. All bottom land, well watered. Owner, 420 Palm St., San Diego, Cal.

Wanted—Farms; have 2357 buyers. Describe your unsold property. 167 Farmers' Exchange, Denver, Colo.

MISCELLANEOUS

A Beautiful White self-bleaching, hard water soap; odorless and will not chap the most delicate hands. I am a hotel man and it was necessary to find a soap that would bleach and do perfect work and not ruin the linen. I tried many kinds of soap, but they were not satisfactory, so I began to experiment, and, after a number of years, I found the secret. It costs a fraction compared with the common soaps. I can make 50 pounds of bar soap for 40c. It positively does all I say and is easily made; just follow directions. I will mail this formula to any address on receipt of 25c in coin. E. C. Baxter, P. O. Box 421, Idaho Falls, Idaho.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

Dried Flgs—Calimyrna seven cents; black 5 cents per lb. for 25 lbs. or more. Tribble Nurseries, Elk Grove, Cal.

RABBITS

Richey's New Zealand Red Rabbits won again at Riverside Fair, 3 medals and 3 ribbons. Beautiful B. Rock Cockerels for sale \$5.00 each, from Blue Ribbon stock. MRS. C. A. RICHEY, R. 3, Box 557, LOS ANGELES. Send 25c for booklet "Making a Living on an Acre" and "Care of Rabbits."

Caldwell's Royal Red New Zealand scored and sold on merit. Catalog free. Caldwell Bros., Box 613R, Los Angeles.

LIVE STOCK

Big Type Poland Chinas—December and January are the best months to breed sows for spring litters. Don't you need a better sow—one that will sire pigs that will grow faster and larger and get ready for market quicker on the same or less feed? You can't make any money at the present market price unless you raise good ones. Scrubby scrubs never pay. One of my May boars, sired by IOWA WONDER, will pay you well. Price \$20.00 each. They will not last long at that price; better hurry. Bred sows, bred gilts, open gilts. One to a carload. 600 head to select from. Satisfaction or money back. Registered and transferred free. Geo. A. Smith, Corcoran, Cal.

Billiken Herd of O. I. C. Swine—The big white kind. Early maturing, weight carrying; everything immunized against cholera by the simultaneous treatment. Pigs of both sexes from March, April, May and June farrows. Sires Chief Again, Iowa Boy, Missouri Lad and Woodview Earl. Dams are all of the big, smooth type and very prolific. Minneapolis, Minn.

Wanted—To hear direct from owner of
good farm or unimproved land for sale.
C. C. Buckingham, Houston, Texas.

Heavy snowfalls have driven the
sheep from the ranges of Utah and
sheepmen are having troubles in find-
ing sufficient pasturage.

for writing out a mortgage? Is there
a maximum charge? Would it be
more for a mortgage of \$5000 than
for one of \$1000?—Subscriber, Parlier.

The cost of making out deeds and
mortgages varies all the way from
nothing up to two or three dollars,
or possibly even more in a very com-
plicated instrument. The more com-
mon charge, however, is 50 cents to
one dollar.

Feeding Spineless Cactus

Some years ago I purchased several
slabs of spineless cactus after read-
ing advertisements of their great for-
age qualities, but as yet I have failed
to get either cattle or hogs to eat
them in the whole slabs or when cut
in pieces. Kindly inform me as to the
proper method of feeding the cactus
and whether it is worth the trouble?
—Subscriber, Dinuba

We believe this is one trouble with
the feeding of spineless cactus. As
an inducement, however, we have
heard of slicing the slabs and sprink-
ling over liberally with bran.

Planting Walnuts

Could one successfully, and would
it be practicable, to plant walnuts in
a seven-year-old peach orchard, set-
ting in the squares at about the usual
distance apart?—Subscriber, Hemet.

Certainly not as successfully as if
the ground were entirely cleared of
the old trees and the new ones given
entire possession. Peach trees or
that age are practically interlacing
their roots. Thorough subsoiling and
cutting of the roots, reaching to the
centers, might aid and fair walnut
trees be secured, but growing two
orchards at the same time on prac-
tically the same ground is a most
difficult task.

Currants

Will currants do well along the

Southern California seacoast? What
is the best variety? Where may cut-
tings be obtained? Where are cur-
rant grapes grown in this state?—
Subscriber, Davis.

The so-called Zante currant to
which we presume the writer refers
has been tried in California with in-
different success. It has not at least
come up to our small seedless grapes.
We would like to hear from any sub-
scriber who has had experience with
this form of grape.

At the Cascade Live Stock Show re-
cently held at North Yakima 72 head
of registered Holsteins were sold at
public auction, bringing an average
price of \$221.87 per head. The high-
est priced cow brought \$950. She was
Jacoba Choicest Mercedes 2nd, the
first Yakima Valley cow to produce
better than 30 pounds of butter in
seven days. She was the property of
W. M. Nelson & Son and was sold to
F. S. Stimson of Seattle.

Deciduous fruit growers of Los An-
geles, Riverside and San Bernardino
Counties met Saturday, December 11,
at Ontario, to consider plans for the
formation of the San Antonio Grow-
ers' Association, which contemplates
marketing fruits of members through
the California Growers' Association.

During the Imperial Valley agricul-
tural assembly Secretary Wallschlae-
ger of the Citrus Protective League
will give a talk on the relation of
efficient marketing to the farmers'
profits. The assembly also hopes to
have Col. Harris Weinstock, recently
appointed state market commissioner,
come to the valley at that time.

Only 700 tons of raisins remain in
Dinuba vineyards.

Questions

THE EDITOR

and Answers

AND STAFF

Questions to be answered in this de-
partment should be received at this
office one week before reply is expected.
Write plainly on one side of the paper
and sign full name and address. Un-
signed communications receive no atten-
tion.

Winter Pear—Blight

On page 547 of our issue of Decem-
ber 2 the statement was made that a
treatment for pear blight was spray-
ing with Bordeaux just before the
buds burst. The Cultivator has often
made the point that the only effective
treatment against pear blight is the
pruning knife and we regret very
much the statement as it appeared.
We must face the blight situation
with the pruning knife or our pear
orchards must give way. The state-
ment referred to called forth a let-
ter of correction from Mr. A. L.
Wisker of Grass Valley. Mr. Wisker
writes:

"Spraying for blight is just about
as effective as a skin wash would be
for tuberculosis in the human family.
The only spray that is of value is one
that controls such insects as aphids,
which sometimes act as blight car-
riers from twig to twig or from trunk
to root, and this part of blight control
is of secondary and not primary
value. My catalogue gives the recom-
mendations of the highest authorities
briefly condensed as follows: "Boiled
down, the blight situation resolves it-
self into this: Japan roots; resistant
varieties (Anjou, Bosc, Comice are
more resistant than Bartlett); avoid-
ing soils, fertilizers, and cultural
methods that lead to a rank, spongy
growth in the tree; vigilant inspec-
tion; pruning out all points of infec-
tion; treating every cut and the prun-
ing tools after each cut with antisep-

tics such as bichloride of mercury
properly applied; and gathering up
promptly and burning the infected
parts. Successful control will follow
these methods—but the work is no
job for a lazy man or a woodenhead.

"There are only two late pears that
answer your subscriber's require-
ments of a pear that is perfectly
adapted to the table and to canning.
These are Anjou and Comice, both
much more blight-resistant than Bart-
lett and of highest quality. Winter
Bartlett is a pear of very slight
merit and has not made the least
headway as a desirable variety. Ja-
pan-root trees will do well in shal-
low, granite soils if irrigated."

Pear blight treatment was given in
our issue of November 4, written by
Percy Gammon of Sacramento
County.

Alfalfa Unthrifty

A subscriber at Burbank has sent
roots of alfalfa, tops of which are un-
thrifty and yellow as if lacking
water. They were, however, abun-
dantly supplied with moisture. These
roots were submitted to the pathologi-
cal laboratory at Whittier and Mr.
C. O. Smith answers:

"I have examined these roots
microscopically but cannot find any
sort of fungus or other organism in
the tissue. On the leaves there is a
very common fungus spot, but I do
not think that this has in any way
affected the vitality of the plants."

The Household Department

THE CHRISTMAS GUEST

Whoso shall come my way this night,
By moor or hill or shore,
For him the blessed candles' light,
For him the open door.
(Oh, Mary, this for thy Son's sake,
Though mine comes in no more!)

My hearth is swept, my Yule logs burn,
My board is decked and spread;
For any who may seem in turn
Are warmth and wine and bread.
(Oh, Mary, grant my son this night
Be housed and comforted!)

Bid, banned or beggared come for guest,
My heart shall share his woes,
And on his head my hand shall rest
To bless him ere he goes.
(Oh, Mary, grant my son this night
That blessing and repose!)

This night, for thy one Son's dear sake,
Wait light and warmth and wine.
Oh, Mary, we be mothers both!
Take these my tears for sign,
And this I do for thy sweet Son.
Wilt thou not do for mine?
—Theodosia Garrison.

BEING ORIGINAL

"Well," said Mrs. Steelby, sighing with a somewhat weary complacency, "today I really did a good day's work, John."

"How's that?" queried Steelby, briefly, attacking his chop with fervor.

"You know how rushed I always am at Christmas, John," explained his wife, "so that I get packages all mixed up and send people the wrong articles by mistake."

"For instance, that little break of mailing pink baby booties to our esteemed bachelor uncle," John suggested.

"Yes," agreed his wife, hastily. That particular blunder was still a sore point. "But more than that, John, it's the foolish selections you make when you are hurried. You don't have a chance to show any originality. Mrs. Briggs, who talked beautifully at the club Wednesday, showed us that it was a positive insult to our friends to give them things picked up in a hurry at the last minute, so I made up my mind to be as original as I possibly could be in every single case. So I caught the 9:15 train this morning and simply put in the day downtown, looking for things."

"But it is such a satisfaction to know that you have accomplished a lot," pursued his wife, dreamily. "I don't mind being all tired out and missing five calls and tearing my lace waist in a basement bargain department. I feel very grateful to Mrs. Briggs for putting it into my head to be really original this Christmas."

"What did you get?" inquired Steelby, with his first real appearance of interest. He placed his napkin on the table and sat back in his chair, much soothed in spirit by an excellent dinner, and prepared to listen to a long catalogue of novel and striking purchases.

"I got—" began Mrs. Steelby, impressively, and paused. "I got," she went on after a moment, checking off the items on the fingers of her left hand, "six monogram handkerchiefs for Ned, a game for Willie and calendar for Sue, a box of notepaper for each of Cousin Harry's children, a book for your sister, a necktie for each of your brothers, and for you—a big, lovely box of cigars!"

For a moment Steelby remained staring at his wife. Then he burst into a roar of laughter.

"Original!" he gasped, between paroxysms. Finally he quieted down and wiped his eyes. "Let's sample that box now, Mrs. Steelby," he suggested.—Chicago Daily News.

THE CHRISTMAS PROBLEM

Written for California Cultivator
By W. M. T., San Bernardino

I want to share my Christmas plans with the readers of the Cultivator, and hope that many others may get as much joy as I have by following some similar solution of the Christmas problem.

At first it just seemed I could not do anything this time, as we all know this has been rather a hard year, but the nearer the time came, I just had to get busy for I could not stand to think of letting the holidays pass without even trying to make some one happy.

So I have been having the nicest time doing my shopping at one "department store", in other words at home. Really, I have never had so much pleasure in preparing Christmas gifts before. I suppose it is because it is all so different and again I am not worrying about the money that I would have spent had I bought all my little gifts, for we all know how easy it is to spend money doing Christmas shopping; it fairly seems to evaporate. Ten and 15 cents, a dollar here and there, and before we have remembered half our friends and relatives we're wishing there never was any Christmas at all.

First I began making little aprons and dust caps; it is really surprising how much good material one has on hand to work with that you don't think of until you begin going through your scrap bags, etc. The many little scraps left from summer dresses and nice pieces of new laces which can be made into caps and aprons are always sure to please our friends.

Next I have written lots of cheerful Christmas letters and have slipped in kodak pictures that my husband took of our pretty little house and of the children. And for my friends and relatives close at home I have been preparing little hanging baskets. I had such a pretty bed of parsley this summer, so I took several five-pound lard pails and painted them white, put in rich soil and filled them with green parsley. I think these will look very pretty hanging in one's kitchen or sitting on the window sill and besides those sprigs of parsley will be much appreciated as a garnish around meat or salad. I also divided some of my pretty ferns and started young ones in flower pots.

This summer I put up so much fruit and pickled peaches, cucumber pickles, tomato catsup and canned sweet grape juice and I am going to wrap the jars in pretty paper and tie with a bit of Christmas ribbon and send to each the thing I know he or she most likes.

I am going to have the family Christmas dinner. There will be 15 in all and I have something planned for every one. Instead of wrapping every package I am putting a card with the name on each gift and hiding them somewhere in the house, so after dinner we may have a jolly time finding them.

I have four boys and they have entered into this plan very heartily. We raised very nice pop corn and we are going to put it in pretty little bags made from some new material and tie with ribbon.

Last year when I received my Christmas packages I put away all the ribbon and stamps that were not soiled, and now I have them to use this year.

You can see what a pleasant time I am having being able to "shop" at home, for really it isn't very pleasant to try to shop down town with a baby and I believe my friends will be just as pleased over these little simple gifts, for I have made or prepared every one myself and lots of love is woven into them.

Just try this plan and see what a happy heart you will have and send some gift to some one who isn't look-

ing for one or whom you think will not be remembered by many. After all it isn't really what we give but the way we give.

Let us all remember that it is the Saviour's birthday that we celebrate, and render thanks unto Him for all the good things we have enjoyed this past year. Wishing you all a Happy Christmas.

CHRISTMAS CANDIES

Written for California Cultivator
By Nita Ferris, Woodlake

One woman who has a large list of acquaintances remembers them all every Christmas with a holly ribbon tied box of home made candies, delicious sorts made by herself. She buys a lot of fancy boxes of all kinds and then starts in to fill them with her candies, and these boxes of confectionery are looked eagerly forward to each year by the recipients. "It's easy to make fancy candies," she said recently, "if one only learns first the art of making fondant, the foundation of all cream candies. I make mine by putting two cups of granulated sugar and a pinch of cream of tartar into a kettle which cooks evenly all over the bottom, and then pour over this one-half cup of water. This syrup must boil without being stirred until it will form a soft ball when dropped into ice water.

"When it has reached this point I turn it out on a large platter or, better still, a marble slab (I have the top of an old marble topped table) which has been slightly greased. Watch carefully and when it is cold enough to bear your fingers in it stir rapidly with a wooden spoon until a thick, creamy mass is formed; then dust the bread board with pulverized sugar, turn the fondant on this and knead the mass as you would bread until it is soft and smooth. It is best to let the fondant stand in a covered glass bowl for three or four hours before beginning to make your fancy candies, your chocolate creams, nut and coconut rolls."

Candied fruit added to the fondant makes delicious confections. Melt one cup of the fondant slightly over the fire and add to it a tablespoon each of finely cut citron, chopped almonds, candied cherries and half a teaspoon of vanilla. Put this into a pan and add a weight to press into shape. Let it stand 24 hours and cut into squares.

Cocoanut balls are made by rubbing into the fondant as much shredded cocoanut as it will hold. If desired it may be dipped into melted chocolate. It is best to use the bitter chocolate, and when dipping fondant balls, or ovals, as you may have shaped them, use a knitting needle inserted into one end, as they will then be dipped evenly. The best chocolate drops are made by rolling an almond nut in a small ball of the fondant and dipping into the chocolate.

Another fine candy is made by taking small balls of the fondant flavored with vanilla and filled with chopped cherries and rolling them in maple fondant, melting slightly.

This maple fondant can be made in the same way as the white fondant by using two cups of brown sugar, one cup of maple syrup, one cup of hot water, a pinch of cream of tartar. The only difference in the process being that maple fondant requires longer beating to make it creamy. All sorts of flavoring may be added to the white fondant, rose, peppermint, lemon, almond, etc.

If one does not care to make fondant there are other Christmas candies made easily and quickly. Panoche is nice and is made by stirring one pound of brown sugar and one half cup of cream until it boils and forms a soft ball when dropped in cold water. As you take it from the fire drop into it a pint of pecan nuts, stirring until the sugar is granulated.

Nuts coated with syrup are made by boiling a cup of sugar and a quarter of a cup of water until brittle when dropped in water. Flavor with lemon or vanilla. Heat walnuts, almonds, pecans or peanuts—but do not brown—and dip them quickly into the heated sugar by means of a darning needle.

Nut and fruit confections are made by chopping half a pound each of dates and preserved cherries, a pound each of figs and English walnut meats, mixing thoroughly and rolling

the mixture into a thin sheet on the bread board, covering the board first with pulverized sugar. Cut out with a small cutter and roll in sugar.

Candied violets and rose leaf petals are easy to make and delicious, as everyone knows. Large raisins seeded and filled with blanched almonds, English walnuts and candied cherries and then the stuffed raisin put into another seeded raisin are tempting. Dates may also be treated in the same way.

One thing more should be added and that is that when you are making white or maple fondant be sure when the boiling process is on that the crystals which form on the side of the kettle are wiped off with a sponge or soft cloth, for if they fall back into the boiling syrup they cause granulation and spoil the candy.

A WOODSY CHRISTMAS BOX

The most attractive Christmas display I have seen this season is in the window of a great storeroom which has stood empty for many months. During this holiday season it is occupied by a firm which supplies Christmas greenery to the big stores. Back as far as you can see the room is heaped with fir and redwood boughs, with tubs of our California holly, and pine cones, big, little and middle sized. Oh, the smell of the fir and the pines! It is wafted out of the open door to the electric car as I pass morning and evening. Last night I walked blocks and blocks just to stand in front of that store and sniff!

Isn't there a hint here, for Christmas boxes, to those who are lucky enough to live near the hills or mountains?

THE CHRISTMAS DINNER

Written for California Cultivator

Tiny Christmas trees decorated with baby candles and tinsel are the most charming of Christmas table centerpieces. If a branch of a real tree is not obtainable a very satisfactory tree—of paper—may be found at the ten cent store. These come set in a spool-shaped standard with red berry-tipped boughs and may be decorated with bits of tinsel, odds and ends of bright, left-over ribbons from last Christmas, bits of cotton batting, etc.

Last year I used these very extensively in my gift giving. One of these tiny trees was placed in a five or ten-cent basket and the basket filled with fruit, nuts and candy. Some of the baskets were large enough to hold two to four glasses of jelly and around these were heaped the nuts and candy. The dressing of the trees and the filling of the baskets brought a delightfully Christmasy feeling, and the recipients, I know enjoyed them as much. The little baskets with their goodies under the glamor of the Christmas tree served as centerpieces on the various tables through the holiday week.

For a long Christmas dinner table—and that is the kind we all want at Christmas—three of these tiny trees might be placed down the center. If greens are laid beneath them the candles may be lighted when dessert is brought in and the housewife feel no fear of the dropping wax on her best tablecloth.

Here is a suggestion for a decoration, easy to make, that will delight the children, young and old: An attractive table decoration for Christmas morning may be made by covering small vanilla wafers thickly with boiled icing and in the center of each stand an animal cracker upright.

THE HOUSEHOLD CONTESTS

The prize winner this month is W. M. T., who does not wish her name to appear. We wish her modesty had not prevented us from publishing her solution of the Christmas problem under her own name, for surely she has solved it in a charming, practical and most Christmasy spirit, and the article in which she tells of her Christmas work is one to be proud of.

The second prize goes to Nita Ferris of Woodlake who tells how one woman makes her friends happy with pretty boxes of candy of her own manufacture. With this suggestion

HAY

Under date of December 11, Scott, Magner & Miller say:
The receipts of hay for the past week were 2423 tons, a trifle less than the preceding week, 2861 tons.

The market continues in about the same condition. The receipts being moderate. The market has a firm undertone which is especially evident in fancy grades of wheat or red oat hay. These two commodities are selling "to arrive" at top quotations.

From snap tallies taken by various dealers of the amount of stock available it is generally conceded that there is probably sufficient to carry through to the new crop, though large quantities are being consumed in the interior for feed purposes at this time. As a consequence, we look for a firm market throughout the

spring months.
Interior trade continues good and the export trade presents a normal appearance. Trade with the south continues as heretofore and now that the race track has opened at Tia Juana we look for larger shipments in that direction.
Demand for alfalfa is exceedingly good. There is no change in straw.
We quote the average wholesale prices for hay in carload lots on today's market as follows:

Citrus Fruit Market

LOS ANGELES, Dec. 15, 1915.

The orange market is holding up in remarkably fine condition and all the fruit offered is being taken, prices ranging around \$3.00 delivered. Central California has shipped more than 60 per cent of her crop and it is thought January 1 will see practically all of the navels cleaned up. Present indications are that earlier estimates as to output were perhaps 15 per cent too high. Lemon market still remains firm.

Shipments

Shipments of oranges from Southern California to date since November 1, 1915, 878 cars, lemons 557, total 1435. Last year same date, oranges 684 cars, lemons 410, total 1094. From Central California this season; oranges 2368 cars, lemons 50, total 2438. Same date last season; oranges 3053, lemons 74, total 3127. From Northern California this year oranges 375. Last year same date 397.

NEW YORK, Dec. 13.—Twelve cars navels, one car Arizona navels and five cars California lemons sold. Lower account heavy offering of navels; firm on lemons. Raining.

HOUSEHOLD CONTESTS

Continued from Page 605

she gives careful instructions as to how to make many different candies.

January Contest

We have received request that soups be made the subject of the next recipe contest in January.

For the best will be given \$2.00 in cash; for second best \$1.00. All published will receive three months' extension of subscription to the Cultivator if such extension has not already been granted this year.

With your recipe send name of member of your family now subscribing that the extension may be properly credited, or of course a new subscription may be started. Please write on one side of paper only.

All manuscript should be mailed to Household Department, California Cultivator, Los Angeles, and should be in this office by the morning of Thursday, January 13. The recipes will appear in the issue of January 20. With your recipe we will be glad to have you send suggestions for future contests.

SOIL TESTING MACHINE AT LAST

A little device of interest to every farmer or agriculturist has been invented by Dr. M. O. Reiche, a graduate of the Dresden and Munich, Germany, agricultural colleges, and until recently assistant director of the agricultural experiment station at Munich, Germany. Dr. Reiche calls it the "Standard" Soil Tester, because the testing of the soil is all done by one standard, viz., 20 grams. By using the "Standard" Soil Tester it is claimed that one is able to determine whether soils are acid or not, and to what degree; to ascertain the carbonate contents available in the soil to a close percentage, and to distinguish whether the disclosure is of lime or of black alkali; also to determine the amount of humus in the soil.

When the amount of lime or humus, if any, in the soil is established, it gives the assurance whether the soil is in fertile, workable condition or not, and whether it is acceptable to develop further fertility by the addition of fertilizers of different kinds, based on the character of crops to be raised. Unless soils have a sufficient amount of lime and humus, they are not able to properly assimilate the fertilizer and money spent for fertilizer, without a knowledge of the lime and humus available in the soil, may be spent uselessly.

Although it has been on the market less than a year, it is reported that many agricultural schools are already using the "Standard" Soil Tester in their demonstrations to pupils and in their laboratories and in every test the "Standard" Soil Tester has been found very satisfactory.

As the expense of testing the soil with this machine is merely nominal, being only a small fraction of a cent a test, its introduction will be watched with interest, by every rancher.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

Homestead Right

If a man files on a piece of land and in three or four months decides he does not want it and sends it back to the government has that man lost his homestead right?—Subscriber, Anaheim.

Under the recent act, as heretofore appearing in this column, he is entitled to take up other land under the homestead act.

Mortgages

I have a \$1000 mortgage on a house and lot, on which I have received no interest for a year. Can I give the party another year's time to pay so as to give him a chance to sell before I foreclose, or would that outlaw the debt? If I can, must a paper be made out to that effect? Also, another investment, the papers are in a trust compny's hands, no interest having been paid. What is it liable to cost me to foreclose? I have not much money and it worries me. About what will a lawyer charge me?—Subscriber, San Diego.

Statute of limitation upon notes made within this state is four years from the date on which the payment is due, so that you would be entirely safe in allowing an extension of one year. Upon trust deeds the fees of the trust company are usually graduated with reference to the amount due under the trust deed. In order to find out the cost you should write to the trust company holding the deed. It is very frequently the case that parties give deeds upon a small payment and clear the obligation up in that manner. There will be no attorney's fees upon the foreclosure of the deed, the entire matter being attended to by the trust company, and the amount which you paid would be added to the amount due under the trust deed and upon the sale of the trust deed the net amount received or for which the property was bid in is credited against the note and you are then entitled to bring suit against the maker of the note for the balance due thereunder.

Agent's Liability

A is working on a salary for a manufacturing company. He travels and appoints local agents. If A follows instructions from the company in making contracts with all local agents can B, an agent appointed by

A, hold A for damages or for salary, or hold A liable in any way, in case of a breach of contract by the company in their dealings with B? Would a showing of good faith on A's part have any bearing on the case?—Subscriber.

An agent who makes a contract as an agent incurs no personal liability, but in the usual case it is just as though the principal himself was present and signed, so that the agent in this instance would very probably have no obligation.

Collecting Wages

One year ago a housekeeper was engaged at \$50 per month. Four months later she was discharged. The employer has never paid any wages although she has promised to do so from time to time. What steps should the employe take to collect her wages? Is she entitled to wages for the time since her discharge until she is paid in full?—Subscriber, Nestor.

A housekeeper is entitled to bring action against the employer for the term she worked that has not been paid. Unless there was a contract for work for a definite period of time and the employer has broken said contract without fault upon the part of the employe the employe could recover no larger amount than for the actual time for which she was employed.

Yerxa's PRUNE TREES

We are making a specialty of Prune and Plum trees budded on Myrobolan roots imported by ourselves from France. Buds selected from the heavy bearing trees in our own orchard.

Prices on application.

General Agent, 1014 First Savings Bank Bldg., Oakland, Cal.

Walnuts Brief History of Concord and Wiltz (San Jose, Mayette)

Concord originated as a seedling of a tree imported by Felix Gillet. The Leonard Coates Nursery Co. obtained grafting wood of Eli I. Hutchinson of Concord; propagated and disseminated it solely for six years, after naming it "Concord". This variety is now acknowledged to be one of the best, one crop having been sold for 24 cents a pound to the Walnut Growers' Association. Wiltz is also a seedling of a tree imported by Gillet, and propagated first by Mr. Wiltz. The Leonard Coates Nursery Co. also first placed this variety on the market, propagating it solely for some years by arrangements made with Mr. Wiltz, and have their own bearing orchard of trees propagated by Mr. Wiltz, himself.

We have both budded and grafted trees of these varieties, the Vrooman, Franquette, and others. Eureka should be further tested before planting largely; it blighted badly this year.

Our Prices Are Right Our Stock Is Right

OUR "COATES" FRENCH PRUNE HAS PROVED A WINNER.

Landscape Gardening a specialty. Will furnish plans and estimates for any ornamental planting.

Write us for further information. Remember we have the stock and we grow it ourselves.

Bean Giant Power Sprayer

The Power Sprayer for Large Orchards

For downright dependability—efficient work—high pressure—ease and economy of operation—low cost of maintenance—strength—durability—and all round satisfaction the Bean Giant is in a class by itself. Supplies 2 to 4 lines of hose and has a capacity of 7 to 12 gallons a minute. Good for 4 to 8 acres a day.

Thirty years' experience in the building of spray pumps is back of this outfit.

Built Complete Under One Roof

Every part is produced right here in the Bean factory—with the exception of the Novo engine and the Novo is used because a better sprayer engine can't be built. TWENTY-ONE DISTINCTIVE FEATURES are incorporated into the making of the Bean Giant—Patented Pressure Regulator, Porcelain-lined Cylinders, Rustless Ball Valves, Bean Patented Refiller, Truck with Rocking Bolster, One-piece Steel Frame, and many others.

We handle a complete line of smaller power sprayers and hand pumps. Before you invest in any kind of a Sprayer

WRITE FOR NEW CATALOG

We have just issued a complete new catalog showing our entire line of hand and power sprayers, including several new outfits and many new 1916 improvements. This book ought to be in the hands of every fruit grower. A postcard will bring it.

Christmas Carol

By Phillips Brooks

Everywhere, everywhere, Christmas tonight!
Christmas in lands of the fir tree and pine,
Christmas in lands of the palm tree and vine;
Christmas where snow-peaks stand solemn and white,
Christmas where corn-fields lie sunny and bright;
Everywhere, everywhere, Christmas tonight!

Everywhere, everywhere, Christmas tonight!
Christmas where children are hopeful and gay,
Christmas where old men are patient and gray;
Christmas where peace, like a dove in its flight,
Broods o'er brave men in the thick of the fight;
Everywhere, everywhere, Christmas tonight!

A Merry Christmas to Each and All

Experience is an

all important factor in the manufacture of Orchard Sprays. When experience is combined with the best obtainable materials and a thorough knowledge of the proper proportions which are most effective in controlling orchard pests, the result is Orchard Brand Spray Material.

ORCHARD BRAND Lime Sulphur Solution, Atomic Sulphur and Bordeaux Mixture are uniform and of proper consistency, dependable in quality and give results.

Crude Oil Emulsion and Miscible Oil are especially prepared for killing scale insects and aphids eggs.

ORCHARD BRAND Arsenate of Lead Paste is a standard poison for killing chewing insects.

When writing our Free Information Bureau, give the age, number and kind of trees and describe fully the pest which you wish to control.

State quantity and kind of material when ordering.

One Dollar Yearly

Pruning Deciduous Fruit Trees

Written for California Cultivator by Leonard Coates

NO doubt the theory and practice of pruning were as well understood in the days of Pliny as now. Treatises on the subject written 2000 years or more ago are in existence and are occasionally quoted from by modern writers. It is true that much advice was given which had its source

These consist of hand pruning shears of the best make. Cheap shears should be avoided. A saw of the curved French or "Californian" pattern is needed and a good pruning knife. A ladder about eight feet is a convenient height, of which there are several good patterns on the market, is easily moved, and is a necessary adjunct to the outfit. A wet-

face moisture, or when they reach rock a few feet down and are forced to grow horizontally rather than vertically. A cultivated fruit tree is no exception, and thus allowed to grow, its form is the most symmetrical and beautiful. One school of pomologists still favors this plan, making it a rule never to cut or interfere with the "leader", shortening in the side

chiefly a hot, dry summer, conducing to the bearing of regular, heavy crops. This has not been adhered to as closely as it might, but undoubtedly should be the universal system for all deciduous fruit trees in this state.

To Start Right

The one-year-old trees when planted

solely in ignorance and superstition, and we cannot boast even in this enlightened age of having rid ourselves of all of it. Volumes, one might almost say whole libraries, have been compiled on pruning fruit trees, and the subject has been exhausted, so that whatever may now be said is simply the presentation of old ideas in new form.

We all know the object of pruning to be the increased production of good fruit so far as is compatible with the health and longevity of the tree.

The Man

The quality most lacking and yet most essential in a good pruner is imagination. No one can properly shape a tree unless he can see it mentally as it will be next year, or any of the years following, if a certain system of pruning be followed. Second in importance is the faculty of observation which becomes very acute if trained by use. No two trees are exactly alike, and while good pruning is done according to principle, each will require some little variation in treatment.

Combine these two, imagination and observation, with a love for, or keen interest in, the work and the trees are likely to receive very good care at the

hands of such an operator and to respond in proportion by being healthier and more productive.

The Tools

Let the man be perfect, and without good tools he is badly handicapped.

THE BANKER'S OPPORTUNITY

R. V. Holland

NE of this country's largest bankers made the statement not long ago that "the small town banker is in position to render his community a most valuable service if he will recognize and take advantage of the opportunity by doing his full part in community welfare work".

His statement elicited an expression from one of our small town bankers to the effect that a large majority of small town banks really do more to retard community welfare and development than they do to promote them. A most lamentable condition even if only partially correct as stated.

The president of one of our banks in a town of some 10,000 population stated to the writer a few weeks ago that fully 80 per cent of their loans netted them a minimum interest of 15 per cent per annum.

In reply to my question as to how they get around the usury laws, he replied: "There are many roads to London".

He then went on to explain that many of their loans are small, short time accommodations, and that the bank cannot handle them at regular interest rates without sustaining a loss in practically every instance.

While I realize that there are many bankers pursuing such methods as these, it is safe to say that a majority of them are beginning to appreciate the fact that the growth of their business is dependent upon and limited to the growth of their respective communities, that if they adhere to methods and practices tending to injure or retard local progress they must in turn suffer along with the rest of the community.

Many bankers consider their banks institutions for community service and conduct them accordingly. A splendid example of this class came to my attention a few days ago in the shape of one of our small town bank presidents. During our conversation he expressed views and convictions regarding the banking business which a few years ago would have been considered business anarchy.

When asked as to his ideas concerning a bank's duties and its obligation to the community he said: "Inasmuch as we are the largest corporation in our town we feel it our duty to take the lead in every movement for the good of the locality. We are the largest subscribers to the local chamber of commerce, civic improvement funds, etc., and never fail to have the bank represented in every local improvement campaign. We also make it a rule to take as much or more advertising space in our local papers than any one else in the town."

He further stated that "when a small borrower needs from ten to thirty dollars for a short time we charge him the same rate per cent per annum on his loan that we would if he borrowed \$25,000 or more. We treat the small customer as liberally as the large one, thus making him feel that no advantage is being taken of him because he is poor. He will remember and appreciate this when he becomes a large customer."

This banker also takes deep interest in agricultural and live stock matters in his community, as a result of which practically every farmer and stock raiser is his patron. One of the merchants in his town stated that the bank was directly responsible for the success of the majority of their business institutions. The bank itself is a splendid success from every standpoint.

A few examples of this kind will undoubtedly bring about a radical change in small town banking methods. The opportunity is ripe for those who desire to take advantage of it, which many are already doing.

stone may also be carried in the pocket, but the shears should be honed every night, and, with the saw and knife, cleaned and oiled: the latter is needed for paring edges if a large limb has to be removed and for cutting out any gum which may be found.

The Work

The natural aspiration and inclination of a tree under normal conditions is for its top to grow upwards, in an upright position, seeking air and sunlight, and for its roots to go down, seeking moisture. Modifications occur, as when the central stem or leader is broken or the top crushed or bent with the weight of snow, and, with the roots, when there is ample sur-

branches only, as subsidiary or auxiliary thereto.

An objection to this method is that very careful and annual expert pruning is necessary in order to keep the tree in this position after it reaches bearing age, otherwise the branches will bear down with their load of fruit and expose the central stem to the sun, which in the California summer temperature is not desirable, sunscald being the invariable result. Another objection is the greater difficulty in picking the fruit.

Early in the pomological era of California it was found by some of our most practical growers that the goblet or vase form, or some modification of it, was better suited to our normal conditions, these conditions being

should be cut back to two feet from the ground, not to 16 inches, as is often advised. The pioneer growers erred in recommending that trees should be headed so low, as it did not allow of proper spacing of the branches which were to form the foundation for the future tree, but resulted in the branches all starting out at one point in a kind of whorl. This makes ugly crotches and a permanently weak spot, as well as a crowding or pinching in the base of these branches, often causing exudation of gum.

The illustrations show a French prune tree the second and third years, or the third and fourth, and may serve as a basis for other fruit trees. It is better to let alone the growth that is made the first year, and if this growth is but slight, cut it down to four or five inches so that there will be sufficient strong, upright shoots the next year to make the future head. Then the second year, or the third year as the case may be (depending upon the growth) select three or four of the best shoots, spaced apart at a uniform distance of about three or four inches. Cut out all other shoots, except small laterals which are shortened in annually to make future fruit spurs. These should

be cut back as indicated by, cross lines in Fig. 1; Fig. 1 showing the bushy growth that is made the second, or perhaps the third year. Fig. 3 shows the next summer's growth, and Fig. 4 illustrates the same tree

Have you this Book?

—if not, it will be our pleasure to mail you a free copy, *provided*, you will write us the number of Citrus trees and varieties you will require. Besides giving exact information on orange and lemon growing from seed to harvest, from packing house to market, it also describes

TEAGUE QUALITY CITRUS TREES

—giving the history, character of tree, and quality of fruit produced by the standard and ornamental varieties mentioned in the opposite panel. The book is sumptuously illustrated, thus affording a splendid object lesson of California's great citrus industry.

—for the past twenty-six years we have made the growing of citrus trees and the development and management of orange groves an exclusive business. This of itself insures quality in our nursery trees that no one contemplating planting an orchard can afford to neglect, particularly when we are offering stock at prices that are the lowest for the best trees that can be produced. Write us to-day.

LIFE IN THE SOIL

Address By Howard S. Reed Before
Lemon Men's Club of Southern
California

It is coming to be pretty generally understood by all thinking men that the future welfare of the race is indissolubly bound up with the productiveness of the soil. For the past ten years the prices of the necessities of life have continually increased owing to the increase of total and per capita consumption of commodities of this country. The recent utterances of men like Mr. J. J. Hill have been a clarion note to arouse the interest of the producers and consumers alike in the absolute dependence of the nation upon the ability of its soil to produce, not average but maximum yields from year to year. This is entirely possible because we have in our soils our one great, indestructible national asset. For my part I have no patience with those misguided croakers who continually lament that our soils are slowly but surely being depleted of their stores of plant food constituents and assure us that within the limits of the present century our vast domain will be fruitless and the soil will be "a burned out cinder".

Portions of the Atlantic coast states have been cultivated for upwards of 300 years and where not abused the soil is producing better crops today than ever before and compares favorably with the newer lands of the Mississippi Valley. For the ten years, 1899-1909, the average yield of corn per acre was the same in Virginia as in Kansas; the average yield of corn per acre in Massachusetts exceeds that of Illinois. Not only do I believe that these yields can be maintained for centuries but that they will be materially increased the country over.

Soils are now being studied as other realms of nature are studied. Up to the present time our knowledge of the plant far outweighed our knowledge of the soil because only within a short time has the soil problem come to be thought of as essentially dynamic. Until recently the assumption has been made more or less explicitly that the soil of a field remains fixed indefinitely. It has been assumed that the only important change taking place in the soil is a loss of mineral plant nutrients, partly by the leaching action of water and partly by the removal of garnered crops. In other words the soil has been regarded as a static, lifeless system. This is a fundamental error. We now know that there are extensive living agencies at work in the soil by means of which deep seated and fundamental changes are brought about.

Why this late development of soil science? Largely I believe on account of the work and writings of Baron von Liebig. Great as were the contributions of Liebig to many branches of chemistry he undoubtedly retarded work which would have revealed the truth years ago. During Liebig's lifetime men like De Candolle and Pasteur were revealing the important role which living organisms play in the constructive and destructive work of nature in the health and disease of the body. They met with incessant and bitter opposition from Liebig. Liebig's predilection was for chemistry, and he could see nothing in the world but chemistry. Unfortunately the fame derived from his real discoveries floated many an unseaworthy theory of the same mastermind. Such was the case in regard to his theory of mineral requirements of plants, which held that the fertility of a soil depended on the presence of certain mineral substances which are invariably found in the ashes of plants. Although the experience of the farmer has not confirmed the chemical analysis of the soil this view

of Liebig's has prevailed nearly to the present day.

With the dawn of the idea that there in life in the soil, a new phase of study was immediately opened, and although yet in its infancy many important results have been attained. On the side of the plant it has been shown how great an influence may be exerted by the growing root itself. The researches conducted by the bureau of soils laboratories of the United States department of agriculture have shown that the plant roots frequently leave noxious excretions in the soil which, while injurious to plants of that species, are harmless or even beneficial to the roots of another species. This idea had been advanced by De Candolle in 1832. This fact in itself throws needed light on the necessity for rotation of crops since soils may become unproductive, not for lack of any essential ingredients but because the previous excretions render them unsanitary for the continued growth of that crop. Researches conducted in the same laboratories have also shown that in certain soils toxic compounds may arise from the disintegration of plant remains under improper conditions of aeration or water supply, but where proper conditions exist the plant remains and manures disintegrate to form the beneficial classes of humus bodies.

On the part of the soil it may be shown how great are the extent and relations of microbial life in the soil and how powerfully they influence its productiveness.

Of all the varied activities of bacteria in nature none compares in importance with the work of the soil bacteria. They not only determine the fertility of the soil, but they serve as the connecting link between the world of the living and the world of the dead. They are the great scavenging agents which tear down the dead bodies of animals and plants and restore the carbon, nitrogen, sulphur and other elements of the tissues to the round of nature. The processes of nature are such that the same material is repeatedly used, passing in endless cycle from plant to plant or from plant to animal and back again to plant, but always with the intervention of bacteria. Without their action dead bodies would accumulate and cover the surface of the earth; the kingdom of the living would be replaced by the kingdom of the dead, and the world's supply of carbon and nitrogen would be locked up in a form useless to most forms of life.

A pile of finely powdered rock is not an agricultural soil because it contains no organic matter. In a good fertile soil the organic matter is present in the form popularly called humus. The presence of humus in the soil gives it that warm brown color which the farmer recognizes as characteristic of fertile soils. Humus represents a fairly permanent form into which the decayed plant and animal tissue have passed. A load of hay incorporated with the soil is not humus but may be converted into humus by the proper agencies, chief among which are the bacteria and fungi. In a warm, moist, well aerated soil the plant tissues are attacked by bacteria which break down the cellulose, starches, gums, sugar and protein. New compounds are formed, among which we may detect considerable amounts of carbon dioxide. The first steps in this decomposition are somewhat similar to the digestion of plants in the stomach of an animal. Following this process of disintegration the various components recombine and unite in ways as yet little understood into various substances of a semipermanent nature which we call humus, or humus bodies. In this stage the organic matter shows its beneficial properties. The soil is porous, freely admitting water and air, does not readily lose heat, becomes friable, is a congenial medium for plant growth.

Under the best conditions when the soil moisture is neither excessive nor deficient, soils allow the decay of the humus, but the rate of decay is quite slow. On a properly cultivated clay or clay loam the effects of manure may usually be noted several years after its effects have altogether vanished from sandy soils. For this reason soils consisting largely of clay are commonly known as strong soils. In case such soils are too compact to permit the most profitable rate of humus decomposition their texture is usually improved by cultural methods which result in increasing the growth of the proper bacteria, for example, by drainage or by application of lime.

While humus is extremely important both as a chemical and as a physical agent in soil improvement, its usefulness does not end there. Humus contains different chemical elements derived from former generations of plants, one of which is very essential for plant growth, namely, nitrogen. Humus nitrogen as such is of practically no use to green plants but must undergo transformation. One class of bacteria has labored to convert the plant tissues into humus. Subsequently another class of bacteria must bring about a decomposition of the humus and the formation of new nitrogenous compounds. This lengthy process is known as nitrification.

It is a curious thing that we owe the early studies of nitrification to the arts of war rather than the arts of peace. The long wars of the eighteenth and early nineteenth centuries were a severe drain upon the niter deposits. When England acquired India the other European nations were cut off from the principal niter deposits known at that time. Under the stimulus of necessity Napoleon directed the thought of the French toward the possibility of increasing the production of nitrates. Experiments showed that nitrates could be formed in a properly constructed compost heap containing animal and plant remains and that the interpolation of brush and straw, which promoted aeration, promoted the formation of nitrates.

In more recent years we have learned that the principal agents in the process of nitrification are the bacteria which such material contains. The first step and perhaps the most beneficial one is the formation of ammonia from the nitrogenous compounds in the soil humus. This process may go more or less simultaneously with the destruction of the cellulose of the plant tissue. While this process is going on another class of bacteria convert the ammonia into nitrites. Nitrites are not suitable for the nourishment of green plants; in fact they are more or less poisonous. However these compounds do not remain long in the soil because they are soon acted upon by a third class of bacteria which acts upon the nitrites and transforms them into nitrates. These last two classes of bacteria work in wonderful unison, transforming the nitrites into nitrates almost as fast as they are formed. The sum total of the activities of the third class of the bacteria results therefore in the formation of nitrate nitrogen in the soil, which is a suitable form of nitrogen for the nourishment of most green plants.

Since this process is chiefly bacterial in its nature it follows that conditions favorable to bacterial activity are also favorable to nitrification. If the soil is too dense to permit the access of sufficient air or too wet, this process does not go on properly. On the other hand other classes of bacteria may act upon the organic nitrogen, producing from it substances detrimental to plant growth. Such instances are seen in swamps where only plants having a highly resistant constitution are able to survive.

It will be noticed that these processes do not increase the amount of nitrogen suitable for growing crops. The question still remains, "Whence came the world's supply of combined nitrogen?"

When rock layers disintegrate to form soil they ordinarily produce a soil which contains all of the ordinary elements required for plant food except compounds of nitrogen, for of this latter class most rocks contain none. Yet when productive soils are analyzed, for example, the so-called

virgin soils, they are found to contain large quantities of nitrogenous material, as much as 5000 to 10,000 pounds per acre, to a depth of one foot. Chemists are unanimously agreed that all of this nitrogen has been derived in some way from the large store of gaseous nitrogen in the air and that the major part of it has been accumulated through bacterial action.

We owe to many hands the works which lead up to the discovery by Hellriegel and Wilfarth of the nitrogen gathering bacteria associated with leguminous plants. The facts which they brought to light have shown the farmers how to maintain indefinitely the supply of valuable nitrogen in cultivated soils. Considering its importance to the human race it is almost impossible to dwell too strongly upon this process of nitrogen fixation. Without it life as at present organized could not exist upon the earth today.

Certain varieties of these bacteria find an habitation in the roots of leguminous plants and produce there-

on swollen nodules. While their host plant lives the bacteria use atmospheric nitrogen to build up a store of nitrogenous compounds, part of which go to nourish the host plant during its life, but much is left in the root and is added to the soil upon its death and decay. Thus through the benign activities of these bacteria soil wealth is created from an inert worthless gas in the atmosphere.

It has been frequently proven that the legume nodules are not produced in the absence of the specific bacteria and hence the fixation of nitrogen does not go on. If the suitable bacteria are present in the soil they enter into intimate association with the roots of the leguminous plants and form the characteristic nodules. The plants obtain in this way a suitable supply of nitrogenous material and the bacteria likewise are benefited by obtaining a suitable supply of carbohydrate from the tissues of the host plant. The bacteria enter the fine root hairs and partly by migration and partly by growth strands

progress into the cells of the outer layer of the root. The more virulent strains of bacteria produce more and larger nodules than the weaker strains. In the nodules many of the bacteria grow in typical peculiar forms as a result, no doubt, of the presence of organic compounds peculiar to that plant. For example, the bacteria of the alfalfa nodule when grown in pure cultures are in the form of short rods, but in the nodule the same variety of bacteria is found in the form of x and y shaped organisms.

To Be Continued

Orange growers of Riverside, San Bernardino and Orange Counties are organizing clubs, the object of which is to send a protectionist to congress from the 11th district. Lemon men have been seriously injured by Mediterranean fruits and it is proposed that as politics was used to deprive the lemon of protection the same means now be used to secure its return.

Show us the hill this Car can't climb

Or show us the hill that you **THINK** it can't climb—and we'll give you the best demonstration of hill-climbing that you ever witnessed.

This Studebaker 4-cylinder car is the **MOST POWERFUL** car on the market at its price. With its motor **INCREASED** from 3½ x 5 to 3⅞-inch bore x 5-inch stroke, it develops and delivers **FORTY Horse Power**. And it is the **ONLY 7-passenger, 4-cylinder car** with a 3⅞ x 5, **FORTY Horse Power** motor that has ever been offered in America or Europe at less than \$1,000.

Owing to the high location of the carburetor, the 6-inch intake and the scientific design of the gas passages, it is the snappiest, most flexible 4-cylinder motor that you ever drove. In **POWER** and flexibility it equals most Sixes on the market.

But **POWER** alone is not the only reason that it stands supreme in the 4-cylinder market. Studebaker has set a new standard of **VALUE** for Fours. For while the price has been reduced from \$985 to \$885, nothing but the price has been decreased. In **POWER**, size and quality the car has been greatly **INCREASED**. And wherever materials were changed, **BETTER** materials were used, as for example, in the upholstery which is the finest, hand-buffed, semi-glazed leather.

From any angle—**POWER**, hill-climbing, performance on the roads, size, riding-comforts or quality—this Studebaker **FOUR** stands in a class of its own—the **GREAT** value of the year. And knowing what that name of Studebaker stands for—knowing the long years that Studebaker has studied the farmer's transportation problems, certainly you can not safely invest one dollar in a car until you know this latest and best Studebaker. See it at your dealer's—and write for 1916 Catalog at once!

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.

BEAN MEN ORGANIZING

The central committee having
in charge the organization of the lima
bean growers of the state is pushing
preliminary arrangements with a
vigor which should insure a strong
organization. Orange County grow-
ers are also agitating organization,
and we doubt not will join most
heartily with the Ventura growers.

FRUIT INSPECTION PAYS

Fresno County's horticultural
commissioner has handed in his re-
port as to the season's operations in
inspection of green fruit. This in-
spection has cost the county \$3268,
and it is estimated that the returns
to the county because of the standard-
ized fruit shipped and the better
reputation for dependable goods will
amount to many times more.

RUSTLERS BEWARE

Cattle men of Tulare County
have organized a protective associa-
tion and to the end that protection
may protect, they are planning to
offer a reward of \$1000 for the arrest
and conviction of anyone stealing cat-
tle from a member. This should in-
duce some rustling on the part of
amateur detectives up that way and
reduce the amount of rustling on the
part of the cattle thieves.

IMPERIAL PROBLEMS

Probably no farming section in
the world ever offered more perplex-
ing problems than does the Imperial
Valley. Its dozens of years' experi-
ence have availed much, the state ex-
periment station under direction of
Mr. Packard is solving many prob-
lems and the United States depart-
ment of agriculture is aiding with
marketing and other specialists. Last
Saturday there was held at Brawley

an institute or school unique and we
believe most helpful. Mass sessions
were held, also at times the meeting
was broken up into sections and each
attended the one where his own spe-
cialty was being discussed.

Many of the speakers were practi-
cal home people while others, equally
as practical, came from the state uni-
versity to aid in the work.

GET-RICH-QUICK SETTLERS

The Weekly Letter of the Ari-
zona experiment station shows that
Arizona has a problem which is simi-
lar to that of California and we sup-
pose of all other states where there
are human beings. The letter says:
"One of the greatest handicaps to
rapid progress in the development of
Arizona's agricultural resources is
the large number of want-to-get-
rich-quick settlers who have come
to take up land in the state. They
have been lured here by the at-
tractive advertising which has been
sent out and have come with
the idea that they can secure gov-
ernment land for practically nothing
and soon sell out at a big increase
in price without having invested
much money and without having done
much hard work. These speculators,
or "land grabbers," as they might be
called, are proving a serious obstacle
to the development of many Arizona
communities, and in several instances
the local farmers' organizations have
been discussing ways and means of
ridding the state of these objection-
able settlers."

BEAUTIFUL WEATHER

"Beautiful weather, thank you".
Everybody tap on wood while we re-
mark that this is an exceptionally
fine season. The orange grower has
been sitting a bit near the edge of his
chair ready to spring into action if it
became any cooler. In fact, in a very
few cases there have been smudge
pots lighted "in the next county", but
even where this has not been done
we believe there has been no injury
whatever to citrus fruit. Another
two weeks and we will have passed
the danger point unless a streak of
that exceptional weather which some-
times does appear in California is
given entirely out of season. We be-
lieve there was never a time when
the orchardists were so fully pre-
pared for the coming of Jack Frost
as they are this year, and the cool
weather has been merely sufficient
to give a good lively fuel trial which
will prove of value if the need does
come.

As to rain there has been sufficient
to start nearly every plow in the
state.

STAND BY HIM

Harris Weinstock, market di-
rector of California, is sending out a
letter "To the people of California"
asking that support may be given
him in the big task which confronts
him. After outlining the work he
hopes to do he closes with:

"And now, as I go to the task
assigned me, I shall give to it the
best that is in me. All that the years
of my business training have taught
me, all that I have learned in many
kinds of public service, and all of the
ideals which have guided me in both
private and public life, are hereby
dedicated to this service. All that I
ask in return is some small recogni-
tion of the simple fact that I am try-
ing to render an exceptionally diffi-
cult service and that I shall need the

forbearance and the support of all
producers, distributors and consum-
ers who realize what the success of
this new state commission market
can be made to mean to the entire
state."

Outside the sympathetic appeal in
the above and simply as a matter of
selfishness, we wish to assure Mr.
Weinstock we're his to command, and
in response to one sentence in his let-
ter, "I think you will agree with me
that this is, in the language of the
Greek poet 'some job' we can only
say, "Mr. Weinstock, you're some
man."

PRUNING

These long evenings give oppor-
tunity for the orchardist to study up
on the question of pruning. Nearly
every orchardist has his own theories,
unfortunately many of them wrong,
and the rest of us, who sometimes
know less of the conditions of his
orchard than he does, try to help him
with suggestions. The fact is that
every orchard and every tree can be
intelligently pruned only when—like
human beings—it is understood. The
man who lives with his orchard soon
learns to understand its needs from
its habits. However, there are some
general principles of pruning which
we all must understand if we would
have our trees live up to their best
and produce quality and quantity. As
a help in that direction we have in
the present issue an article on this
subject by Mr. Leonard Coates, who
has had wide experience in the prun-
ing of all kinds of deciduous trees.

PROFIT IN QUALITY

At the beginning of this citrus
season there was a determination on
the part of shippers to make it a sea-
son of quality, to see that all fruit
shipped qualified under the eight to
one maturity test recommended by
the department of agriculture. This
delayed the early shipments, and
until a few days ago the quantity was
falling behind that of preceding
years. The last two weeks' ship-
ments however have exceeded the
same two weeks of any previous year
in the history of citrus shipments,
and still better, the price from the
very first has been higher than any
preceding year for the same week.
Bear in mind this is not for particu-
lar weeks but for every week since
the shipments began. Color of fruit
has not been used as an index to qual-
ity or to ripeness, but only the chemi-
cal standard.

One result of this campaign for
high quality may be mentioned. It is
that in the Eastern markets the daily
average price has been higher than
last year's high price. This is not men-
tioned to glory in the fact that Cali-
fornia is topping Florida, but it is a
good point to call to the attention
of those of our readers who have been
restive under this year's restrictions.
When a man has found his fruit
showing good color and considers the
prices secured for exceptionally early
fruit in former years and the further
fact that the cold may come and
lower the quality of his fruit he is
naturally very anxious to unload, but
the interests of all the state are far
above the interests of one man or of
one community, and returns are now
showing that while the very earliest
prices were not abnormal the aver-
ages up to this time are by far the
best of any preceding year. The sea-
son looks most promising and we
trust the sections which will begin
marketing fruit soon after the first
of January will maintain the same
high standard set by the earlier sec-
tions.

Agricultural Notes

Owing to shortage of wheat the
Spanish government has authorized
free admission of wheat, exempt from
transportation tax as well as import
duty.

Germany was our largest customer
for dried apples during the five-year
period, 1910-1914, taking a full half
of our export. Holland took over
one-fourth.

New South Wales, Australia, will
have citrus fruits to export this year.
The coming crop, oranges, lemons and
mandarins, is now estimated at 125,-
000,000 bushels.

More than two-thirds of the apple
crop of Nova Scotia this season was
packed and marketed by the United
Fruit Companies of Nova Scotia, a co-
operative organization.

Fifty schools in agriculture and fif-
teen schools in home economics will
be held by the extension department
of the Michigan Agricultural College
in that state this season.

Whale guano is being used exten-
sively by South American farmers.
According to the British and South
African Export Gazette, it is sold by
the government at \$31.60 per ton
f. o. r.

A plant for manufacturing citrus
juices has been established at Lake-
land, Florida. The plan is to use cull
grapefruit and oranges. The peelings
also will be used in preparing oils and
extracts.

The New Zealand government has
imposed a war tax of one-half penny
(one cent) additional on every piece
of mail (except newspapers) posted,
save in case of mail under the postal
union rate now paying five cents.

The annual value of the food used
on nearly a thousand farms in the
United States, surveyed by the de-
partment of agriculture was found
to average \$448 per family, of which
58 per cent was furnished by the
farm.

Minnesota has a state fruit breed-
ing farm established some six years
ago. The principal work of the farm
has been to secure a hardy apple that
will bear the most delicious fruit ca-
pable of keeping sound for a long
time.

According to Die Deutsche Zucker-
industrie the German military authori-
ties in Belgium have issued a decree
prohibiting under penalty of the law
the use of any sugar beets for cattle
food in that country. Offenders will
be fined 20,000 francs (\$4,000) or five
years' imprisonment.

California and Michigan produce
75 per cent of the domestic beans
consumed in the United States, and
the production in California is rapid-
ly increasing. Almost every variety
of beans, from small whites to limas,
are grown in this state and the acre-
age this year is estimated to be 25 per
cent greater than that of 1914. Heavy
purchases have been made for use by
the armies of Europe.

The outlet for dairy products of the
United States has increased appreci-
ably in the last year through export
demand. Butter exports have in-
creased from about 3,500,000 pounds,
the usual amount exported annually
before the war, to 10,000,000 pounds
during the fiscal year of 1915; at the
same time imports of butter have de-
creased from about 8,000,000 pounds
to about 4,000,000 pounds. On the
same basis exports of cheese have ad-
vanced from 2,500,000 pounds to 54,-
000,000 pounds.

Agricultural News Notes

of the Pacific Coast

Northern California

The orange crop of Butte County is practically all picked.

Northern California reports half of its Navel crop now in the Eastern market.

Two thousand acres will be planted to grain on the Natomas Consolidated holdings.

Many cattle have been reported killed by coyotes in Modoc and Lassen Counties.

Gangs of men are busy tearing down the beautiful exposition buildings at San Francisco.

The Forest Hill local of the Placer County farm bureau will hold a meeting December 30.

Plantings of Waterbune rice on the Phelan ranch west of Chico ran 51 sacks to the acre.

The department of agriculture has set aside \$1000 to pay laborers who will poison coyotes in Modoc County.

Ten thousand dollars' worth of Orland almonds were sold last week. This is practically 90 per cent of the Orland output.

Directors of the Sacramento Valley exposition commission have decided not to exhibit at the San Diego exposition for 1916.

The California Ripe Olive Association has planned to buy supplies for members cooperatively. The first purchases have been of fertilizers.

The third annual convention of the Inland Waterways Association of California will be held at the Palace Hotel, San Francisco, February 21-23.

A large planting of pear trees is being made in the section about Chicago Park in Nevada County. The tree holes are being dug with dynamite.

The university farm shipped to the livestock show at Portland 15 head of prize cattle and 15 head of sheeep. All were winners at the exposition last month.

The first prize for exhibit of varieties of pears at the Panama-Pacific was awarded to the Loma Rica Nursery of Grass Valley. This nursery exhibited 48 varieties.

The Sebastopol Agricultural Club was addressed by Assistant State Horticultural Commissioner Weldon at its last Saturday's meeting. Mr. Weldon gave a lecture and demonstration on pruning.

Central California

Olive pickling has started in the Tulare cannery.

Lindsay, Tulare County, received 1.30 inches of rain during the last rain storm.

Garlic raisers of Monterey County have been receiving from ten to 15 cents a pound.

Melon growers of Le Grande, Merced County, have organized a marketing association.

Many poultrymen from all over the state exhibited birds at the show held last week in Porterville.

A swine raisers meeting was held at Poplar, Tulare County, last Friday. Speakers from the state university were present.

More than 400 tons of dried peaches belonging to Selma growers will be pooled. The growers expect to realize better than five cents.

Modesto wants the next state poultry show. The Stanislaus Poultry and Pet Stock Association will put forth its best efforts to get it.

A mass meeting of potato growers of the Salinas Valley was held yesterday. Other meetings will be held in the county in the near future.

The San Joaquin Valley Counties' Association will direct its activities next year toward securing a wider market for produce of the valley.

All citrus packing houses in the Porterville district are working with day and night and crews to pick the fruit and get it off to the Eastern markets.

The state authorities have just completed planting 2500 soft shell clams in Morro Bay, north of San Luis Obispo. Only 25 clams may be taken by one person in a day.

Hames Valley in the southern part of Monterey County is developing into a turkey raising district. Heavy shipments will be made to San Francisco for the Christmas trade.

County Bee Inspector Henneken of Monterey County, after a tour of inspection, reports apiaries in prime condition. He estimates this year's honey crop of the county at 250 tons.

The California Associated Raisin Company is one of the four biggest taxpaying companies in Fresno County. The others are the Southern Pacific Railway, the Standard Oil Company and Miller & Lux. The tax of the Associated is almost \$17,000.

Southern California

The Associated Chambers of Commerce of Orange County will meet in Yorba Linda January 29.

Most of Calexico's cotton is still in the warehouses, being held until the market goes up to better prices.

Imperial shipped out its first carload of citrus fruit the first of December. It was made up mainly of grape fruit.

Cotton growers are not allowed to import cottonseed into California from any state where boll weevil is known to exist.

Many enrollments are being made in the two weeks' school in poultry husbandry planned to be held in Riverside next summer.

The matter of securing a farm adviser for Imperial County was discussed at the Farmers' Assembly held at Imperial last Saturday.

"Control of Grasshoppers in Imperial Valley" is the title of a circular just issued by the University of California. Its author is W. E. Packard, in charge of the experiment station at El Centro.

Walter E. Swingle of the United States bureau of plant industry has been in China, Japan and the Philippine Islands investigating citrus canker. In a recent talk at Riverside Mr. Swingle declares the canker as contagious as smallpox.

Highland, San Bernardino County, shipped about 15 cars of oranges for the Christmas trade. Southern orange growers are making no effort to rush their fruit East, leaving that trade to Northern and Central sections where the fruit matures earlier.

At the recent annual meeting of the Covina Citrus Association A. P. Kerckhoff was re-elected president, J. R. Elliott, vice president, and George Anderson secretary and manager. This association shipped last season 84,440 boxes of Washington Navels, bringing a net average to the grower of 82 cents per box; 46,522 boxes of Valencias averaging \$2.82.

The California state board of health is sponsoring a bill to be introduced in the next congress by which a subsidy of five dollars per week per patient may be paid by the United States government to institutions caring for non-resident indigent cases. This is to meet the great expense annually incurred by California in caring for destitute tubercular sufferers who come here from Eastern states every fall.

The Coast

The head lettuce industry is becoming an important one at Hood River, Oregon.

A farm adviser has been appointed for Navajo and Apache Counties in Arizona. C. R. Fillerup was the appointee.

One of the largest sheep deals consummated in Montana for years, was the sale of 12,045 head, commanding nearly \$65,000.

The Pacific International Stock Show at Portland last week brought together a splendid showing of cattle, sheep and swine.

The Santa Fe Railroad has announced a reduction of 13 cents per 100 pounds on dried fruits from California to Florida.

Eight thousand pounds of alfalfa seed grown on the Yuma project in Arizona has been purchased by the department of agriculture.

A number of plantings of Australian salt bush have been made in different sections of Arizona. It is reported to be growing well and spreading rapidly.

Stock markets of the Northwest report a pronounced shortage of sheep. Investigation discloses the fact that very few sheep are being maintained on range for later marketing.

D'Anjou pears raised in the Wenatchee Valley sold well this year. The pool of the Northwestern Fruit Exchange for the Wenatchee Growers' Exchange returned net to the growers from \$1.35 to \$1.90 per box.

Shipments of graded apples from the Wenatchee district of Washington, including Douglas, Grant, Okanogan and Chelan Counties, will exceed 4000 cars. The Growers' League shows record of 3607 cars shipped to date.

A "Buy at Home" campaign has been launched by the women of the Yakima Valley. They have gone on record as pledging themselves to purchase package or processed food put up in the state of Washington in preference to all others.

Hood River, Oregon, reports that for the first time in the history of the fruit district the local ranchers raised enough turkeys this year to not only supply the Thanksgiving demand but to furnish a Christmas supply. Not a single turkey has been shipped into the city this year.

Kirkman Nurseries

RELIABLE TREES AND VINES

Established 1888. Wholesale growers of Deciduous and Citrus Fruit Trees, Olives, Shade and Ornamental Trees, Grape Vines, etc. Our largest order last year was for 200,000 Deciduous Trees. This customer advises that he has 98 per cent stand. Let us supply your order this season—large or small. What do you expect to plant? Address Main Office, 2501 Tulare Street, Fresno, California.

More HOP Profits More Bales per Acre

Hop Growers who have taken advantage of our free service department have found it profitable. They have made money through our advice. We have shown them how to increase the number of bales per acre. What we have done for others we will do for you. Write us fully and frankly. Let us know the exact conditions you are working under. Send a sample of soil and we will tell you how we can help you. You will not be obligated in any way. We want every Hop Grower to know all about

Gaviota Fertilizer

How it increases land values while increasing the land's yield. We want to send you positive proof of the wonderful increases it has made. How it feeds the crops and improves their quality.

Read what Hop Men Say:

From a Grower in Sonoma County:—"After using HOP Brand for two years, I am thoroughly well satisfied with results both in production and quality."

Another Sonoma Hop Grower:—"I began using your HOP Fertilizer in 1911 and increased my yield from 180 bales to 378 bales."

From Sacramento County:—"I purchased HOP Fertilizer last year and have had splendid results."

Still Another From Sonoma County Says:—"HOP increased my crop from 8.36 bales per acre to 13.14 bales."

We will furnish the names of these men on application.

"The Care and Feeding of Crops"

is a little book that tells you in plain English some valuable truths about the correct way to put back into the soil those elements which the crops take out. It tells you how to increase the size of your crops and how to make your land more productive. Write today for a copy free.

TREATMENT OF UNFRUITFUL VINES

By F. T. Bioletti

HE failure of a vine to bear satisfactory crops may be due to a large number of causes, but there are two general cases to be considered; that of weak vines and that of strong.

No vine can bear good crops regularly unless it is vigorous. Lack of vigor may be due to unsuitable soil or water conditions, imperfect cultivation, to the attacks of phylloxera, grape root worm, root rot or other diseases or pests. The remedy in this case is to find the cause of weakness and remove it if possible.

Vigorous vines, however, may be parsimonious in their yield. In this case there are two conditions to be distinguished. Some vines fail to develop fruit buds. This is shown by an absence or paucity of blossoms in the spring. Others produce an abundance of blossoms but the blossoms fail to set and no fruit results.

Failure to develop fruit buds may be due to lack of sufficient heat to mature the wood. Some varieties bear well in the hot interior but hardly blossom along the Coast. An early autumn frost may injure the fruit buds or interfere with their development. The same effect may follow the complete or partial defoliation of the vines by grasshoppers, vine hoppers, mildew, sheep, etc. If this happens late the vine may not be perceptibly weakened, but the fruit buds on which the next year's crop depends may be prevented from developing. The flowers are developed in embryo in the buds during autumn.

The more vigorous the vine the more liable the fruit bud formation is to interference in this way.

Failure of the blossoms to set in the spring may be due also to several unfavorable conditions. Cold weather during the blossoming and excessively vigorous growth of the vine are the most common.

There are numerous devices which may be tried to overcome the sterility of vigorous vines.

First, longer pruning should be tried. Vines which have been pruned to spurs of two buds should be given three or four. If this does not cure the trouble cane pruning should be tried. Bowing the canes or tying them to horizontal wires may be helpful.

Next the perfect maturing of the wood in autumn should be promoted by ceasing cultivation and irrigation early enough to stop the new growth sometime before the early winter frosts commence. The canes should stop growing just about the time the crop is gathered.

Late pruning is sometimes effective by delaying the blossoming. A delay of a week or ten days in the time of blossoming can often be brought about by pruning after the end buds of the canes have started. This makes it more likely that the weather will be warmer and more favorable to setting during blossoming.

Finally various methods of summer pruning may be tried. These are all more or less weakening and should be used with discretion.

The setting of the blossoms can often be much improved by pinching. This consists in removing the extreme tip of the growing tip shoot with finger and thumb. It is done when the shoots are about 18 inches long and when the bunches of unopened blossoms are well in evidence.

More severe summer pruning later in the season is sometimes effective in promoting the formation of fruit buds for the following year. This is called topping. This consists in cutting off the ends, one or two feet, of vigorously growing shoots in June or July. It should not be done in excess and only with very vigorous vines.

Finally ringing may be resorted to

in special cases. This consists usually in removing a ring of bark about one-eighth of an inch wide from the cane just below a bunch. Its object is to hasten the ripening and increase the size of the grapes. Ringing an arm or even the whole vine in a similar way may hasten the maturing of the wood and the formation of fruit buds for the following year. This form of ringing should be done late in July or August, according to the locality. It can only be used with excessively vigorous varieties, such as the Black Corinth. Most varieties would quickly succumb to such treatment.

NURSERY INSPECTION IN FRANCE

Under the new regulations in France the following measures for inspection of nursery stock must be taken:

In order to get a license the firm applies annually, paying a fee: the form of application for nurserymen states that the applicant is already well acquainted with the regulations in force between France and the countries the applicant may deal with: that the applicant will conform to the regulations that may be laid down: that he will give every facility to officials; that he agrees not to include in consignments from his establishment plans derived from other establishments without having previously given ample notice (these other establishments also to be licensed): that he will attach to each consignment a copy of the invoice, with values, and a declaration that the whole consignment is from licensed and inspected cultivation.

A similar application is to be made by exporters of agricultural produce.

The licensed firm can then apply for inspection of the total stock intended for export. This inspection must take place within eight days of the application, and the firm then gets a certificate of inspection for that stock. Certificates of freedom from disease are given on the above inspection, if required, but no certificate will be given without a copy of the usual exporting documents. If it be desired to include in a consignment any plants other than those that have already been inspected, then inspection of these must also be obtained. Each consignment can be inspected separately if preferred and if it be possible. The exporter has to number each consignment, attaching this number to all documents.

The following are the measures to be taken in regard to nurseries and consignments:

Nurserymen have to take all precautions against pests and diseases, and to follow the advice and the formulae laid down by the phyto-pathological service.

During the winter, the nests of the brown-tail moth, the egg masses of gipsy and lackey moths must be destroyed on fruit trees and on adjoining hedges. From the first of September all new nests of caterpillars are to be destroyed on stock destined for export in the following autumn or winter.

Before lifting fruit tree stock, the nurseryman will strip all leaves and remove all nests, egg masses, etc.

Workmen who sort the plants, either in the nursery or in the building, should be well acquainted with the egg masses, caterpillar nests, etc., and make certain that none are left on. If sorting is done in a building, this must be a well lighted one.

When stock of fruit or fruit trees, roses and other plants is brought in tied bundles to the despatching building, if the plants measure more than five millimetres at the crown, they are not to be packed in cases until they have been untied and examined. For plants measuring from one to five millimetres the workman doing the

Farm Bureaus

FARM BUREAUS BEING ORGANIZED

On the first of July an addition to the Smith-Lever fund will become available for the employment of more farm advisers. At present there are 13 advisers in California, which uses the entire fund received from the Smith-Lever and the state university appropriation. This fund increases each year and with the beginning of the new fiscal year this increase will make possible the appointment of five additional farm advisers. When complete, or rather when the state has secured its full quota of this fund, it will be able to employ about 40 advisers, and it is anticipated that these 40 will be sufficient to meet the needs of the entire state. Up to the present time advisers have been appointed in 13

farmers in the county as contributing members. In addition the board of supervisors of the county must agree to pay the expenses of the farm adviser to the extent at least of \$2000. Then the state university and the nation unite in the payment of the salary, in the appointment and in the control of the adviser's work.

The latest counties to make an effort in this direction are Los Angeles and Imperial. A meeting for the purpose of organizing a farm bureau was held in Los Angeles last Thursday and one at Brawley, Imperial County, on Saturday. At these meetings Advisers Parker of Ventura County, Weinland of San Diego County and Mayhew of Madera County made addresses showing lines of work followed in those counties. Adviser Parker referred to the squirrel campaign of Ventura County, to the

Speakers at Los Angeles and Imperial County Farm Adviser Meetings

Left to right: C. H. Allen, assistant state leader and head of boys' agricultural clubs movement; H. A. Weinland, farm adviser of San Diego County; Thos. C. Mayhew, farm adviser of Madera County; center figure, Dean Thos. F. Hunt of the agricultural college; Farm Adviser Wm. B. Parker of Ventura County; J. W. Gilmore, professor of agronomy, state agricultural college; B. H. Crocheron, state leader of farm advisers.

counties and a dozen or more others are hoping to join the list. It is thought that by the first of July some of these counties will secure sufficient membership in their farm bureaus to secure the appointment of an adviser. The farm bureau is not recognized by the university, at least to the extent of appointing an adviser, until it has one-fifth of all the

effort to secure concerted action in the matter of flood control, to the attempted organization of the lima bean growers, to the securing of county free libraries and the effective work in the hog cholera fight. Adviser Weinland referred to cow testing work with San Diego County dairymen, the organization of the Winter Vegetable Union, squirrel control, also to the campaign to secure more general use of cover crops in orchards and to the work in range sections in securing forage plants.

Leader Crocheron referred to the fact that there are 7919 farmers in Los Angeles County and in order to secure a farm bureau it would be necessary for that county to enroll a farm bureau membership of between 1500 and 1600. Los Angeles County stands first of all the counties in the United States in its production of farm crops, as shown by the census of 1910 and commented upon by the Cultivator some two or three years ago, hence agriculturally it is the principal county in the state and of the 57 counties one-eleventh of the agricultural products comes from Los Angeles County. In consideration of these facts Dean Hunt stated that such a great county would be hard to organize into farm bureaus. In a sense it is more independent and not in such great need of the farm bureau as the smaller counties. However he assured the farmers of Los Angeles County that if the bureau is needed the university is ready to meet the need, and because of the county being so large if one farm adviser is not sufficient to do effective work the university would approve the appointment of others. It is one of the principles of the farm adviser movement that no help is given to a county or to an individual farmer until help is requested. It is not a missionary movement and the individual and the county must appreciate the advantages of the farm adviser movement and take the proper steps to secure aid.

A committee of ten was appointed to perfect the organization of at least 13 farm bureaus in Los Angeles County and to complete permanent organization to the end that a farm adviser may be secured. Prof. Norton of the Gardena High School, chairman of this committee, was instructed to call a general mass meeting as deemed necessary.

Buy Your Furniture and Home Furnishings in Los Angeles from Barker Bros.

—We offer out-of-town buyers every facility for economical purchasing by mail. If you are in need of home or office furnishings of any kind, and cannot visit our store in person, we will gladly furnish prices and illustrations of any goods we carry that you may be in need of.

—Our goods are reliable; assortments are largest; styles are newest, and most attractive; values are greatest; and prices decisively lower than in any other store; and our facilities to serve you and to make your buying most satisfactory, are superior in every way.

PLACE Your Order for Roeding's TREES NOW

We desire to emphasize the importance of placing your order for trees early. Everything points to an enormous planting season, while we have at this time a splendid stock with which to fill your orders, every day sees it grow less. Get in touch with us now. Send us your list for prices and suggestions. It makes no difference how many trees you want—anything from 5 to 5000 or more—we can supply you.

Apples

We have a magnificent stock of apples, all varieties. Delicious, Gravenstein, Rome Beauty, Staymans Winesap, Spitzenberg, W. W. Pearmain, Yellow Bellflower, Yellow Newtown Pippin, etc. Freshly dug, carefully handled, guaranteed true to name. Ask for quotations.

Grapes

Every leading sort—wine, table and raisin. Can be supplied by us in almost any quantity. Cornichon, Emperor, Flame Tokay, Malaga, Thompson Seedless, etc., well rooted and perfectly grown. All who have bought of us know the quality of stock we sell and the care with which it is handled. Get our prices.

Walnuts

We have a magnificent line of Franquette, the standard among walnuts and commanding the highest price on the market. Can also supply Mayette, Parisienne, Placencia Perfection, etc.

Olives

For years we have been recognized as the leading olive growers in the state. Our stock is grown under exceptionally favorable conditions and includes all the leading varieties, such as Manzanillo, Mission, etc. Ask us for quotations.

Oranges and Lemons

The demand for citrus stock this season is exceeding expectations. We have a fine assortment of all the leading varieties in Oranges, Lemons, Pomelos, Avocados, etc.

1916 Illustrated Catalog FREE

Our catalogue this year is more extensive than ever before. It lists and prices over 2000 varieties of fruit and ornamental trees, vines, shrubs, plants, etc. A copy will be sent free to any address upon request. Use the coupon at bottom of this ad.

**The
Lawn
and****Flower
Garden****NATIVE PLANTS**Written for California Cultivator
By Ernest Branton

WE should so build parks and country home grounds that people passing by or through would never suspect all of it to be man's handiwork. It is scarcely possible for one to so build that all seems natural, nor is such effect altogether desirable, but let us have California to the fore through the use of native trees and shrubs.

We must learn to love our own trees and other native plant materials, and this we shall do if we become intimately acquainted with them through garden association. No other class of plants will thrive with so little care or appear so luxuriant without other than the most ordinary treatment, for the garden soils and conditions are much better than on native hillsides, and are they not there always beautiful? Being especially suited to soil and climate they necessarily harmonize with local landscapes. Why should we use others except for variety?

If the argument advanced seems good let us then make the foundation planting of native material and introduce as much or little of the exotic into the super-gardening as our tastes dictate. The entrance to parks and home grounds may then be made

through it somewhat of a task, without apparent compensation. Now in the center of such a garden I would build a rest house, a grotto, an oasis with a drinking fount, or some attraction to lure one through the rock garden. For except you gain such an effect you have not builded aright.

Build for Permanence

We often are asked why we cannot have cottages, their coverings and surroundings as lovely as those found in England, the garden spot of the world. When we build of fire-proof and therefore time-proof materials we shall have effects equally beautiful. Our cottages of wood last about a quarter-century if not sooner burned down. If heavily covered with vines a wooden house will not last a quarter-century. How may we have time-mellowed scenes under such conditions? Build of brick, stone or concrete. Then may you cover houses with vines or overshadow them with protecting trees and rest secure from fire, decay, and unhealthy quarters until old Father Time shall make all harmonious and beautiful with the ever present touch of his magic wand.

Plant More Bamboos

Bamboos lend a tropical grace to all landscapes and are harmonizers in gardens of mixed planting. Some are deterred from planting in the belief that they are swamp plants only

"GARDEN BEAUTIFUL"

The long expected book on flower gardening has arrived; it is "The Garden Beautiful" by Ernest Branton, who needs no introduction to readers of the Times Illustrated Weekly. During the rainy season you may slip into your soft chair before the fireplace and stuff your cranium full of working plans from these 200 pages of instruction, programme and illustration. Mr. Branton has brightened the sky-line of hundreds of thousands of lives in his quarter of a century of editorial and field work on floriculture and affiliated arts. In this book he has handed us for permanent keeping and ready reference all that his long experience has developed and acquired. It is published in the Dollar Series of the Cultivator Publishing Company, and is on sale at the book stores throughout Southern California. It will rank with McGroarty's "California History" as a popular Christmas gift.—M. V. Hartranft in Los Angeles Times.

to appear altogether natural, as though one were entering a glade or grove in the wilds, untouched by the hand of man. Once inside we may change the scene, though but slowly, until when we come to the residence, the jewel of the setting, we shall see the luxuriance of the tropics; palm, banana, and the brightness of many flowers. For as we approach the house the richness and luxuriance should increase, even as when looking away from it the foreground should be brilliant and such effect gradually fade away until in the distance we see but the forest depths.

Beautify Rocky Land

It is hardly expected by anyone that a stony or rocky landscape should be highly productive of flowers, therefore to so plant tends to invoke criticism and ridicule and is destructive of harmony. It will prove far better to use trees, shrubs and vines. If, by reason of paucity of soil, any of these shall make a stunted growth it will be but a natural effect, whereas luxuriance of blossom under like conditions must appear strained and unnatural. The keynote to all gardening then would appear to be harmony. And so it should be, for is not art all of harmony and none of discord?

Oases and Grottoes

More and more am I impressed with the advisability of centralization in feature gardening, even as civic centers should prevail and dominate in municipalities. Of late I saw an extensive rock garden built on top of the general level, that is, rocks and soil had been hauled in to build up the rockery. This made walking

though some species grow on hillsides and one or two are dry soil plants. Because they are evergreens somewhat tender in growth it is believed by many that they may be injured by frost. While this may be true of the tropical species there are several that have proven hardy in gardens as far north as Philadelphia and in California at least a score of species will pass unharmed through our most severe winters.

Large Leaf Effects

To gain tropical luxuriance we should use large-leaved plants, and while palms and bananas first come to mind, there are many others. Aralias, senecios, cannas, gingers, wigandias, giant reeds and grasses, all lend to such effect. We should try gunneras, Rheum Collinianum, a rhubarb which "doesn't look it," and a host of such plants, always keeping in mind large leaves. There is no surer or easier way of securing tropical effects. Seek out the hardier members of plant families native to the tropics.

Evergreen Fruit Vines

More and more am I coming to the belief that we should plant for profit and pleasure combined. In looking for ornamentals choose those that also bear fruit. Avocado, guava, loquat, feijoa, carissa, custard apple, sapote, all are evergreen fruit bearing ornamentals. Of late we have been given evergreen raspberries and blackberries and some without thorns. These plants should be utilized for covering arbors, pergolas, covered seats, etc., thereby gaining an effective combination of beauty and utility.

EFFICIENT OPERATION OF TRACTOR

The history of the use of the farm tractor clearly shows that an efficient operator is essential if the outfit is to prove a profitable investment. Data collected show that inefficient operation more than any other one thing has been the cause of failures with gas tractors, being directly responsible for 21.9 per cent of all failures, while it also has considerable influence over other factors, such as heavy operating expenses, short life of the machine, etc., which are frequently assigned as the cause of tractor failures.

It is often stated that any boy can run a tractor, as its operation is extremely simple. But it is simple only in the way many things, which to the average individual seem exceeding complex, are simple; that is, it is simple to one who understands it thoroughly. It is an easy matter to learn how to start the motor, how to change gears, operate the clutch, and steer the outfit; but the ability to do all these things well by no means qualifies a man as an efficient operator. They are of much less importance than the ability to detect loose bearings and properly tighten them, to keep the carburetor adjusted correctly, to maintain the ignition system in first class condition, and many other things which are necessary to keep the motor operating efficiently.

The necessity of having the motor operated with a high degree of efficiency, both mechanical and thermal, is readily apparent when it is remembered that a large percentage of the motor's power is required to move the tractor's own weight, and any loss of efficiency is, therefore, especially noticeable on the drawbar, besides adding to the cost of performing the work.

Any man of ordinary intelligence can operate a tractor efficiently, but only after study and experience. To attempt to gain such experience by experimenting with an expensive tractor is apt to prove disastrous, as is attested by numerous instances. While such men with no previous training have become fairly efficient operators through experience with their own outfit, without incurring heavy repair bills, such cases are exceptions and not the rule. It will usually be cheaper and more satisfactory to take a course of instruction under a competent instructor either at some good automobile or tractor school or at some of the agricultural or technical colleges. The time and money saved in operating the tractor the first season will often more than repay the cost of such instruction.

It is sometimes pointed out that the average individual has little difficulty in operating an automobile successfully without special instruction, but there is a great dissimilarity in the two cases. The automobile is primarily a pleasure vehicle and expenses are not of vital interest; it is equipped with a motor with an immense amount of reserve power and need not, therefore, be maintained at high efficiency to give satisfactory service, while delays for repairs result mainly in inconvenience. Furthermore, to enable the average autoist to attain the degree of success which he enjoys there is maintained an enormous number of repair shops, manned by skilled mechanics who are everywhere available to make necessary adjustments and repairs. On the other hand the tractor is used for productive work wherein delays are expensive both on account of their effect on the crop and the enforced idleness of hired help, and it is highly desirable that most repairs be made by the owner, partly to save time and partly to keep down the operating expenses by avoiding employment of high priced repair men. From an economic standpoint the owners of tractors cannot afford to maintain an expensive re-

pair corps, and to become capable of making the repairs personally requires some study and instruction.

The warning contained herein is not given for the purpose of discouraging a farmer from attempting to operate tractors but with a view to insuring a higher degree of success through their use. The necessary training is easily obtained and at slight expense. The gasoline engine is still a comparatively new thing to many farmers, but one generation of well trained and competent operators will disseminate information concerning it so that future generations will acquire knowledge on the subject as unconsciously, yet as thoroughly, as the average farmer's son acquires the knowledge of horses.—A. P. Yerkes in Farm Management Monthly.

CARE OF FINISH OF YOUR CAR

Carelessness in washing and polishing a car is responsible for a great many cars getting to look old and run down so soon.

In washing your car be sure first to use plenty of water and not much pressure. Don't rub the mud and dirt off, but wash it off with water.

Thoroughly soften it and allow it to soak soft before trying to remove it at all. Do not allow anyone to rub fingers over a surface covered with

dirt as the small particles of dust will cut the finish.

You should have two sets of pails, sponges and chamois for washing. It is a good plan never to use the same sponge or chamois on the body and running gears.

Grease makes a smeary appearance on the body and should be kept off as much as possible.

Keep sponges and chamois clean and free from grit and dirt. Use a good body soap and lukewarm water for the last wash for the body.

If you can find a good body polish, it is good, but never use too much or put it on too heavy. Be sure and rub it thoroughly and leave the body free from it, or after a while you will notice it making a coating over the body that is hard to remove.

It is a good plan to go to the man who sold you the car and have him wash it up and show you how to care for it, if convenient. The nice appearance may be kept on a car for a year or two with proper care.

Never allow mud to dry on the body if possible to prevent, as it will make spots that only refinishing will remove.—R. A. Bradley, Colorado Agricultural College.

SELECTION OF SEED CORN

The efforts spent in careful selection of seed corn are resulting in better corn for the Washington farmers who practice it. Professor E. G. Schafer, agronomist of the Washington experiment station, states that more improvement will be possible along this line as soon as the grower recognizes that certain individual ears of corn have a higher inherent value than others. It is not unusual for one ear to produce double the yield of another ear which appears to be equally good.

The inherent value of a single parent ear was strikingly illustrated by such an ear producing 11 of the 12 ears in the winning sample of corn at the recent corn show held at Walla Walla.

The prize winning sample was produced by Mr. L. J. Campbell of Walla Walla, and was outstanding in its uniformity and good quality. Besides these 11 prize winning ears, 45 other good seed ears were produced by the same parent ear.

It is possible to improve corn just as live stock has been improved by culling out the weaker individuals. Some improvement has resulted by using only the ears that have the best appearance. Further improvement is possible by the performance test, where only the higher yielding ears are used for seed.

Among the causes for low yields of sugar beets the greatest single source of loss has been found by government investigators to be improper thinning. Unless properly supervised, laborers invariably leave too great space between plants. Other causes for light stands and low yields are poor preparation of the seed bed, improper operation of seed drills, late frosts, the damping-off disease or the ravages of such pests as flea beetles, cut and wire worms.

To avoid or diminish sparks of static electricity, a moist atmosphere is often made use of. To avoid the dangers of the second class of electrical sparks, one must use every possible precaution, and so plan and run his plant that there can be no possible contact of explosive vapors or solids with any possible source of an electric spark.—C. E. Vail, Colorado Agricultural College.

All the year'round!

The Yuba Ball Tread Tractor turns in its own length. This is a distinctive Yuba Feature.

There is another Yuba Feature that possibly has never been brought to your notice—the Yuba works all the year around.

Each season presents its use for the Yuba—plowing, cultivating, harvesting, hauling.

And then—when you have nothing else to do—use it as a stationary plant or do your neighbors' work at a profit.

PRUNING DECIDUOUS TREES

Continued from Page 611

with surplus wood removed, the first four branches having been allowed to fork, these again being shortened in as indicated. Much of the growth of an apricot or peach tree would be more straggling and more horizontally inclined, and not growing so much towards the center as with the prune, but the principle remain the same, to cut back the growth the first, and if necessary the second year, to get the required vigorous shoots: then to select three or four, properly spaced, to form future head. Strong horizontal growth must be removed as such branches would either be torn by the team when plowing or would have to be taken off later with the saw. The main idea to bear in mind in this early stage of the tree's life is the goblet form of somewhat flaring habit.

To Continue Right

With a tree thus properly started the next step is the proper pruning of the spurs, or laterals. The main branches are gradually increased by forking as the diameter widens, but judgment must dictate how much and how often this forking may be allowed at the annual pruning. Small laterals or spurs will be thrown out along all the branches, some of them of weak pendulous growth. These must all be cut back to four or five buds, and subsequently it will suffice to leave only two or three buds as an annual increase. This keeps them sturdy and such spurs will bear large fruit close in to the trunk and main limbs. Further, by keeping the tree open as a "goblet" they will receive sufficient air and direct sunlight which is necessary if they are to live and bear good fruit. The peach is an exception to the spur pruning as it bears its fruit mainly on the strong shoots of previous summer's growth and so requires a heavier cutting annually to induce such growth.

Pears and apples will form fruit spurs on the main limbs, but the slender laterals will also form spurs if shortened in at the annual pruning. To expedite this, these laterals may be pruned in the summer and strong surplus shoots cut out entirely. Apricots, prunes, plums, almonds bear their best fruit on two-year-old spurs; the laterals, being annually shortened, will always have good fruit spurs of this age.

As the trees get older the wood growth decreases and the strength goes mostly to the production of fruit. At this time it may be well to prune the annual wood growth closer, which will encourage the trees to more vigor and the making of new wood.

The cherry is in a class by itself, most growers practicing the "no pruning" method, except a little thinning out of useless wood. Even with this fruit, however, the laterals, kept shortened in, will form fruit spurs, the habit of the tree being to form spurs plentifully the whole length of the limbs. It is incorrect, however, to think that the cherry is injured by being cut back, and it would be interesting to see an orchard pruned in goblet form as above outlined, instead of being allowed to attain all the height and diameter trees will. As a commercial proposition a moderate sized, pruned cherry tree is more appealing than a forest tree of huge dimensions, bearing a phenomenal crop. Some of the best cherry trees in our experimental orchard are those whose tops have been sawn off, the stumps being grafted over.

Pruning is not work for a novice nor for a careless hand: it requires much skill and experience and a good pruner takes an intense interest in his work.

NURSERY INSPECTION

Continued from Page 616

packing separates the twigs to the point where they are tied and makes certain that no caterpillar nests are present. This final examination is to be carried out by a special workman or by the workman who finally places the plants in the case—American Fruits.

Why You Should Plant Olive Trees

In replying to the many inquiries coming to my office daily, and after a careful research for "facts" I am warranted in saying: **IT IS MORE ADVISABLE TO PLANT OLIVE TREES NOW, THAN AT ANY PREVIOUS TIME IN THE HISTORY OF THE INDUSTRY.**

Official statistics imply that were all the available olive land in the state planted and the trees in bearing, the supply would not equal the demand of the United States—hence, the only question to be solved is a systematic method of marketing the fruit through cooperation—which organization is well under way and will be in effect within a short time, thus assuring a liberal market at satisfactory prices, for all California Olives, which will be possible to produce; therefore

PLANT OLIVE TREES.

Write me for special prices on any number, size or variety of trees wanted, and withhold your order until you hear from me.

Ninety-nine per cent of my trees start right off and grow when properly planted. Sample trees for inspection are supplied prospective planters on request.

California's Best

PLANT

Grafted Walnut Trees

As to profits, the Walnut industry is an absolute certainty—because the growers—not the consumers—set the price on their product—and will continue to do so indefinitely.

HENCE, IT IS GOOD ADVICE TO PLANT WALNUT TREES NOW.

Can supply choice grafted trees of the best commercial varieties in any quantity and size desired—and on request will quote you attractive prices.

Can also supply **Almond, Pecan and Chestnut Trees** of highest quality. Write for free catalog of nut and fruit trees.

TUSCAN and PHILLIPS CLING Peach Trees, the world's best "true-to-name" Southern grown. Write for prices. 27 other varieties of Peaches. See my 1916 catalog, free copy on request

MANY PRUNES TO BE PLANTED IN 1916

Written for California Cultivator
By Sacramento Valley Contributor

There is a great deal of interest in prune planting on lands along the Sacramento River this season. Trees have been contracted for a number of different plantings.

The land on which these trees are to be planted is very fertile river front loam, deep and well drained, and with an abundance of irrigation water available the success of the enterprise seems to be assured.

A number of men who are financing these orchard propositions are wealthy old timers who have made their money in this part of the state and who know the history of the existing orchards in the Sacramento River section, know what they have cost and what they have produced.

The trees to be planted are French prunes on Myrobolan root, this sort having proven most satisfactory.

There is some difference of opinion as to the distance of planting, some believing that because of the relatively large trees that will be produced under the conditions here they should be 25, 26 or even 30 feet apart. Others maintain that it will make more money to plant them closer, say 16 or 18 feet apart, with the idea of taking out alternate trees in ten or 12 or 15 years, but getting far greater crops during the first bearing years of the orchard.

Some will practice clean cultivation; others will grow corn and beans and alfalfa between the rows where plenty of irrigation water is available. The latter system has proven satisfactory and the crop returns a part of the cost of caring for the orchard.

The rich lands of the Sacramento Valley are gradually coming under intensive cultivation and this will continue for many years.

PURE SEED—RIVER REGULATION

At the recent meeting of the Riverside County chamber of commerce in Blythe in the Palo Verde Valley steps were taken to advance the interests of pure seed legislation. This county organization gives promise of being of material assistance to agricultural interests, not only of that county but of the state. At the same meeting resolutions were passed touching upon a subject of vital importance to people along the Colorado River and to producers in the great central valley of the state. These resolutions indorse the Newlands-Broussard river regulation bill:

"Be it resolved by the directors of the Chamber of Commerce of Riverside County, California, assembled in Blythe, California, on this tenth day of December, 1915,

"That we view with alarm the useless and extravagant waste of our nation's natural resources, especially that of the timber and water supply, and we deeply deplore the inadequate means for their protection and conservation;

"We favor any and all judicious legislation, federal, state and municipal, the object of which is protection and conservation of these resources,

"That we most heartily indorse the amendment to Bill S. 2739, known as the Newlands-Broussard River Regulation Bill, and recommend its passage and adoption and we further respectfully request our representatives in congress to work for and to support the same."

Copies of these resolutions were mailed to all chambers of commerce in the state with suggestion that they write their representatives in congress requesting their support of the bill.

CALIFORNIA FINE ART

We have a letter from Hamilton M. Wright, formerly editor of publicity work of the Panama-Pacific Exposition, in which he refers to the fact that California's Magazine is to issue a beautiful work, "Art in California", which will show the accomplishments of California artists and especially will it preserve many of the beauties of the great exposition. We hope its price will be such that it will be within the reach of all of us.

BEET DRILL

ORANGE GROVE FERTILIZER DRILL

Live Stock and Dairy

FEAST OR FAMINE

Written for California Cultivator
By Special Live Stock Contributor

Either have so many fat hogs off the stubble and fat cattle and sheep from the ranges that we cannot handle them or there are so few available that we are forced to hunt high and low for them—it's either a feast or a famine." This is one explanation by a prominent California butcher for the present low price of meat animals on foot.

Continuing he said, "Our producers must find some way to regulate the supply of stock to our markets. If it could be strung out over a longer period it would be better for all. One

the same way. Another scheme is to cover the top with dirt and sow barley or oats on it.

The problem is to make a covering that will be as impervious to air as possible at the least expense. An Illinois farmer who has just come out to California for the winter says that he has recently finished filling his silos and that the same practice in sealing them has been used this year that has proven satisfactory during the past two. Black tar paper—the kind used in lining between the two outer layers of boards in Eastern houses—is laid in strips over the top of the mass of material in the silo. The ends are tucked down at the sides and the joints liberally lapped. Over the top of the joints and around

PRIZE WINNING STEER

This animal is proof of the good work being done at the university farm at Davis. Referring to this steer Prof. True writes: "This steer was a crossbred Hereford-Aberdeen Angus two years old. He won first in his class at the Panama-Pacific, was champion two-year-old, champion grade steer of any age in San Francisco and reserve to the grand champion of the show. At the recent Pacific International show at Portland

he again won his class, was champion grade or cross-bred, and again reserve to the grand champion of the show. He sold at auction to the Western Meat Company of San Francisco at 17½ cents a pound, which is the record price for a California steer and for the San Francisco market. Weighing 1670 pounds, this steer brought \$292.25. In addition to this during the fall he had won \$265 in prizes, so that he brought the university the neat sum of \$557.25."

way this could be accomplished would be for those who have fall feed—especially small farmers—to buy the half fat stock that is thrown on the market in the fall along with the fat stock and finish this feeder stock so that it would be available as well finished meat in the middle of the winter, say from Christmas on, when it is badly needed."

The stubble hogs will probably continue to come on the market in large numbers during September and October; the feed is available for them after harvest and it must be fed.

There should be a good tip in this situation for the man who grows hogs on the small diversified farm and who has greater control of his feed situation. He should plan to have his pork ready for market either before or after this run takes place.

Another factor that is said to be influencing the price of hogs at this time is the fact that our greatest buyers of lard and fat pork, Germany and Austria, are now out of the market. This has greatly lowered the price of these commodities.

COVERING SILAGE

Written for the California Cultivator
By Sacramento Valley Contributor

A number of things are recommended for coverings for silage. Rotten straw is often run through the silage cutter the last thing and thoroughly wet, then well tramped down so as to make a covering that will mold and make an impervious cover. Corn stalks with the ears snapped off are sometimes cut up very fine and run through after wetting, or with a liberal stream of water run in at the same time. Horse manure is used in

the sides wet corn silage is placed to hold the paper down and keep out the air. Last year only four inches of silage off the top of the silos was lost. When the paper was taken off when silo feeding began in the early winter it was thoroughly rotten. It required paper costing only 40 cents to do the job.

A GRAND BOAR

Regarding Superba, grand champion at the Panama-Pacific International Exposition, we quote the following estimate from the American Swineherd:

There is not a boar in the world who has won as many honors in the show ring (we mean at the best shows held) than the subject of our sketch, Superba. His last feat was carrying off the grand champion ribbon at the Panama-Pacific Exposition. Last season he was exhibited in his yearling form at the Iowa, Illinois, Missouri and Nebraska state fairs and won the first honors as well as winning at other fairs we could mention. He holds the same position in the Poland-China ranks in the show ring as Dan Patch does in the racing world—an undefeated winner. Superba has won 30 firsts and four grand champion ribbons. How's that for a record? Has never been beaten, weighs 925 pounds at two and one-half years of age in thin flesh. Superba was brought out by W. E. Willey of Steele City, Nebraska. He is sired by Skylark dam Anna Price 11th by Pawnee Lad, the best preserved sow for her age we have ever seen and who is still producing good things. Superba's winnings attracted great attention all over the United

Kemp and others whom we can not call to mind, which proves he was entitled to his rank. W. H. Rough of Arlington Station, Riverside, commenced to negotiate for this prize winning animal and it was not long until the deal was closed at a cost of \$800 cash. Superba is like Dan Patch, a noted sire as well as a winner and when you have all these qualifications in a boar you have something. We expect Superba to sire a great string of winners that will carry the family on to more fame because we have seen sons of his that are of that character.

**THE CALIFORNIA SWINE
BREEDERS' SALE**Written for the California Cultivator
By W. S. Guilford

I want to call attention to the fact that everyone interested in the hog business in California should attend the first sale to be held by the California Swine Breeders' Association. Even if you are not in the market to buy any pure bred hogs at this time you owe it to yourself and to the industry to be there to attend the meeting and banquet at the Travelers Hotel on January 26, 1916, and the sale at the fair grounds the following day.

The success of this sale means much to the pure bred hog business in this state and on the Pacific Coast. The breeders of registered hogs in this territory are producing as good animals as there are in the various breeds, and the public sale is to be more and more the means of popularizing registered animals and bringing about their more general distribution.

At a public sale the buyer has the advantage of being able to buy animals at his own price and be guided in the making of this price by other discriminating buyers. If public sales are to be made a success—and they are without question—only animals of high quality can be consigned. There are many reasons why a good breeder cannot and will not consign a poor individual to a public sale. In the first place he knows that it is only by the remotest chance that an inferior individual brings more than it is worth. And it costs just as much as far as expenses go to sell a poor one for a low price as a good one for a good price. Then no breeder wants to get the name of producing poor animals, and this would be the sure result of sending a bad one to a public place. So that the buyer is really the one who is the most greatly benefited by the public sale system.

There will be a fine lot of hogs sold at Sacramento; it will be the greatest opportunity ever presented to the buyers of pure bred hogs in California.

EXERCISE IS ESSENTIAL

It is very necessary that the little pigs have plenty of exercise and all the sunlight that can be given them. If they do not get exercise, they will get fat and lazy and the usual result is the "thumps." This is caused by the fat getting so thick around the heart and lungs that the pigs find it difficult to breathe. They will be noticed heaving at the flank and gasping for breath. The best way to prevent this is to avoid overfeeding and make the young pigs take plenty of exercise.

The sow, in order to produce a large, healthy litter, should be in the best possible breeding condition. After she has been bred, careful feeding and management are necessary to develop successfully the litter she is to produce. It is well to keep a record of the date on which the sow was bred in order to know approximately when the youngsters are about to arrive. The gestation period of pigs is 112 to 115 days. It is good policy to be at hand in case the sow needs help, but she need not be helped if she is getting along well.

Ruby & Bowers of Davis reports the sale of 43 registered stallions and brood mares in the past 40 days. Ten stallions and mares were shipped to Honolulu, seven mares to Montana and two mares to Washington. The prices ranged around \$800 for brood mares and the stallions sold at \$2300 each.

A HOG FEEDING PROBLEMWritten for California Cultivator
By W. S. Guilford

This is the season of the year when the largest number of well fattened hogs go to market. This is because grain is more plentiful now than at any other time. There is in the aggregate a large quantity of barley, corn and other grains that is left in the field. Hogs feeding on this make satisfactory and economical gains, and all that reach a weight of 150 to 250 pounds or more go to market.

After this cheap, by-product feed is all gone there are generally a lot of pigs that do not get quite big enough, and under ordinary conditions on the average grain farm these go over to the next year—just about living through in most cases—until they are able to get fat on the grain stubble of the succeeding year.

Now the question is whether it is best to just let these pigs go or to feed them a little grain and finish them at a weight of 150 pounds or a little better some time during the winter.

If they are fed some grain this winter advantage is taken of the growth and fat they have already made, and even if the gains on grain cost four and one-half or five or five and one-half cents per pound the initial weight of the hog is made marketable in addition to the gain, and money is secured this winter when under the other system the hogs cannot be cashed until next summer. Then there is always the chance of the animals dying from disease or starvation and exposure if they are not fed a little, and if they are this small amount of grain that goes to keep the animal alive is gone as far as gains are concerned.

There are many cases where it will be good business to finish out these young hogs. But if it is to be done they should be dipped in Kresol or oil to free them from lice, and turpentine at the rate of a teaspoon to every 100 pounds weight should be fed three mornings in succession on an empty stomach to clear out the worms.

And there should be some dry shelter from the cold rains we are apt to have any time now.

And if there is no skim milk or alfalfa pasture available it will pay to feed tankage at the rate of five or ten per cent of the grain ration. It is remarkable what a difference this will make.

**TO TELL A SHEEP'S AGE BY
THE TEETH**

A lamb has eight small first teeth on the lower jaw. When the animal reaches the age of about one year the middle pair are replaced by two permanent teeth; at the age of about two the teeth on either side of these permanent teeth are also replaced by a permanent pair; at the age of three the next tooth on either side gives way to a permanent tooth; and at about the age of four the last or back teeth are replaced in like manner.

Briefly then a sheep with one pair of permanent teeth is a yearling; a sheep with two pairs is a two-year-old; with three pairs, a three-year-old; and with four pairs, a four-year-old.

After a sheep is four years old one cannot tell by the teeth about the age. However, one who is purchasing a sheep, says T. G. Paterson, of the animal husbandry division, Minnesota university farm, should see to it that the teeth have not become long and shoe-peggy in appearance.

ORCHARD SHADE

Shade is one of the greatest essentials to be provided for hogs. We have often referred to the orchard as naturally providing this condition with no detriment to the trees if the grazing is done right. Any tree in the pasture lot will of course furnish this shade which is needed to protect them from the hot sun during the middle of the day. In case trees are not there a shelter can be cheaply made, strong enough to withstand the winds and tight enough to bar the sun. It would be well to have this shade augmented by a burlap over the door to darken the interior to some extent so that flies will not annoy.—Denver Field and Farm.

FIELD NOTES

Written for California Cultivator
By C. A. Briggs

Sixty acres of Modesto land owned by H. E. Cornwell now has on it a herd of 60 head (all ages) of dairy cattle, most of them being registered Holsteins. At present 31 are in milk, the product being sold to a high grade retail milk trade. As rapidly as possible all cows are being tested, nine having already been admitted to the A. R. O. Four that have just finished the seven-day test will be continued for the yearly test. The seven-day records are as follows: Senior year-

a practical farmer and breeder and is breeding along lines that the experience of a lifetime's work on dairy farms leads him to believe will produce the practical and profitable animal. The fact that probably every cow on his place will earn a place of honor on advanced registry goes to show that he is working along right lines.

* * *

Largest State Jersey Herd

The Rancho Dos Rios of Modesto has one of the largest herds of Jerseys in the state. There are now 427 head of all ages, 115 milking cows,

A Few Fine Ones From the Cornwell Herd

ling, age less than two years, two months after freshening, Gerben Beets 2nd, milk 216.5 pounds, butter 9.42 pounds.

Junior two-year-old. Senorita Ceres Mathilda, milk 280.4 pounds, butter 11.31 pounds.

Junior four-year-old. Abbie De Kol of East Bank 2nd, milk 486.8 pounds, butter 20.56 pounds.

Senior four-year-old, two months after freshening. Zoa Aaggie Pietertje, milk 403.1 pounds, butter 17.76 pounds.

Among the treasures of the Cornwell farm are two silver cups given to Hermana Mathilda Ciruela, who was the champion cow of the county at the Modesto fair. Mr. Cornwell is

98 calves and five herd bulls. This herd was established in 1867. Combination, Recorder, Stoke Pogis and Flying Fox blood speak for the lines of breeding carried on. The senior herd bull is Lord Dron, a grandson of Flying Fox. R. E. Watson, the manager of the ranch, is one of the young, energetic breeders that are so rapidly bringing the dairy industry of the state to the front. He is the president of the California Jersey Breeders' Association and a firm believer in the merits of the California strains of the breed.

The silo yields greater returns in proportion to cost than any other building on the farm.

TRIM THE HOGS' FEET

Written for California Cultivator
By W. S. Guilford

"I'd rather be those hogs than some folks' children," said a visitor at a prominent California hog ranch a short time ago. "I have heard of all sorts of attention being paid to dumb animals, but it sure looks to me as though the limit has now been reached when the hogs have to have their nails manicured!"

Now there was really nothing for our friend to be alarmed about. It was a rainy day anyway, so that the time would not be seriously missed even if it was wasted, but any one who could have seen the before and after of the hogs' feet that were "fixed" would agree that the time was well spent.

On some soft land in California there is not gritty material enough to wear the shell of the foot away as fast as it grows, so that if the surplus is not removed it is not long before the animal is walking well down on its heels and dewclaws instead up on the points of its toes as it should. After awhile the condition gets to be chronic and the animal become permanently "broken down" on its feet.

Some animals naturally have short, strong, pasterns; this part of the anatomy of some others is long and weak. The latter particularly need attention, but even the one with the strong conformation should have the toes clipped when they are growing too long.

It is an easy matter to throw a medium sized hog and lay it on its back in a good sized V-shaped trough. Then the excess foot can be cut off with a pair of sharp pruning shears. There will be no difficulty about telling how much to cut off, the horny part extending well out past the ball of the foot should be squared off so that the animal can stand upright on the foot. It is best to take off a little at a time; if too much is taken off blood will come—there is a "quick" in a hog's toe the same as in a person's finger, and if this is cut into the animal will be lame.

It is especially important that animals that are to be kept for breeders have their feet attended to as often as it is necessary; hogs that are to go to market do not matter so much, but it is a short job and all might as well have attention when the job is being done.

PURE BRED LIVE STOCK BUSINESS INCREASING

Editorial Correspondence

One good indication that many sales of pure bred live stock are being made throughout the state is the increasing number of animals seen on the express trucks at various stations along the railroads.

A few years ago it was a rare thing to see an animal in a crate at a shipping point, now it is very common to see hogs and sheep and cattle of all breeds.

It has been the history of all countries that greater prosperity is in store for any section where more and better animals are bred, and one of the most hopeful things in California is that the use of pure bred sires is becoming common and that in all parts of the state pure bred herds, flocks and studs are being established.

AYRSHIRE BREEDERS' ASSOCIATION

The 41st annual meeting of the Ayrshire Breeders' Association will be held in Philadelphia, Thursday, January 13, at two o'clock for the election of officers for the year ensuing. All persons interested in the breeding of Ayrshire cattle are cordially invited to attend this meeting.

It is the plan to visit the herds around Philadelphia the next day after the meeting.—C. M. Winslow, Secretary.

Four Cylinders**

Which one suits you?

Have you noticed the low-hung, powerful lines of the sturdy Sieve-Grips—the compact, clean-cut design that is the automobile standard of today?

Makes you feel that here is a tractor that you can work in tight places—under tree limbs, through vine rows—with plenty of power for work in the open field and stationary work. The Sieve-Grip is doing these things for others—it can do the same for you.

Strong points of the 1916 Sieve-Grips:
Absolutely dust-proof motor with 1916 model Nodust-Moisto-Rizer.
Center drive in rear wheels with lubricated roller pinions.
Sieve-Grip front wheel. Differential in dust-proof, oil-tight case.
Heat-bent, hot-riveted steel frame with full-length dust-pan.

We can't begin to tell you here all the advantages of Sieve-Grip Tractors. Why not ask us today for testimonials from Sieve-Grip owners who are doing the same kinds of work you are and also for our newest booklet, C.C.-3.

Poultry for Profit

COLD WEATHER DISEASES

Written for California Cultivator
By Jean A. Koethen

IT is doubtful whether roup should be classified as a cold weather disease or the opposite. Perhaps it might be called a damp weather disease, for it is nearly as prevalent in the foggy days of June as in the wet days of January. In fact no month is free from its ravages if only conditions be right.

Last summer I was amazed to find one of my young turkeys suffering with roup. I had believed that no bird that slept in the open and ran on well drained ground could have roup, but here was one that from the time it was weaned had roosted on top of a six foot fence and had never seen any soil but the driest of decomposed granite, manifesting every symptom of swellhead. Obviously the fault was not in external conditions but in the bird itself, and here is where our attempts at diagnosing diseases too often fail.

Two factors must always be considered when we are confronted with roup, the sanitary conditions surrounding the bird and the constitution of the bird itself. Rousy stock, i.e., stock descended from rousy ancestors, with a tendency to roup in its very constitution, is hopeless. Hence the first step in ridding a flock of roup is to begin, as Dr. Holmes advised educators to do, with the ancestors of future generations.

Two rules should be observed by every keeper of poultry: Never use in the breeding pen any bird that has ever had any sort of a cold; never keep a rousy bird on the premises. If the bird does not respond immediately to treatment kill and bury it deep.

Roup seems to be a sort of general term for every kind of a cold, with the exception perhaps of bronchitis and pneumonia. A watery discharge from the nostrils, swollen eyes or head or face, diphtheretic spots in the throat, cheesy deposits under the eyes, are all generally included under the name of roup. The first symptom may be a watery discharge from the nostril or a swollen look about head and eyes, or it may be merely depression and disinclination to move. Sooner or later, however, there appears a peculiar, heavy fetid odor, which is always characteristic of roup. No odor, no roup, is axiomatic. In general if there is any discharge from nostril or eyes, any swelling of the head or any noticeable odor, roup may be safely diagnosed. Some of the books make a distinction between simple catarrh, which is characterized by a thin discharge from the nostril, and roup, in which the discharge is thick, but the distinction is not observed in practice, for the thin discharge of simple catarrh rarely fails to develop into the thick discharge of roup.

When the case of a sick fowl is laid before me I am almost invariably asked, "Give cause and cure." Now the cause of illness is almost as hard to find with chickens as it is with human beings. There are always complications. We say, "Oh, he ate something that disagreed with him; probably he was overtired, too, or took a little cold, and anyway his liver wasn't working as it should." An attack of roup may have just as many causes. Poor ventilation in roosting quarters is one; dark, filthy houses is another; poorly drained runs or standing water in runs is another; overcrowding is a fourth. And, "anyhow", one is tempted to say, "the bird wasn't feeling exactly well in the first place." Perhaps there had been overfeeding, too little exercise, a shortage of green feed, careless breeding. Whatever lowers the tone of the system, whether it be from without or within, renders it liable to attacks of roup. Whatever increases the constitutional vigor of the bird, whether it be perfect sanitation or discriminating

selection of breeding stock, increases its resistance to the disease.

Roup is considered a contagious disease, and for this reason it is wise to remove sick birds from the flock as soon as symptoms are noticed, but it often happens that vigorous birds, although exposed, do not take it. Vigor brings immunity from this, as from most diseases, and birds that are kept under the strictest sanitary conditions, on well drained soil, breathing fresh air day and night, are not subject to roup, though an occasional sporadic case may occur among the weaker members of the flock.

The matter of drainage plays a very large part in the prevention of roup, just how large I am not prepared to say. In my own locality, where nearly all poultry houses are on a southern slope, protected by hills from the chill currents of air that blow in from the ocean, roup is practically unknown. The young turkey referred to above is the only case I have had in four years, and it was not of my own breeding nor did other birds contract the disease, although I made no attempt to isolate the sick one. In a hollow a half mile away where the wind draws day and night through a small canyon I saw, the last time I passed that way, a number of rousy birds. When poultry people learn that to avoid this scourge of poultrydom houses and runs must be high and dry and night quarters sunny and well ventilated, I venture to predict there will be very few epidemics of roup.

As soon as a case of roup is discovered or suspected the bird should be placed in the sunniest, driest place available. If it is not too ill to move about and eat a green, sunny range with airy coop at night will cure many light cases. A dose or two of quinine in one-grain doses is a good first aid to throwing off the disease, and a teaspoon of Epsom salts once a day in moist mash helps to clear out the system. Dipping the head for a few seconds in a pail of water colored red with potassium permanganate cleanses the air passages and is one of the best remedies. Dip the head twice a day till the discharge disappears. If there are white spots in the throat swab, with peroxide of hydrogen. When there is great depression and fever the case is almost hopeless. Quinine may possibly relieve, and there are many patent roup cures that are recommended, but when a bird remains in this condition for several days it is just as well to kill it. Such birds are rarely worth keeping.

Bronchitis

Sometimes in a spell of severe or wet weather a bird will suddenly develop a loud rattling in the throat; in severe cases it mopes and refuses to eat. This is bronchitis and must be treated promptly or pneumonia may develop. I found such a case among my pullets one morning a few weeks ago after a high wind and rainstorm. She moped on the roost and seemed to pant for breath. I removed her at once to the feed house and gave her a bed of dry straw and a little hard grain and lettuce to tempt her appetite. A good dose of olive oil saturated her throat externally and internally and was repeated in a few hours. For either chickens or children there is no better treatment in bronchitis than olive oil in liberal doses. I had no quinine in the house but did have some two-grain capsules which I knew contained mostly quinine. One of these was administered, not in the capsule, however, for I cannot swallow such a capsule and did not believe she could. She remained quiet in the house for a while but by noon was trying to get out. I let her out, for the sun was warm, meaning to return her to the house before night, but by feeding time I could not distinguish her from the rest of the flock.

Chicken-Pox

Of all the troubles that follow in the wake of cold weather none is so prevalent or so distinctively a cold weather disease as chicken pox. It comes winter after winter, frequently to poultry yards where it has appeared before, and sometimes to flocks that are isolated, and it is said to be more prevalent in a warm, wet winter than in a cold, dry one. Sometimes it appears in a very light form so that the birds are hardly inconvenienced, and at other times it is so severe that the loss is great.

Chicken pox may always be known by the scabs or nodules which appear on the comb and about the head. I cannot do better here than quote Dr. Salmon:

"The eruption appears as round, oblong or irregularly shaped nodules from the size of a pinhead to that of a pea or hazelnut. They are seen especially about the beak and nostrils and on the comb, the eyelids, the wattles and the ear lobes. In some individuals, and particularly in pigeons, the eruption is more generalized and is found on the skin and other parts of the body, as the neck, under the wings, on the rump and about the cloaca. Here the nodules may become larger than on the head.

The nodules begin as small red or reddish-gray deposits with a shiny surface and gradually enlarge, while the color changes to a yellowish, brownish or dark brown and the surface dries and becomes shriveled, uneven, and warty in appearance. Owing to the number of nodules and the extension of the inflammation, large patches of skin become thickened and covered with hard, dry crusts, closing the nasal openings or the eyelids and making it difficult even to open the beak.

In the more malignant cases the eruption is generalized over the surface of the body, the nodules are larger, and there is a diffuse inflammation and thickening of large areas of skin. If the crusts are rubbed or scratched off by the fowls there occurs from the ulcerous surface a discharge at first watery, but later thick, yellowish and viscid, which soils the feathers and, if abundant, gives off a disagreeable odor. This type of the disease is accompanied by fever, rapid loss of flesh and prostration, and frequently causes the death of the victim. In the most malignant cases, especially with pigeons, the eruption extends to the mucous membrane of the eyes, nostrils and mouth, causing a diphtheretic inflammation that is generally fatal."

I have given this description so fully because it is of the utmost importance that the disease be recognized as soon as it appears. If affected fowls are at once isolated and the premises thoroughly disinfected an epidemic may be averted, but this is hardly possible if the sick birds remain in the flock even a few days.

Chicken pox is usually treated by removing the scabs or crusts on the nodules and touching the sores with a feather dipped in undiluted creolin, or with a saturated solution of boric acid or with tincture of iodine. The sores may then be dusted with iodoform. In light cases anointing with carbolated vaseline is sufficient. Only

FARM LANDS FOR SALE

Farm Lands—20 Years to Pay. Fertile farms in Western Canada offered by Canadian Pacific Railway Company. Productive soil; good climate; ready markets; fine churches and schools; unexcelled transportation; all conveniences and opportunities of best farming districts anywhere. Prices \$11 to \$30 an acre; irrigated land from \$35. Loan of \$2000 to assist practical farmers in irrigated districts. Twenty years to pay—or sooner at your option. Long before your final payment is due your farm will have paid for itself. Also some improved farms with houses, barns, wells, fencing, and crops now growing on them on the same favorable terms. Interest in all cases only 6%. This offer is based on good land; we offer these terms because we know a farmer on our lands can "be successful"; he can live well and save enough to pay for his farm. Western Canada lands are naturally suited to growing grains, fodders, vegetables, dairying and raising horses, cattle, sheep, swine, poultry. Cash in on the high grain prices. Don't delay; the best lands will be taken first. Write today for free handbook and full information to J. S. Dennis, Assistant to the President, Department of Natural Resources, CANADIAN PACIFIC RAILWAY, Calgary, Alberta, Canada.

Carlsbad Irrigated Farm Land—Bordering ocean; on state paved highway and Santa Fe Ry.; 80 miles south of Los Angeles; government records show Carlsbad warmest in winter, coolest in summer of any spot in Cal.; deep sandy loam, model water system; low rates; lemons mature in summer when price is highest; immense profits in fruits and berries adaptable to coast territory; winter vegetables without competition; minimum temperature 1914 was 41 degrees; tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre; easy purchase terms. South Coast Land Co., G. Buxton, Sales Agt., Carlsbad, Cal.

FARMERS WANTED

VICTORIA, AUSTRALIA, offers special inducements. Government land, water, railways, free schools, 3 1/2 years to pay for farms adapted to alfalfa, corn, sugar beets, fruit, etc. Climate like California. Ample markets. Reduced passages for approved settlers. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

One Hundred Acres \$75 Per Acre Rice Land, Best in State for Sale—In a locality where rice is being grown now profitably. This soil is suitable for grain and alfalfa; in a section of Kings County which stands preeminent in farming circles for large crops. Write for particulars or call. Large or small tracts on easy terms. Hanford Real Estate Co., Hanford, Cal.

Adjoining the town of Concord and our farm are small tracts, just the thing for poultry, fruit and berries, which can be sold on rental terms, and we will assist buyers in many ways to get started in the poultry business. VALLEY POULTRY FARMS, Box 188, CONCORD, CAL.

Ten Acres Navels, 15 years old, 108 trees per acre. Water interest in well, cost about \$9 per acre. Concrete pipe line with standards. Early fruit. No smudging. Trees in good condition. Price \$6500. No trade. Address P. O. Box 806, Los Angeles, Cal.

For Sale—Twenty-acre ranch. Flowing water worth price asked. Five-room modern bungalow; forty by sixty hay barn; stock barn. Fifteen minutes' walk to schools, depot, post office. Address S. S. Lee, Lancaster, Cal.

Farms for Sale, Trade, Rent; any state; list free. 167 Farmers' Exchange, Denver, Colo.

For Sale—Forty acres level, well watered land, two miles north Waukena, Tulare Co., Cal., taken under mortgage for \$35 per acre. G. F. Stevenson, 329 Laughlin Bldg., L. A.

Wanted—Farms; have 2357 buyers. Describe your unsold property. 167 Farmers' Exchange, Denver, Colo.

MISCELLANEOUS

A Beautiful White self-bleaching, hard water soap; odorless and will not chap the most delicate hands. I am a hotel man and it was necessary to find a soap that would bleach and do perfect work and not ruin the linen. I tried many kinds of soap, but they were not satisfactory, so I began to experiment, and, after a number of years, I found the secret. It costs a fraction compared with the common soaps. I can make 50 pounds of bar soap for 40c. It positively does all I say and is easily made; just follow directions. I will mail this formula to any address on receipt of 25c in coin. E. C. Baxter, P. O. Box 421, Idaho Falls, Idaho.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

Dried Figs—Calimyrna seven cents; black 5 cents per lb. for 25 lbs. or more. Tribble Nurseries, Elk Grove, Cal.

RABBITS

Richey's New Zealand Red Rabbits won again at Riverside Fair, 3 medals and 3 ribbons. Beautiful B. Rock Cockerels for sale \$5.00 each, from Blue Ribbon stock. MRS. C. A. RICHEY, R. 8, Box 557, LOS ANGELES. Send 25c for booklet "Making a Living on an Acre" and "Care of Rabbits."

LIVE STOCK

Big Type Poland Chinas—December and January are the best months to breed sows for spring litters. Don't you need a better boar—one that will sire pigs that will grow faster and larger and get ready for market quicker on the same or less feed? You can't make any money at the present market price unless you raise good ones. Scrubby scrubs never pay. One of my May boars, sired by IOWA WONDER, will pay you well. Price \$20.00 each. They will not last long at that price; better hurry. Bred sows, bred gilts, open gilts. One to 2 carload. 600 head to select from. Satisfaction or money back. Registered and transferred free. Geo. A. Smith, Corcoran, Cal.

Billiken Herd of O. I. C. Swine—The big white kind. Early maturing, weight carrying; everything immunized against cholera by the simultaneous treatment. Pigs of both sexes from March, April, May and June farrows. Sires Chief Again, Iowa Boy, Missouri Lad and Woodview Earl. Dams are all of the big, smooth type and very prolific. A few bred sows about ready for their second and third litters. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

Rancho Rubius Herd Durocs won first under six months; Junior Champion; Reserve Grand Champion; Champion Sow bred by exhibitor, second sow under two years, and other premiums at P. P. I. E. A few bred gilts and service boars for sale. Place your orders now for weanling pigs. Elmer Lamb, Ceres, Cal.

Young Pure Bred Holstein Bulls for sale, sired by Prince Beauty Pierteje Segis. Some of these are 10 months old, others are calves 3 and 4 months old. All grand individuals and out of good ancestors. Prices reasonable. Write for breeding and prices. Laguna Stock and Dairy Farm, E. K. Putz, Prop., Laton, Cal.

 lege, New Mexico, the week of Janu-
 ary 3-8.

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this de-
 partment should be received at this
 office one week before reply is expected.
 Write plainly on one side of the paper
 and sign full name and address. Un-
 signed communications receive no atten-
 tion.

Dead Wood in Orange Trunk

A year ago I treated a number of
 orange trees for gum disease and have
 noticed this summer among those
 which had received large wounds that
 the wood had died back deep into the
 body of the trunk and many of these
 trees seem to have made only very
 indifferent growth, I presume on ac-
 count of this large amount of dead
 wood. It occurs to me that these
 ought to be subjects for tree surgery
 and would like to ask if you would
 advise the cutting out of all this dead
 wood? By so doing would not the tree
 be benefited by the full flow of sap
 which would not be possible with the
 old wood left on?—Subscriber, Exeter.

After scraping and coating with
 Bordeaux paste it would have been
 wise if the wood could have been
 covered with grafting wax or some
 coating which would have preserved
 and prevented its drying out. As it is
 we believe we would still coat this
 wood with grafting wax unless it has
 begun to decay. In that case all de-
 cayed matter and fungus should be
 removed, the cut should be disinfected
 and only firm, hard wood left.

Help Wanted

Replying to an inquirer who wished
 to learn regarding best grasses for
 pasture a subscriber suggests that the
 best plants for nearly all sections of
 California are bur clover or alfalfa.
 They give vastly more tonnage than
 wild oats or other native grasses and
 cure perfectly on the root.

Incubating Duck Eggs

I have a pair of pure bred
 Pekin ducks. Will you please tell me
 how to keep the eggs in good condi-
 tion until I have enough to set in a
 small incubator? I have one of the
 small, round incubators that holds 75
 eggs. Please tell me at what tempe-
 rature to run incubator, also what to
 feed the young ducklings. — Sub-
 scriber.

Keep the duck eggs, just as you
 would hens' eggs, in a rather cool
 place—about 50 degrees is best—and
 turn every day or two. If you have
 but one laying duck it would be much
 better to set your eggs under a hen
 as soon as you have ten or 12. Duck
 eggs three weeks old might do for

hatching, but I should not want to set
 them older than this, and it is better
 to set them before they are two weeks
 old.

If you use the incubator follow the
 directions that come with it. Some
 breeders think duck eggs should be
 kept at a little lower temperature
 than hens' eggs; others think they do
 as well at a steady temperature of 103
 degrees. Sprinkle the eggs every
 other day after the first week with
 warm water, for duck eggs require
 considerable moisture. They should
 be sprinkled occasionally, though not
 so often when they are under hens un-
 less the weather is damp.

When ducklings are 36 hours old
 begin giving them bread soaked in
 milk and sprinkled with fine sand or
 chick grit. Feed this four times a
 day for three or four days and then
 work them gradually onto a mash of
 four parts bran, one part ground oats,
 one part corn meal, and two parts

green stuff (fine cut lettuce is best).
 After the first week begin adding a
 little beef scrap to the mash and in-
 crease till at the end of the second
 week it reaches one part. Rolled oats
 may be added if desired. Always add
 sand or chick grit to the mash and
 feed moist for ducklings do not do
 well on dry food. For the first ten
 days warm their drinking water a lit-
 tle and give it only with meals.—
 J. A. K.

To Remove Warts

Please let me know how to take
 warts off a cow's teats.—Subscriber,
 Burbank.

If the warts are attached to the
 teat by a small base clip them off
 very close with scissors and touch
 spot with end of a red-hot iron. If
 warts are large and flat, then it would
 not be advisable to cut them off. After
 each milking apply plenty of olive
 oil over the teats.

Pollenizing Figs

I have several varieties of fig trees,
 the California Smyrna, Black and
 Adriatic. What varieties do I need
 to plant with these in order to effect
 fertilization? The trees are not now
 bearing well.—Subscriber, Ramona.

If by "California Smyrna" our sub-
 scriber means simply the so-called

The Household Department

I
am
the chil-
dren's Christ-
mas tree.
Arrayed with
toys and filagree,
And brilliant gew-
gaws deftly hung,
That catch the eye of
old and young. With
fairies bright and tinted
birds I call forth glad
enraptured words; and
merry eyes will greet the
sight when I am viewed by
candle-light. Beneath my
boughs there lies a scene Of
house and yard and village green;
With mimic railway running through,
As railroads oft are wont to do. I am,
also, a Christmas tree! And this will be
the death of me; For when the Yule-tide
season's past, Upon the ash-heap I'll be
cast. However, while I'm standing here
A host of children I will cheer, And cause
their youthful cheeks to glow, Because
of One Child long ago Who came
this waiting world to bless and
fill our hearts with happiness.
And so, you see, I'm glad
to be
The
lit-
tle
chil-
dren's
Christmas tree.

—American Printer.

O LITTLE TOWN OF BETHLEHEM

O little town of Bethlehem!
How still we see thee lie;
Above thy deep and dreamless sleep
The silent stars go by;
Yet in thy dark streets shineth
The everlasting light;
The hopes and fears of all the years
Are met in thee tonight.

For Christ is born of Mary,
And gathered all above,
While mortals sleep, the angels
keep

Their watch of wondering love.
O morning stars, together
Proclaim the holy birth!
And praises sing to God the King,
And peace to men on earth.

How silently, how silently,
The wondrous gift is given!
So God imparts to human hearts
The blessings of His heaven.
No ear may know His coming,
But in this world of sin,
Where meek souls will receive Him
still,
The dear Christ enters in.

O holy Child of Bethlehem!
Descend to us we pray;
Cast out our sin and enter in,
Be born in us today.
We hear the Christmas angels
The great glad tidings tell;
O come to us, abide with us,
Our Lord Emanuel.
—Phillips Brooks.

YOUNG MR. AND MRS. SANTA CLAUS

"It's just awful to be so poor at
Christmas time, Bobbie! I do wish
we could get some money."

Robert glanced at his sister and
was amazed to see that her dark eyes
were misty with tears. Winifred sel-
dom cried, and she was not given to
complaining.

"Don't feel so bad, Winnie," he
begged. "Father said he would get
you those books you wanted when the
lumber money comes."

"Do you s'pose I am such a selfish
baby as to cry about my own pres-
ents?" snapped Winifred, the fires
of indignation drying the tears. "I
guess I can wait for the old books."
"Well, I can wait for my skates, too,
so you needn't worry about that," de-
clared Robert.

"That's not it, either," said Wini-
fred soberly; "it's Aunt Winnie—I did
so want to send her something nice
for Christmas."

"She's so dear and good—think of
all the things she did for us last sum-
mer when she was here; and I'm
named for her!"

Winifred's voice broke on the last
words, and Robert's face was sober.
Pretty, vivacious Aunt Winnie, who
came, every summer, from the far-
away city to spend a blissful month at

the little farm house in the Catskills,
was the idol of the children's hearts.
No one was so clever, so com-
panionable as Aunt Winnie; no one
had such wonderful clothes, such
charming ways, such stories to tell.

"Well, Aunt Winnie knows that we
are poor," Robert tried to say cheer-
fully. "We can write her a great long
letter and tell her all about it."

"Yes," assented Winifred, bravely,
"we will just have to make the best of
it—but I did want her to have some-
thing from us, right on the very day!
She gets lonely, Bobby, I know she
does. Being a writer lady and get-
ting lots of money for stories isn't
everything!"

"And she loves the country so—if
she only could see the woods now, all
so dark and green against the snow."

Both children, born beauty lovers,
pressed their faces against the win-
dow pane. Soon Winifred spoke:

"Do you remember the stories Aunt
Winnie used to make up for us, when
we were little, about the Forest
Fairy?"

"I was just thinking about that,
too," the boy answered. "I wish we
could send her a piece of the woods."

"Bobbie!" cried Winifred, clutching
his arm with the breathless eager-
ness which characterized her sudden
inspirations, "have you any money at
all?"

"Twenty cents," he answered promptly.

"And I've got thirty—that will pay the express! Oh, Bobbie, you've struck it—you do have the brightest ideas—we will send her a piece of the woods!"

"You know in the city how they put green wreaths in all their windows for Christmas—we'll make six great big wreaths out of the pine and hemlock and those red bittersweet berries we gathered last fall.

"She's told me all about her apartment, heaps of times, and I know it has just six windows. Then we'll make her a pillow filled with pine needles—city folks love them!"

"Winnie, you're a wonder," Bobbie exclaimed delightedly. "Aunt Winnie will like that a hundred times better than anything we could buy. And say, there's all that birch-bark—can't we make something of that, too?"

"Boxes!" declared Winnie, promptly. "There's a big ball of red twine we can lace the sides together with—oh, and we'll fill them with nut meats."

"And we can make some of that maple sugar candy with nuts in it," broke in Robert. "Hooray! Come on, let's begin right now."

A few weeks later a slender, dark-eyed young lady, who looked as if she might be the little Winnifred grown up, sat by one of the windows of a fashionable city apartment, while the hurrying tide of Christmas Eve travel crowded the street below.

But the dark, tired eyes did not notice the passing throng—they glimpsed, instead, a stretch of cool, green woods, thick carpeted with soft, fragrant pine needles, where two children, with adoring, upturned faces, lay listening to her fairy tales. She came back from her dreamland with a start as the bell rang.

"Those blessed kiddies!" she said softly as she went toward the door. "I hope they will have a happy Christmas up there in their beautiful woods. I wish—"

She checked herself abruptly, and opened the door. A burly expressman, bearing a great box, smiled at her in friendly, Christmassy fashion.

"Merry Christmas, ma'am!" he said heartily. "I don't know what's in the box, but it carries the 'smell o' the woods that makes me think of the old home!"

Wonderingly she lifted the cover and the "smell o' the woods" flooded the room. On top lay a card on which was written in round, childish script:

A Box from the Forest Fairy
For Dear Aunt Winnie
Packed by Winifred and Robert.

Aunt Winnie's hands were trembling as she lifted the glossy wreaths whose clinging, spicy fragrance brought a swift rush of happy memories. She knew the slender, silvery trees that had given their bark for the birchen boxes.

Then her thoughts flew to the maple grove, while the glasses of clear, rose-tinted jellies, each enclosed in a dainty roll of birch bark, brought a vision of the garden with its long rows of currant and berry bushes.

And when, last of all, she found the pillow, with its cover cross-stitched by Winifred's clever fingers, she dropped her face against its delicious piney sweetness with a little happy sob.

"Those dear children!" she whispered; "thousands of youngsters could make such a Christmas box, but they are the only two in the whole world who ever would think of it!"—Woman's Magazine.

BURN OIL

SAVE MONEY

Star Oil Gas Burner

For Cook Stove or Furnace. Heat as intense as city gas. Burns cheap engine distillate. No smoke, dirt or odor. Absolutely guaranteed. Agents wanted. Make money selling to friends and neighbors. STAR OIL GAS BURNER CO., Pasadena, Cal.

CHRISTMAS

It comes this year as it has come for centuries, in spite of all the jarring voices that war against its gracious message. Its song of "peace on earth" rang out into a world that had little welcome for it; that denied even the right to live to Him who translated its music into a human life. It was a song of faith. Drowned a thousand times by the discordant shouts of hate and war, it has not faltered in the calm confidence of the truth it was given to proclaim. Again and again as the tumult and the shouting have died away, it has been heard still flooding earth and sky with its holy melody.

It is the song of the world's great optimist. There were ears that heard it even amid the darkness which fell upon that "green hill far away without a city wall." Ears there are that will hear it this year despite the clash of hostile armies and the roar of a thousand cannon. Multitudes there are who will sing it with the same confident faith as in those days of peace when they trusted reason was soon to take the place of war. To doubt the final triumph of the truth sung to the world in the "Glad Tidings" of its first Christmas day, is to sail a sea without a bottom or a shore, chart and compass lost.

We do not hesitate then to send out our Christmas greeting. The things that are seen are temporal. It is in the realm of the unseen that we must seek just now that which abides in the Christmas message and which no night of war, save for a time, can dim with its primeval darkness. Perhaps only such a horror as this could forever sicken the world of war.

If we dare not wish our readers a Merry Christmas, we do wish them all the gladness home and hearts may know when faith and hope and love still live. To all little children who look forward to the day with joy we send our wish for a very "Merry Christmas." Notwithstanding the pain and loss the year has brought, we shall find the Christmas joy just in proportion as we strive to kindle it in other hearts. Never was need greater since time began that each of us live out toward all men everywhere the spirit of the imperishable song, "Peace on Earth, Good Will Toward Men."—Our Dumb Animals.

AS OUR SUN DIPS WEST

The days grow shorter, the nights grow longer,

The headstones thicken along the way,

And life grows sadder, but love grows stronger,

For those who walk with us day by day.

But all true things in the world seem truer,

And the better things of earth seem best,

And friends are dearer as friends are fewer,

And love is all as our sun dips west.

—Selected.

DELICIOUS FUDGE

Here is a delicious fudge recipe and a novel suggestion. Did you ever make a fudge sandwich? It might be a good idea to try out for a Christmas day evening lunch when nobody really can be very hungry.

Two cups granulated sugar, one cup milk, two heaping tablespoons cocoa and a small piece of butter. Cook until it will form a soft ball in cold water. While the fudge is cooking beat the white of one egg stiff. Take the fudge from the stove when done and stir in the egg, beating the mixture until smooth and until it begins to thicken somewhat. Then stir in one-half cup walnut meats and pour into a buttered tin. When cool cut into squares and serve. The white of the egg keeps the fudge from drying out, and it may be kept for some time without becoming hard and brittle.

Fudge Sandwiches

The natural desire for sweets may be satisfied in a very good way by giving fudge sandwiches to children from six to 60. Beat fudge until creamy, and while still soft spread between thin slices of buttered bread. If not cooked too hard it may be kept in a bowl covered with a moist cloth for use as filling later.

THE SYSTEM FOR IRRIGATING ALFALFA

Alfalfa

cannot be raised advantageously without an efficient Irrigation System—and now is the time to install your system to the best advantage.

Get in on this money crop while the price is soaring to between \$18 and \$20 a ton in most localities.

But do not waste time, money and land and water with antiquated or inefficient irrigation methods. The best is the cheapest in the long run. Secure the advice of our experts—free, and write for some interesting literature invaluable to every rancher.

Kellar-Thomason Co.
1226 East 28th St. Los Angeles
"Originators of the Valve System of Irrigating."

WHEAT, ALFALFA

and other grains yield more where a perfect seed bed is prepared. The Western pulverizes, packs and mulches—makes a perfect seed bed at one operation. Saves seed, time and horse power. Is especially adapted for breaking crust on winter wheat or other grain or in orchards after irrigation or packing rains. It forms the hardest crust into a granular mulch without hurting the grain, and prevents evaporation.

Western Pulverizer, Packer and Mulcher 3 Machines in 1 made in 8 sizes, 1 and 3 sections, prices \$20 and up. We want every farmer to have our free catalog before buying a roller or packer. It proves we can save you money and have far the best machine. Contains full description, price direct to you, letters from many farmers proving its advantages over other makes, and much other valuable information. Send for it today.

HAY

Under date of December 18, Scott, Magner & Miller say:
Receipts of hay for the past week were 1561 tons, the week before 2423 tons, the preceding week 2861 tons. The market continues about the same as heretofore. No change to note with the exception of alfalfa which is extremely scarce with demand good. Fancy wheat and red oat when obtainable bring top quotations. Arrivals of medium grades continue to be in the majority and are moved from the tracks without much difficulty at previous quotations. Interior trade continues good with Southern California improving. There is no change to note in straw.

We quote the average wholesale prices for hay in carload lots on today's market as follows:
Fancy Wheat Hay (16 bales)17.00@18.00

Citrus Fruit Market

LOS ANGELES, Dec. 22, 1915.

The quality of the fruit has created an exceptional demand for California oranges. On the other hand, there has been a disposition on the part of some shippers to force an immense quantity of fruit into the market for the holiday trade. This in some sections has rather weakened the market though the great majority of shippers are holding for firm prices.

The lemon market is exceptionally fine. It is making the best showing that it has for years at this period.

Shipments

Shipments of oranges from Southern California to date since November 1, 1915, 950 cars, lemons 673, total 1623; to same date last year, oranges 787, lemons 440, total 1227. From Central California this season, oranges 2306, lemons 53, total 2359; last year same date, oranges 2720, lemons 81, total 2801. From Northern California this season, oranges 478, last year same date, oranges 393.

NEW YORK, Dec. 20.—Thirty-six cars lemons, one Arizona lemons, and thirteen cars lemons sold. Market strong and active on both oranges and lemons. Arizona higher on fancy, lower on choice. Weather fair.

Apples, Western, boxes, \$1.80@2.75.

ORANGE TREES

The Wallace Nurseries of Los Angeles have orange trees to sell and call particular attention in this week's issue to their special offer. One feature is that real estate or any other reasonable swap will be considered in exchange for trees. It now appears that it will be a big citrus year and the Wallace people are prepared to meet a heavy demand for citrus trees. They have not only Navel and Valencia oranges but lemons, grapefruit and all varieties of citrus. More particulars may be seen in their advertisement in this issue.

COLD WEATHER DISEASES

Continued from Page 625

one internal remedy is recommended. This is calcium sulphide, a well known remedy for blood diseases, which may be had either in powder or tablets from almost any druggist. The dose is one grain per day for each five-pound bird, and is best given in a small quantity of wet mash. Give the dose daily for a week, then omit for a few days and repeat if necessary. Dr. N. W. Sanborn, who continually prescribes this drug, claims that if it is given to birds that have been exposed, the disease will be lightened or averted altogether.

But the most important part of the treatment of chicken pox is the cleaning and disinfecting of the houses, yards, roosts and utensils that have been touched by the sick birds. This is absolutely imperative for the disease is so infectious that the germs remain year after year and infect each new flock of pullets. Walls should be washed with the garden hose and painted with kerosene and crude carbolic acid or whitewashed with a whitewash containing carbolic acid. Roosts should be washed with boiling water and painted with the same or some other strong disinfectant. Troughs and drinking vessels should be scrubbed and the surface soil of the yards removed. It is better to leave houses that have been infected empty for several months after cleaning. Only by the most extreme care can all the germs be removed, and if they are not removed there will be more infection.

QUESTIONS AND ANSWERS

Continued from Page 627

Smyrna, which is different from the Smyrna fig of commerce, none of these trees need other varieties for pollenization. Certainly the Black and Adriatic do not and we think the subscriber should look further for the cause of their not bearing. If the Smyrna referred to is the true commercial type of Smyrna then the caprifig must be secured in order to afford pollen and a breeding place for the little fig wasp or blastophaga. There are usually two varieties of this tree required, one for holding over the winter crop which keeps the wasp alive until springtime, then other varieties which bear early and afford the breeding ground. Or the caprifigs may be purchased at the proper season from those who have large orchards.

Liver Disease in Rabbits

My Flemish Giant and Belgian rabbits, fed alfalfa hay with a small handful of rolled barley appear to be well, but upon killing and dressing them I discover that the livers are spotted. What is the trouble and what treatment should be given?—Subscriber, Yorba Linda.

Probably the feed is rather heavy. The addition of green feed and the reduction of grain will perhaps be beneficial. We note in "Practical Rabbit Keeping" by Townsend: "Rabbits suffering from this complaint have difficulty in breathing, which is heavy and quite audible. They, however, eat well, and, with the exception of a dull, listless appearance, seem in good health. With correct feed and feeding and green food in season, particularly dandelion, rabbits rarely suffer from liver complaints. Should the liver become diseased or chronic inflammation set in, the patient had better be destroyed and thus put out of its misery, as the chances of permanent cure are exceedingly remote."

Caked Udder

A subscriber, Mr. L. N. Snyder, sends us the following regarding his experience with caked udder:

"Here is a remedy for caked udder in cow when 'fresh.' Equal quantities of beeswax and mutton or beef tallow or lard—tallow is best. Melt together and apply warm. (It can be kept warm by setting in vessel of hot water). When calf is three days' old I commence the application, if the cow has been giving milk before. With a heifer commence first day. Apply once a day. It always does the work for me in three days. It is a theory of mine that with and after the third calf it is best to let the cake stay in the udder three or four days. Am I right?"

*Facts
from U.S. Gov.
Bulletin 174*

Little Stories of Success No. 11

"Bankers Opinions regarding the tractor" is the title of table No. 2 in Bulletin 174 of the U. S. Department of Agriculture. The first question asked the bankers was: "Has traction farming had a favorable or unfavorable effect upon the farming industry in your vicinity?"

In California, where three-fourths of all the tractors in the State are Caterpillars, 95% of the replies were favorable. Conservative bankers almost unanimously voted Caterpillar farming a success!

Wouldn't a Caterpillar be a good investment for you?

We have other facts and figures regarding the comparative costs of animal power and Caterpillar power for farming. A postal will bring them.

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Cyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Cyclopedia. Write us about it.

These Well Branched Fibrous Roots Make Silva-Bergtholdt Trees Different from all Others

Roots are the Foundation of Every Tree

Our foothill grown trees are noted for their well branched fibrous roots—well toughened bark and wood fibre—hardiness and freedom from root knot—they are more hardy—have better roots and are free from diseases common to river bottom and valley loam locations.

Fruit Growers have learned the merits of our foothill grown stock and that is why there is always such a heavy demand for Silva-Bergtholdt trees. Fruit growers know also the advantage the early buyer gets both in price and selection.

Our Trees Are True to Name Behind Each Tree is Our Guarantee

You know now the trees you will plant. Submit to us a list of your wants and we will quote you an itemized estimate of their cost, giving you the benefit of the special prices we make to the early Fall buyer. Will also mail you our catalogue giving you accurate information as to every variety and useful information—write us now.

We know your wants—we know what the tree grower is up against. We have been fruit growers and fruit shippers as well as Nurserymen for twenty-five years. This puts us in position to advise you intelligently. Write us as to your problems and we will give you the benefit of our experience and observation.

If you want trees that will give you good service for a lifetime, write us for our catalogue and submit us a list of your wants.

We Make a Specialty of

PRUNES

French, Imperial, Robe de Sargeant, Sugar and Standard on Myrobolan root; also on Peach root.

APRICOTS

Royal, Blenheim, Newcastle Early, and all varieties—on Myrobolan, Apricot and Peach root.

ALMONDS

All standard varieties on Almond and Peach root.

WALNUTS

Franquette and San Jose Mayette, cut by R. Wiltz, the pioneer Walnut expert, from specially selected trees of absolutely true type—the highest pedigree that can be given a Walnut. Write for samples of nuts from parent trees.

SHIPPING PLUMS

Beauty, Formosa, Climax, California Blue, Diamond, Wickson, Gaviota, Kelsey, Grand Duke, Hungarian and all other varieties—on Myrobolan, Peach and Almond root.

CLINGSTONE PEACHES

Our Improved Tuscan Cling, Improved Hauss, Phillips of true type; and also other standard varieties.

CHERRIES

Royal Ann, Black Tartarian, Bing, Early Chapman, Early Burbank and Lambert on Mazzard root; also on Mahaleb.

OLIVES

All varieties grafted on Picholine root; also grown from cuttings.

Our assortment is complete in all other varieties of fruit trees and vines—write us now concerning your wants.

Bergtholdt's Special Selection for Home Orchard \$3.95
This is an opportunity to get 10 fine trees of choicest varieties of fruit delivered freight prepaid for only \$3.95. You can make your own selection or leave it to us and we will send you ten best grade 4/6 ft. deciduous fruit trees including one grafted walnut. Write for our list of combination offers for home planting and our free book on California fruits. Address Box B

One Dollar Yearly

The Farmers Union in Santa Clara Valley

Dr. Leroy Anderson Writes for Cultivator Readers of a Live Organization in Prune Land and Gives a Bit of History of the Central Organization

"Away down here on Llagas Creek,
Hail Farmers' Union Hail!
We welcome you to our picnic,
Hail Farmers' Union Hail!
We'll give you all you want to eat,
Hail Farmers' Union Hail!
For we've got the cooks that can't be beat,
Hail Farmers' Union Hail!

"We know you'll find it awful nice,
Hail Farmers' Union Hail!
To spend a day in Paradise,
Hail Farmers' Union Hail!
We know you all would like to stay,
Hail Farmers' Union Hail!
And if you'll be good, you may some day,
Hail Farmers' Union Hail!

Thus sang the popular Morganhill quartette at the annual picnic of the Santa Clara County Farmers' Union. The place was in Paradise Valley to the northwest of Morganhill, a beautiful little valley traversed by Llagas

Educationally and socially the work of the Union is similar to any other farmers' organization, the grange or a local farmers' club. The locals meet usually twice a month. Discussions are held on any topic of interest to the farmer, either locally or in the wider spheres of state and nation. Some locals either precede the meeting by a supper or follow with light refreshments, either of which helps to increase attendance and adds greatly to the sociability. The county Union is officially composed of delegates elected by each local and meets quarterly. This is largely a business affair where questions of policy and legislation are discussed. The state Union meets annually for a two-day session for the transaction of business relating to the state at large. Officially this convention is made up of delegates from county and local Unions. The social feature of the annual meeting is a

the carload from Salinas Valley and flour by the carload from the Farmers' Union mills in Oregon or Washington. Hence there is a direct saving to the members on all supplies which they secure through their Union. The Morganhill local is the largest in the state, having over 300 members.

In the spring of 1914 there was organized the Farmers' Union Buying Association of Santa Clara County with headquarters at Campbell. This was organized without capital and buys only upon orders from its members. Hence the business is small in comparison to that of Morganhill, and moreover, while it bears the name of a county association, its business is in reality quite confined to the locality immediately surrounding Campbell. The nucleus is there for a good business and a saving business for union members.

Cooperative Selling

When you talk to a Santa Clara farmer about selling produce, he thinks prunes and begins to talk prunes. Hence to be most useful to the Santa Clara man the Farmers' Union must be able to sell prunes. In order legally to negotiate a selling business there was organized by members of the Farmers' Union "The California Farmers' Union, Incorporated", according to the laws of the state governing such cooperative enterprises. The work of this organization is distinct from that of the Farmers' Educational and Cooperative Union. Becoming a member of the latter does not necessarily mean that one becomes a member of the incorporated body. But one must first be a member of the Farmers' Educational and Cooperative Union before he can purchase stock in and sell products through the Farmers' Union, Incorporated, which act constitutes membership therein.

The Farmers' Union, Incorporated came into existence at Fresno in 1909, and the business office was located there until 1913 when it was moved

the Eastern states and Canada. The 1915 crop of dried prunes it has to sell amounts to 2500 to 3000 tons from Santa Clara Valley. These prunes come from all parts of the valley and are packed in four different packing houses, three of which are owned by local incorporated Farmers' Unions.

A packing house was built by the Morganhill Union in 1911 and up to the present time about \$11,000 has been invested in the building and the business attached thereto. This year the packing house is handling between 1000 and 1500 tons of dried prunes.

The Campbell Farmers' Union, Incorporated began business in a rented packing house in 1909 and in 1912 built one of its own and equipped it at a total cost of over \$11,000. The prune pack at this house this year is in the neighborhood of 500 tons.

Encouraged by the success in other localities the Gilroy Union erected a packing house this year, and at the time of its dedication, August 13, there were 800 tons of prunes contracted for. The equipment was not yet all installed and the expense up to date for site and building had been \$8000.

Members of the Farmers' Union, Incorporated living in the neighborhood of Saratoga deliver their prunes to the private packing house of a member located at that place and he packs them.

Prunes

The acreage of this fruit in Santa Clara County is said by those who are good at figures to be 55,000 or thereabouts, and I understand that to be acreage of bearing trees. The normal crop of dried prunes is fixed by those same good calculators at 120,000,000 pounds or 60,000 tons. For the years of 1913 and 1914 the state horticultural commissioner has calculated that this county produced 62 per cent of all the dried prunes in California. If this be true it suggests the possibility that if all the growers in this

Farmers' Union Packing House, Morgan Hill

Creek and noted for its rich soil and never failing crop of prunes. Morganhill Farmers' Union picnics there every year, and so attractive is the place and so cordial the local people that the county union is readily drawn there. The local press said there were 2000 present but that might be discounted a little and still leave a big crowd. A grove of young eucalyptus had been set with tables enough for everybody to spread their lunch and to sit down in shade and comfort for the day's chief enjoyment. Coffee and lemonade was dispensed in abundance by the Morganhill Union.

Historical

The full and complete name of this organization is the Farmers' Educational and Cooperative Union of America. Its various divisions are local, county, state and national, and it began existence as a local Union formed at Point, Texas, August 28, 1902. The first local in California was organized in the spring of 1909. Santa Clara County was in early on the organization and now has 13 locals with a membership of about 108.

big feed at noon of each day. Strange how farmers do like to eat!

The Farmers' Union is a secret organization, has a ritual of initiation and holds its meetings in secret session. Occasionally open meetings are held to which the entire community is invited. The expense of membership is for women nothing, for men an initiation fee of two dollars and dues 75 cents a quarter, or two dollars and 25 cents per year. Half of the initiation fee and about half of the dues go to the support of county, state and national organizations.

Cooperative Buying

The most striking illustration in Santa Clara Valley of successful cooperation in doing business for its members is with the Morganhill Farmers' Union, Incorporated. The organization for business purposes was effected in 1911 and a packing house built. As both a producer and a consumer the farmer needs cooperation at both ends of his business, a place to pool his products for sale and a place to purchase supplies by wholesale. Just at present we will mention the buying end. The Morganhill Union buys for its members grain, mill feeds, fertilizers, flour, potatoes and many other commodities to the amount of about \$3000 per month. Where possible purchases are made directly from producers or manufacturers, as for example, potatoes by

Farmers' Union Packing House, Gilroy

to San Francisco. The manager, with the board of directors, does the selling of such dried fruit as is contracted for from the members. During the six years of existence it has sold 21,000 tons of dried fruit. The Union has had a market in European countries for about half its holdings while the remaining half has gone to

comparatively small region should pool their entire crop they could control prune prices for the state. If 1915 be a year of a normal crop, or 60,000 tons, and the Farmers' Union handles 3000 tons, that is only five per cent of the total, manifestly not enough to cut any figure in price fix-

Bean Giant Power Sprayer

The Power Sprayer for Large Orchards

For downright dependability—efficient work—high pressure—ease and economy of operation—low cost of maintenance—strength—durability—and all round satisfaction the Bean Giant is in a class by itself. Supplies 2 to 4 lines of hose and has a capacity of 7 to 12 gallons a minute. Good for 4 to 8 acres a day.

Thirty years' experience in the building of spray pumps is back of this outfit.

Built Complete Under One Roof

Every part is produced right here in the Bean factory—with the exception of the Novo engine and the Novo is used because a better sprayer engine can't be built. TWENTY-ONE DISTINCTIVE FEATURES are incorporated into the making of the Bean Giant—Patented Pressure Regulator, Porcelain-lined Cylinders, Rustless Ball Valves, Bean Patented Refiller, Truck with Rocking Bolster, One-piece Steel Frame, and many others.

We handle a complete line of smaller power sprayers and hand pumps. Before you invest in any kind of a Sprayer

LIFE IN THE SOIL (CONCLUDED)

By Howard S. Reed

It has long been known that there are specific varieties of bacteria for certain legumes and that it is useless to attempt inoculation unless one has the proper variety of bacteria. Bulletin 184 of the Kentucky experiment station, recently published, divides the bacteria into six classes, based upon careful studies made at that institution. These classes are as follows:

Bacteria of melilotus and alfalfa. The same organism is capable of infecting all these plants but will not infect clover, vetch, peas, soy beans, cow peas or other beans.

Bacteria of vetch and garden peas. The same organism will infect both of these plants but not clover, alfalfa, cow peas, soy beans or common beans.

Bacteria of cow peas. This organism will not infect any other cultivated legume although it is found on a number of native legumes.

Bacteria of soy beans. The soy bean is a native of Asia and was at first unsuccessfully cultivated in this country owing to the lack of suitable nodule forming bacteria. After introducing a quantity of earth and pods from Asia as inoculating material the soy bean was grown successfully, but when it is introduced to a new district it is usually necessary to use suitable inoculating material because the soil is lacking in these organisms. So far as is known the soy bean organism does not grow on other legumes.

Bacteria of white beans. So far as known this organism does not grow on other legumes.

Bacteria of the clovers. These will inoculate all clovers of the genus trifolium but they will not inoculate alfalfa, sweet clover, bitter clover, peas or beans.

The necessity for the proper race of bacteria brings up the question of inoculation. As previously pointed out it is necessary to inoculate if the suitable bacteria are not found in the field soil in which the seed is to be planted. Many hundreds of experiments have been made showing the benefits derived from this kind of inoculation. The yield of plant or seed may be multiplied many fold by attention to this necessity. Inoculation is more necessary on newly cleared land than in the older farming districts where the soils are usually well supplied with the different varieties of bacteria. However in the dryer parts of the country where dust storms are of frequent occurrence the bacteria may be transported over long distances and render artificial inoculation unnecessary.

There are two general methods of soil inoculation. The first is to obtain some soil from a field in which the particular legume has been grown and found to have nodules upon the roots. The second is to use artificial cultures of the desired organisms prepared by a bacteriologist. Both methods have their advantages and disadvantages. Soil is expensive if it has to be transported any considerable distance but it is the surest and safest method of obtaining the desired organisms. In soil these organisms will retain their vitality for several years after the particular legume has been grown. The artificial culture can be transported long distances at small cost and applied with very little labor. Its disadvantage lies in the fact that under artificial conditions the bacteria lose their vitality more quickly, especially if foreign organisms get in, and thus are incapable of giving the desired results. An examination of a large number of commercial cultures has been made by the different experiment stations and they report that in some cases no living nodule bacteria could be found. The inoculation by what-

ever means should be made at the time of sowing the seed, since it has been found that the bacteria do not retain their vitality for any considerable length of time on the seed. In some cases seed dealers have attempted to inoculate the seed at the warehouse for their customers but there is no reason to expect that such seed would be more valuable than un-inoculated seed at the expiration of a week.

Since the discovery of the nitrogen fixing bacteria which live in association with leguminous plants it has been found that there are other classes of bacteria capable of transforming atmospheric nitrogen into forms suitable for the nourishment of plants and that these classes of bacteria may live independently of other organisms. The importance of this class of bacteria lies in its ability to work wherever conditions are favorable without reference to the presence of legumes. As an instance of the amount of nitrogen which these bacteria are able to accumulate a single example may be cited. A field belonging to the Rothamstead station in England was abandoned for 22 years, producing nothing but wild vegetation during that time. In spite of the losses inevitably suffered through leaching it was found at the end of the 22 years that the soil was richer in nitrogen by an amount equal to 132 pounds of nitrate of soda per acre. Another interesting fact is that this process appears to go on most abundantly in soils somewhat deficient in nitrogenous constituents. In soils which ordinarily contain appreciable amounts of nitrogenous material the bacteria, appear to become lazy and cease to lay hold upon the atmospheric nitrogen, presumably drawing upon the fairly large amount in the soil.

One of the great benefits which has resulted from the popular interest in soil inoculation is the better appreciation of the conditions necessary for the activity of these bacteria in the soil. No matter how good the inoculation is it will be a failure if the field soil is not in suitable condition for bacterial life. It must be porous enough to admit air; it must have a suitable supply of moisture because the bacteria cannot do their work in arid or swampy soils; it must be free from an excessive amount of acid; and above all, it must contain a fair amount of suitable organic matter. When these conditions are complied with it is often found that the desired bacteria become active, the reason being that although they had been formerly present in the soil they were unable to do their work because of the unsuitable environment. In other words it is fully as necessary to give the bacteria a chance to do their work as to introduce them into the soil. In a well tilled soil containing suitable supplies of moisture and organic matter these bacteria are able to fix in a form suitable for plant growth large amounts of nitrogen which they take from the atmosphere. Under proper conditions it is to be expected that the most of the nitrogen supply of the soil can be obtained in this way. I believe that it is largely to this supply of home grown nitrogen that we should look for the future. We know that the visible supply of nitrate is limited and as the supply diminishes it will be but natural that the price will increase. The present warfare in Europe is depleting the nitrate resources of the world more than the production of farm crops over that area in a century.

The relation of bacteria to nitrogen has been extensively studied because in so many cases the supply of nitrogen is the limiting factor in crop production. But we are beginning to find that the relation of bacteria to other nutrient elements is also important. We know that in heavy, swampy

soils the sulphates may be reduced to sulphides, and so be lost to the nourishment of plants. On the other hand it has been found that in suitable conditions there are bacteria which will convert sulphides into sulphates. The transformations of the organic sulphur compounds are undoubtedly of great importance, but they have been as yet, little studied. The same is true of the phosphorus compounds. Soil phosphates are taken up by the cells of the bacteria during their development and later returned to the soil as organic phosphorus upon their disintegration. In some cases it has been supposed that the bacteria compete actively with the growing crop for the supply of soil phosphates. These questions, among others, await further study. They will undoubtedly be found to have an important influence on the question of soil fertility.

The foregoing discussion is an attempt to present a viewpoint rather than to announce any new or important discoveries. I desire merely to emphasize the fact that the soil is a dynamic rather than a static system. It is a world in which great living forces are continually at work. The soil is not the same from day to day or indeed from hour to hour because there are living organisms working in it bringing about changes of both analytic and synthetic nature. The substratum changes just as our bodies continually change as a result of the analytic and synthetic actions going on in them. The soil is not a cupboard into which a certain amount of nutrient has been placed for the use of plant life and which will be useless as soon as a certain amount has been withdrawn. A new soil is created from day to day which if intelligently managed will give food for plant and animal for centuries to come. Thus will the soil prove to be our one great indestructible asset from whose products we may supply ourselves not only with food and clothing but fuel and shelter as well.

CITRUS FERTILIZERS APPLIED AT SHORTER INTERVALS

Instead of a semiannual application of fertilizers many citrus growers are coming to observe the more recent practice of three applications a year. It is possible that even more frequent applications would be beneficial. The same conditions which make plant foods easily and quickly available make them subject to leaching. If the customary portion of fertilizer is allowed a tree once a year, it is able to use only a small amount of that immediately. The remainder is exposed to the weather throughout the year.

If the application is spread over the entire year at suitable intervals the tree will make more economic use of the food and the loss from leaching will be reduced to the minimum. Furthermore the progress of the trees over the growing season probably would be more uniform.

B. F. Floyd, plant physiologist to the University of Florida experiment station, suggests that four or more light applications a year would be best provided that unfavorable conditions did not prevent. During drouth the applications would accumulate in the soil so that when rains began the results would be the same as one heavy application. If the tree were mulched and the fertilizer were applied under the mulch, the rising moisture from the lower soil probably would counteract the effects of the drouth. Within certain limits the smaller the amounts applied and the more frequent the interval the more efficient the fertilizer will be. On small trees half a pound to the acre every six weeks would be a good practice. If the applications are frequent the fertilizer should be complete so that a large enough quantity could be had to scatter beneath the tree. It is probable that the yearly amount which is allowed each tree under ordinary practices could be reduced somewhat by more frequent applications.

ABOUT THE FEIJOA

I have noted with pleasure the discussion of the feijoa in the Cultivator of December 16 by Walter C. Ficklin of Kerman.

There are now in Southern California several thousand fruiting feijoa bushes. The majority of these came into bearing for the first time this fall. Their average age was two years from the nursery. The fruits varied in size and form as is always the case with seedling trees. The quality seemed almost uniformly good. The prolific tendency was satisfactory where the trees were grown in sufficient numbers to provide cross pollination. The result has been an increased understanding and interest in the feijoa. Almost without exception those who have eaten the fruit have expressed a high appreciation of it. In talking with perhaps a hundred such persons this fall I have heard but one expression of dissatisfaction.

The hardy character of the feijoa is a strong point in its favor. It will stand a temperature of ten degrees above zero. This is going to make it possible for everyone to grow it. So that, taken as a whole, I believe we have had a good, strong advance in the matter of feijoa growing. It has come to the point of acceptance by so many people that its future is assured.

The work now before us is the selection of a few first class types and their sufficient propagation to enable the grower to produce in abundance fruits of good quality and uniformity. This work is being taken up by several interested nurserymen, and while the propagation of varieties will be a slow process the right start has been made and the development of feijoa growing will unquestionably proceed along safe and satisfactory lines.—F. O. Popenoe.

CITRUS SPECIAL CONVENTION

A special citrus convention will be held at San Bernardino during the National Orange Show. State Horticultural Commissioner Cook writes:

"This occasion gives rich promise. The orange discussion will be led by C. C. Chapman who will speak especially of the possible value of a 'brand'. The discussion of the lemon will be in charge of C. C. Teague. A. D. Shamel has kindly consented to speak of the pomelo. Important new facts will be presented. Marketing will be discussed by our new commissioner of marketing, Colonel Harris Weinstock. Dr. G. Harold Powell will speak on the problems of the citrus industry. The citrus outlook of Butte, Sacramento and Tulare Counties, will be presented by Fred Mason, W. W. Hinsey and H. Webster, respectively. Soils and soil fertility will be discussed by Dr. H. J. Webber, Messrs. I. G. McBeth and W. P. Kelley, three very able soil experts. The eight to one orange test will be explained. Professor H. J. Quayle will give the latest on fighting scale insects. E. O. Essig and H. C. Bryant will give lantern talks on insects and birds, respectively. Col. Weinstock will repeat the address which he gave at Visalia, which elicited great praise.

This convention will be held at the time of the National Orange Show. Two such exceptional attractions must draw a host of citrus growers to these meetings.

A one-day apple meeting will be conducted by Chief Deputy Commissioner G. P. Weldon on Saturday, February 19.

A SHORTER CATECHISM FOR IRRIGATIONISTS

1. What is irrigation? Irrigation is the art of cultivating the soil so thoroughly that a minimum amount of water is required for the proper growth of crops.

2. What is rotation? Rotation is the irrigation dairy farmers' best hope. It means abundant feed for the cows, full time for the butter factory, and salvation for the settlers who conscientiously and intelligently apply the principle to the working of their farms.

3. What are the benefits which in this life accompany or flow from irrigation and rotation? Revenue to keep

the wolf from the door, to develop the farm, and a good deal in addition to spend on other things if the settler makes dairying his chief aim in life.

4. What is the duty which is required of every irrigator? To work his farm to the best advantages and to live in peace and harmony with his neighbors.

5. What is forbidden to irrigators? To feed their stock on the roads and channel reserves, to have dirty farms and bad fences, and to be constant "kickers."

6. Are all transgressions of the law equally heinous? All are bad, but wasting water is the very worst, since it injures the home farm and the man next door; also it probably floods the road, interfering with the proper conduct of business, and causing much bad language, which is an abomination.

7. What is the chief end of man? To get water into the soil and to keep it there by thorough cultivation.—Irrigation Record, N. S. W., Australia.

IRRIGATE WHEN IT RAINS

Many people, particularly those who have been used to farming without irrigation, are liable to overestimate the value of summer showers. They may brighten the lawn and help the grass but there is no comparison with the lasting benefits of a normal application of irrigation water.

Last summer South Idaho experienced two weeks of showery weather to the damage of much hay. Probably two and a half inches of rain fell. The soil showed wetting for a foot to 18 inches below the surface. But three days after sunshine came the sandier soils showed need of irrigation.

All crops and all farmers demanded water at once instead of one crop and one farmer after another, as would have been the case had it not been for the rainy weather. While canals had been running part full, pumping plants shut down or run at part capacity during the wet weather, a week later many of them could not supply all the water the farmer could use to advantage and crops were damaged. It is easier to irrigate in showery weather and we should do it if we are to avoid these "runs" on the water supply.—E. W. Hamilton, Agricultural Engineer, Idaho Experiment Station.

IRRIGATION PUMPS IN JAPAN

Primitive methods still are employed in Japan for supplying water to the rice fields. The apparatus used consists essentially of an undershot mill-wheel in which power is applied to the wheel to raise the water. In other words, the operation of the wheel is reversed.

The construction of the wheel is ingenious, particularly in the case of the wheel operated by foot power. Each paddle is carried by a pair of spokes braced by a pair of struts that lie in the direction of the thrust of the operator's weight. At the end of each paddle wheel is a short treadle piece on which the operator walks.

Of course, the advantage of this water wheel lies in the fact that it can be made cheaply and the operating cost is low, because labor is cheap in the orient.—E. W. Hamilton, Agricultural Engineer, Idaho Experiment Station.

GREASE THAT PLOW!

The best tools go soon enough. Ounces of grease save dollars in repairs.

The seeds of rust and decay bring a harvest of loss to the farmer.

If machinery displaces men and horses it demands more care than ever.

Keeping the polish on a moldboard may be better than shining in society.

Simplicity, reliability, durability and accessibility should be sought when you buy tools.

At the Missouri university farm they get good results from a mixture of whiting and hard oil. First make a thick paste then thin it by adding more oil. Apply to the moldboard with a brush and rub off with a gunny sack just before using.

If dependability and economy in your pumping equipment are of importance, you should have a

Deciduous Fruits

SMYRNA FIG GROWING IN CALIFORNIA

By Henry Markarian

TO grow figs successfully in California one must study the nature of the soil and the climatic conditions. The best region to grow the world-famed Smyrna and White Adriatic figs for drying commercially would be that portion of the San Joaquin Valley that has Merced on the north and Bakersfield on the south. Other sections fairly adapted for fig culture are: in Northern California the region lying between Marysville and Red Bluff in the Sacramento Valley and in Southern California

the interior valleys where the climate is dry in summer, almost entirely rainless, free from summer fogs and excessive dews, where temperature ranges from 90 degrees to 100 degrees or over in the shade from June to September.

Heavy rich and deep soil, color inclining to be reddish with plenty of irrigation water is desirable. In this kind of soil planting from 33 by 33 to 40 by 40 is recommended. Red soil underlaid by red hardpan from 12 inches to three feet, if properly blasted, is good. This soil contains an abundance of iron, lime and potassium, so essential to growing figs. Although trees take one or two years longer to mature in this kind of soil, still it will produce clean, white and elegant fruit, with hardly any sour and splits. The life of the tree under these favorable conditions would almost be everlasting; in this kind of soil plant trees at 30 by 30. In sandy soil (drift sand), alkali and in places where the high water level is three feet below the surface, growing fig trees is an absolute failure. Bottom lands adjoining rivers are not suitable for growing figs, as the figs would incline to sour and split.

Leveling and Planting

In planting fig trees I recommend level land if possible, so that during irrigation water will not form into pools and cause stagnation. If not so, level the ground into large checks so that when irrigating the water can be held back, to give an even distribution over the entire surface of the land. Or grade the land similar to orange orchards and adapt the furrow method of irrigation. Run several furrows between the rows so that a stream of water can run down the furrows for two or three days each time when irrigating. This is necessary for two years after planting, in order to insure a rapid growth of trees, which will hasten the trees into early bearing.

The ground should be plowed not less than eight inches in depth in order to thoroughly break through the plowpan or crust. After the ground is well pulverized dig holes 18 to 20 inches deep.

The best time in the season for planting fig trees is in February and March. When planting go over your nursery stock and cut the trees to a uniform length of two feet from the cutting joints. This will allow the trees to branch or fork 20 inches above the ground, which is proper height. Wax the tips to prevent drying, then plant so that at least three inches of the cutting joint is down in the soil.

A very important factor in the planting of the fig tree is avoidance of undue exposure. When the trees are taken from the nursery bed they should be kept in a barrel of water and taken out of the water one by one in the course of planting, as the trees cannot stand more than ten minutes' exposure to the cold wind or hot sun. The fibrous roots are as fine as hair and can be easily dried up by this exposure. After planting the tree water it thoroughly to settle the earth around the roots to eliminate penetration of air, using at least ten gallons of water to a tree. The same precaution should be taken while the trees are heeled in in nursery. Do not neglect this or wait until you get ready for irrigation, as many trees have dried up in the course of three or four weeks without water. Then either use a tree protector or redwood stakes four feet long to brace the trees. Drive the stakes on the southwest side 14 inches deep and tie the tree to the stake. These stakes not only brace the trees but protect them from the severe frost and the hot afternoon sun which usually follows after the frost. I have found from personal experience that in all cases the effect of injury from frost

appears on the southwest side of the trees.

Irrigating

After one month or six weeks irrigate the trees or water with water wagon. If the former run a furrow on each side of the row, three feet away, and let the water run, but care must be taken not to let the water run into low places and form into deep pools, as young trees, especially those planted the first year, can as easily be drowned as dried. After each irrigation hoe around the trees as deeply as possible and cultivate deeply from three to four times. The trees should be irrigated during the months of June, July and August the first year, also the second year, and the years thereafter, during May and July. When the orchard is eight or ten years old flood method irrigation similar to the alfalfa system is recommended. Each time of irrigating must give the ground thorough soaking.

Planting Capri Trees

In growing Smyrna fig trees it is essential to plant from three to five capri trees to every hundred Smyrna trees, either in a grove by themselves where they will be convenient for your close observation, or in a row running through the center of the orchard.

The fig tree is different from all other fruit trees. Other deciduous trees first bloom before the fruit appears, after which the foliage and the fruit grow almost simultaneously. On the fig tree first the foliage appears, with some scattering figs, which are called early figs or first crop, then it begins its branch, from six to ten inches in length depending on the age of the tree. This growing period extends from the latter part of March to the 15th of May at which time the tree ceases to branch. Then the figs for the first time are plainly apparent on the tree. About three or four figs appear on the lower part of the branch during the first week of production, the second week about two or three more appear, and finally about one or two more figs appear at the end of the branch on the third week of production. Naturally the first figs that appear on the trees mature first, and this is why it is absolutely necessary to have the early, medium and late varieties of capri.

The selection of capri trees requires very careful attention. The respective values of the various species must be carefully studied, and they are as follows: The Markarian No. 2 and Roeding No. 3 ripen very early; Markarian No. 1 and Pseudocarica, medium early; and the Milco, the late capri. This succession in ripening prolongs the caprification season, thereby fertilizing all the available figs on the trees. The Pseudocarica has another important feature in that the pollen appears on the mamme, which fertilizes the first crop of Smyrna figs ripening in June. Hereafter all the first crop, or the June figs, went to waste for lack of pollination; the introduction of Pseudocarica however will save the early figs which can be shipped green and bring a good and handsome profit.

It is absolutely necessary to plant 60 per cent of the early maturing as this early capri means the pollination of 70 per cent of the crop. Plant 20 per cent each of the medium and late varieties, which together pollinize 30 per cent of the crop. My favorite capri are Markarian Nos. 1 and 2, Roeding No. 3 and the Milco and Pseudocarica.

Pruning Smyrnas

Fig trees do not require as much pruning as other deciduous fruit trees, nevertheless they should be pruned and shaped. Allow the trees to branch from 16 to 20 inches from the ground because if the trunks are allowed to grow more than two feet the trees will lean, be exposed to frost and sunburn and become stunted. Many fig growers prune high so that they may drive their teams under the trees to give a close cultivation, but they have ruined their trees. The fig tree must be shaped as nearly like an umbrella as possible in order to absolutely shade the trunk from

Cut Your Gas. and Distillate Bills

GAZOLYTE produces oxygen in your engine cylinders at the moment of detonation. The oxygen thus produced gives you practically perfect combustion. Consumes the carbon and permits you to use ENGINE DISTILLATE in place of gasoline. INCREASES YOUR MILEAGE from 25 to 50 per cent. ADDS TO YOUR FUEL. Cuts your FUEL BILLS IN HALF. GUARANTEED HARMLESS TO ANY PART OF THE MOTOR. Half ounce only used to the gallon of your fuel. One quart sufficient for 64 GALLONS OF DISTILLATE OR GASOLINE FOR \$1.00 OR ONE GALLON, \$3.00 POSTPAID. YOUR MONEY WILL BE GLADLY REFUNDED IF YOU DO NOT SECURE RESULTS AS STATED IF DIRECTIONS ARE FOLLOWED. YOU ARE BOTH JUDGE AND JURY. GASOLINE RAPIDLY ADVANCING IN PRICE.—ORDER GAZOLYTE NOW AND SAVE HALF YOUR FUEL BILLS. Remit by P. O. Order or Bank Draft.

The Gazolyte Company, 1220 San Pedro St., Los Angeles, Cal.

frost and sun on all sides. I have further observed that all the large and vigorous trees are the trees whose trunks are well shaded. When the trees come to maturity at the fifth or sixth year they must be pruned back so that the lateral branches will become thick and dense, thus the foliage will prevent the sun from penetrating and burning the exposed limbs. This method must be followed every two years thereafter in order to make new lateral fruit wood and insure a large fruit and crop.

Pollination

The Smyrna figs contain nothing but female flowers and unless they are pollinated the fruit will grow to the size of a marble and drop off. Almost the same thing applies to the capri figs containing no insect; the fig grows three-quarters of its normal size and drops before maturing. The figs that carry over on the trees until they mature are fertile. The mamme fig is a winter crop, ripening about the first of April, the profichi matures in June and the mamme is a summer crop, maturing in fall. Each of these crops has a mission to perform. The mamme propagates or fertilizes the profichi, producing from 500 to 2000 capri figs to a tree. The profichi pollinates the Smyrna fig and produces from 5000 to 15,000 capri figs to a tree, sometimes producing more figs than leaves. It is well to remember that the entire crop of Smyrnas depends on the profichi. And lastly, the mamme, whose function is to preserve the life of one generation of the insect produces from 100 to 200 capri figs. The flowers of the capri figs are male.

The fig wasps, or blastophagas, live in the capri figs. They hatch three times a year (some varieties four). These blastophagas do not develop in the Smyrna fig but are employed as factors for carrying the pollen into the Smyrna fig. The male hatches first; he crawls about the interior of the fig seeking a gall which contains a female wasp. opens a hole with his powerful mandibles in the cortex of the ovary and impregnates the female while she is still inside of the gall. The female at once begins to enlarge the hole made by the male and crawls her way out of the gall.

When the profichi capri matures the stamens or male flowers appear in abundance and immediately the female wasps emerge from their birthplace (the capri fig) laden with pollen which collects on them while crawling through the cluster of stamens and finally out of the fig. Immediately they fly away, seeking a new home in which to lay their eggs for the next generation.

As already stated, the fig tree differs in many respects from all other

deciduous trees. The fig blooms inside when it is the size of a marble or a little larger, at which time one can get a whiff of fragrance from the tree when passing by. The insects, enticed by this odor, at once fly toward the fig and alight, seeking for the bud eye which is closed by overlapping bracts. They crawl in, but sometimes the overlapping bracts are so tightly closed that they are obliged to cut a way with their powerful mandibles to effect an entrance into the interior and then crawl through the orifice of the Smyrna fig, seeking for a gall flower in which to lay their eggs. In an endeavor to find such a place the insects come into constant contact and friction with the female flowers in the Smyrna fig and in so doing dispose of all the pollen which they collected. Disappointed, not finding gall flowers they emerge from the fig and perish.

While there is an abundance of profichi for the purpose of pollinating the Smyrna fig, nature has only provided a few mamme capri to connect the links of generation of the blastophaga, but needless to say these few insects multiply into myriads.

The female insect is black and has large wings; the male is red and wingless. The capri figs contain from 500 to 3000 wasps, one-fourth of which are male and three-fourths female. Of course these figures vary in the different species of capri.

Caprification

Caprification is very simple and intensely interesting. Any ordinary ranch hand in a few days can acquire sufficient knowledge to master the situation. After the Smyrna fig trees reach their maturity, which is the fifth or sixth year, depending largely on the attention, the trees must be caprifigged to reap the benefits from the orchard after years of waiting. The caprification season commences about the 10th of June and ends about the 5th of July.

To ascertain the ripeness of the caprifig, cut one open and you will observe that some male insects are visible (as already stated the male comes out in the fig first). This proves whether part of the female insects have emigrated or are about to emigrate. The practical way of picking caprifigs is to have a man go up to the tree with a ladder, and finding the soft figs, which are the ripe ones, drop them to the ground. Caprifigs, like other figs, do not mature all at one time. After the tree has been gone over the figs should be picked up from the ground as quickly as possible as they should not be exposed very long to the hot sun.

The best time in the day for picking caprifigs is from two o'clock in the afternoon until dark. Then about

four o'clock in the morning distribute them in the orchard. This work must be completed before the day gets warm, prior to nine o'clock, as the insects begin to come out at about this time and continue to issue for four hours after. After nine o'clock they should not be disturbed. A characteristic peculiarity of the capri is that after noon the insects cease to issue. This is the reason why the caprifigs should be picked in the afternoon and distributed early in the morning. The cost of picking and hanging the capri figs as often as is necessary will not exceed one dollar per acre.

Hang capri in wire baskets made with three-quarter inch wire mesh, four inches wide and ten inches deep, with a hook made from galvanized wire, which makes it easily removable from the tree. Hang five caprifigs in each five-year-old tree once a week for three weeks. As the trees get older the number must be increased as follows:

5-yr. tree, 15 capris:	5 every 8 days
6-yr. tree, 24 capris:	6 every 6 days
7-yr. tree, 50 capris:	10 every 5 days
8-yr. tree, 78 capris:	13 every 4 days
9-yr. tree, 104 capris:	13 every 3 days
10-yr. tree, 120 capris:	15 every 3 days
11-yr. tree, 144 capris:	18 every 3 days
12-yr. tree, 176 capris:	22 every 3 days

At the age of 15 years the tree is considered to be in its full bearing stage, and the amount of caprifigs to be hung on the trees will be from 175 to 200. The above figures are for normal sized trees. If the trees are exceptionally large apply a few more; if smaller than the average, a few less. In other words, apply according to the size of the tree.

Many growers have complained that the Smyrna fig does not produce as heavily as other figs. I have investigated and found that this shortage in every case is due to lack of sufficient pollination. My trees are now 12 years old and I have gone over my orchard eight times during the caprification season, hanging an average of 150 caprifigs to each tree, thereby giving my orchard a thorough caprification. If your caprifig supply is inadequate for your orchard, I should advise you to buy a sufficient quantity to thoroughly supply the requirements. They only cost five dollars per thousand, and I assure you it will not pay you to let your figs starve from lack of pollination. I have investigated the Smyrna figs after pollination and observed no injury sustained by excessive caprification.

Harvesting

The Smyrna fig ripens about the 15th or 20th of August and lasts until about the 1st of October. When the figs ripen they shrivel up and

drop from the trees to the ground. Then they are gathered or picked into 40 or 50-pound lug boxes once a week, after which they are hauled to the drying yard, spread on trays, stacked and covered and allowed to remain in stacks one week or ten days, until they are dry. The figs are then removed from the trays and washed in a water solution of five per cent and one-half of one per cent of lime. If the figs are too dry allow them to remain in water for about 20 minutes, after which remove and spread them back on the trays and stack. Let them remain in stack for one week, but late in the season spread the trays out in the sun till figs are dry, after that sort out all defectives and put in sweat boxes ready for delivery to the packing house. White Adriatics are processed in a similar way, except that the Adriatics are bleached by sulphur.

Smyrna Superior to Other Figs

It is sometimes claimed that the Adriatic fig is the best variety to plant on account of its heavy production. It should, however, be borne in mind that these heavily bearing Adriatic orchards are 25 years old. At the present time there are few Smyrna fig orchards in existence in California which are over 12 years old. And the erroneous information that the yield of the White Adriatic exceeds that of the Smyrna will be disproved when the Smyrna fig orchards planted in exceptionally rich and heavy soil reach the age of 25 years.

I have several reasons for advocating the growing of Smyrna figs. First, the superiority of the fruit; second, the quick maturity of trees (Smyrna fig trees mature in six years, White Adriatics in eight); third, the trees show very little or none of the root diseases so common to Adriatics; fourth, the trees are well adapted to orchard planting 30 by 30 feet apart, whereas the Adriatic at this distance would not be satisfactory. Furthermore, the tendency of the Smyrna fig tree root is to go downward and deeper into the soil, while those of the Adriatic have a tendency to spread circumferentially at a shallow depth; fifth, because the fruit is almost free from souring. The Smyrna fig may be shipped green and find a ready market.

As to the production of the Smyrnas, it is very hard to give a definite maximum figure, as there are only a few orchards now in full bearing in the state, and practically all of these are in their primal state. The only data I can give is as to the comparative production of the Smyrna and Adriatic in my own orchard. Both varieties produce equally heavily and

FARMERS' UNION AND PRUNES

Continued from Page 635

ing. However it is doubtful if Santa Clara had more than half a crop in 1915, which would place the Union holdings at ten per cent of the total. Still the tail is too small to wag the dog.

In this year of 1915 the packers say that Santa Clara did not produce one-half of the state's prune crop. We growers don't know yet and maybe never will know on account of the juggling which the packers do with the crop. However if they want it to appear that Santa Clara is declining in its supremacy in prunes, their juggling defeats that end. It is common report that the packers buy prunes in other parts of the state, ship them to San Jose and pack and sell them as Santa Clara prunes. Such fruit may thus be twice listed in the state's production, first as a part of the yield of Sonoma, Napa and Tulare and second as a part of the yield of Santa Clara. Growers find no difficulty in securing data from transportation companies of the carloads of prunes shipped from San Jose, but as yet they seem unable to learn how many cars are shipped in from other counties.

That there is need of a strong growers' organization was probably never more strongly felt than during the year now drawing to a close. When the prune trees were in bloom, or even before, the packers began selling the 1915 crop. On the basis of bloom the crop would be the biggest ever, and the price was fixed accordingly at three and one-half cents a pound or thereabouts. Reports of the quantity sold varied from 500 to 1000 carloads, or from 20,000,000 to 40,000,000 pounds, and not near that quantity had been purchased from the growers. It was pure gambling (if gambling can be pure) and gambling not only in money but in the very life of hundreds of farmers who with their families are dependent upon this one crop. San Quentin is too good a place for such gamblers; the beds are too soft and the meals too appetizing. But that practice has gone on for years and will continue until the growers get close enough together to kill it. Everyone knows the result in 1915. Instead of a bumper crop there has been but little more than half a normal crop. The packers began trying to buy at a price low enough to meet their selling price, and early in the season bolstered their arguments to the grower with statements as to how big the

crop is "in the other end of the valley". Shortly the Cupertino Improvement Club issued a call for a growers' mass meeting to be held in May in San Jose for the purpose of comparing notes on the crop prospects. This meeting had three results. The crop was held to be about 70,000,000 pounds of dried prunes; a motion was passed that growers should not sell under a five-cent basis, and a committee was appointed to keep the growers informed during the season as to crop and market conditions.

The committee met every other Saturday and after careful consideration issued a report which was published the following day in the leading San Jose paper which enjoys a wide circulation throughout the country. As the season advanced the committee could find no reason to increase the early estimate of the crop, and by harvest time there was evidence that the early estimate was too high. Market conditions were kept constantly in mind and there likewise seemed no reason why the basis price of five cents fixed in May should be discounted. Hence the effort of the committee was to encourage growers to hold for that price.

The market hung around three and one-half cents all summer, sometimes up to nearly four cents and then down again, but mighty little business done. Harvest began about the middle of August and suddenly four cents was offered by the packers and that at times for the first picking only if delivered in August. This price prevailed with occasional spurts up to four and one-quarter cents, for two months, and many prunes were sold. Probably the larger portion of the prunes had passed out of the growers' hands by the last of October. For a crop of unusually large sizes four and one-half cents may have been paid, but the bulk went for less than that. On the evening of October 28 two or three parties told me they had been offered five cents that day. Ten days later offers of five and one-half cents were reported. Growers who had sold for four cents said that the price would have gone to five cents a month earlier if all the growers had refused to sell for less. But the growers did not stick together and maybe the packers did not receive the lesson they need—to stop gambling in bloom time.

Of course there is need of a strong growers' organization. Speculation and gambling must be eliminated if the growers are to receive fair returns and the market centers be kept in good humor. If all growers should pool their fruit with the Farmers' Union that organization could handle the situation. Its record thus far is that its returns to growers are equal to, or slightly above, the average prices received by growers who sold to packers.

PART OWNERSHIP

Most people in this country believe that the tenant is a menace and that the owner is more desirable because he maintains soil fertility by live stock farming and other good systems and manifests more public spirit. Others believe that with a system of long leases such as prevail in England the tenant would be able to conduct his operations with a much smaller investment and without many of the objectionable features of tenancy as it now exists in this country. We will have to readjust our ideas somewhat radically to reach the present English condition, but many of the advantages of ownership and tenancy can perhaps be combined without any revolution in our present ideas, according to O. R. Johnson of the farm management department of the University of Missouri.

In a survey of the western part of Johnson County the department found that the size of a farm business has a close relation to the income which the farmer receives for his work and that small owners may often enlarge their operations by renting additional land. This part owner stands with the owner in the social matters, both from the standpoint of the individual and that of the community which he is helping to improve. In fact in the region surveyed he spent even more for his family living than the man who was renting no land. This includes

what he grew on the farm, and he was much more nearly self-sustaining because he produced a greater portion of his living on the farm and bought less of it at the stores. The interest chargeable on his total investment was less than two-thirds as great as in case of the owner, for the total investments were \$7633 and \$12,555 respectively. It must be remembered that even after renting some land from others these part owners had only about seven and one-half acres more land apiece than the owners, and ten acres more than the tenants with whom they are compared. The actual figures were 143.6, 136 and 133.5 acres respectively.

To a considerable extent the matter may be summed up by saying that the owner made a labor income of \$314 a year on 136 acres, the part owner \$456 on 143.6 acres, and the tenant \$531 on 133.5, but many people would be willing to pay the additional \$45 a year for the advantage of knowing that it would not be necessary to move in a year or two, make new friends, and establish a system on a new farm. The difference between labor income the part owners and tenants have is more than counterbalanced by the higher standard of living of the part owner who spent \$64 a year more on family living. The average owner in that region probably does not realize that his labor income is as far below that of the tenant or part owner as Mr. Johnson's figures show. He does not realize that so great a portion of what he regards as income is not income from his labor but from the money investment which his land represents.

THE THIEF OF TIME

Development of rail shipment of farm products in carload lots has forced the grower to become a student of transportation as well as of agriculture. Demurrage, the money penalty shippers must pay for undue delay in unloading ships or freight cars, which was first exacted in 1887 at the most congested terminals, is now collected on all roads at all stations. Forty-five of the 48 states—all except Delaware, Utah and Wyoming—have railroad commissions or similar bodies. In 12 states demurrage is regulated by statutes and in 23 states by orders of the railroad commissions.

A uniform code for interstate traffic has been adopted by ten states—Indiana, Iowa, Kentucky, Louisiana, Maryland, New Hampshire, North Carolina, Ohio, Tennessee and Wisconsin. The office of markets of the department of agriculture has made a summary of demurrage information for farmers in Bulletin No. 191 which should be carefully studied by every shipper who is sending carload lots.

The value of the enforcement of demurrage laws is not merely to release cars to benefit the railroads but to prevent car shortages which farmers face each year. The shipper who takes two to seven days to load or unload a car, when he should do it in as many hours, is robbing someone else of the use of this car at a later period; it is right that he should pay for his delay in starting the car on its way.

The department of agriculture declares that the persons responsible for car detention are business men who find it more profitable to use cars for storage than to provide other facilities; they are willing to pay demurrage for the store room.

As a rule farmers are not transgressors of this law. Their products are perishable, and they are usually anxious to ship quickly. The few carload shipments they receive are removed quickly upon arrival. To enforce demurrage requirements, however, it is necessary that the farmer conform to the same schedule of charges as the manufacturer. He can afford to do this as insurance against a scarcity of cars at a time when he has a large amount of perishable products awaiting shipment.—Country Gentleman.

THE STANDARD SOIL TESTER

AT
YOUR
SERVICE

It Will Show You Accurately:

1. Whether a soil is in the right chemical and physical condition.
2. Whether a soil is slightly, moderately or extremely acid.
3. How much Lime is needed per acre to counteract the acidity.
4. What quantity of Carbonates (Lime and Magnesia) a soil contains. It will indicate quantities, both in "percentage" and "in tons per plowed acre." From this you will see whether

- a soil is lacking in them or has plenty of them.
5. Whether disclosure of Carbonates is Alkali or Lime.
6. Whether a soil is lacking in Humus. It will show you whether a soil contains 1 per cent or more, ½ per cent, or none.
7. Whether a soil is in need of a green manure crop.
8. It will demonstrate the probability as to whether a soil will respond to applications of chemical fertilizers or not.

Questions

THE EDITOR

and Answers

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Black Color of Olives

How can I retain the black color of ripe California olives?—Subscriber, Los Angeles.

This question was referred to Prof. Frederick T. Bioletti who was asked as to whether any chemical or substance could be added to aid in keeping the color. He answers: "I know of no chemical which can be legitimately used for retaining the black color of ripe olives. The color is kept or intensified by skillful handling of the lye treatment and exposure to the air at intervals during this treatment. The exact method used varies with the different producers who make more or less of a mystery of the matter. In a general way the process consists of a partial lye treatment with a fairly strong lye one and one-half to two per cent followed by aeration for 24 to 48 hours and a supplementary treatment with a weak lye, say from three-quarters to one per cent, until the lye treatment is complete, with supplementary aeration with the weak lye treatment if necessary."

\$732 from One-fifth Acre

A subscriber at Lodi writes of his experience in making large sums from small acreage, stating that he has made \$732 from one-fifth of an acre in rhubarb and that it is one of many crops that will pay for good care. As this means a return of \$3660 per acre it appeals to us that great caution should be exercised on the part of other producers in counting on such abnormal returns. Only a specialist, under the best of conditions, can make small tracts of land produce enormous sums. We give this warning because of much suffering caused by the uninitiated trying to do the work of the expert.

Feeding Spineless Cactus

In your issue of the Cultivator of the 16th one of your subscribers wishes to know how to feed spineless cactus. I have raised it for the last couple of years and fed to my chickens. I take a slab and slice it open and throw in the pen with the sliced side up. The chickens will pick all the inside out until the rind is as thin as paper and look for more. I have some growing where I built another yard for some of my White Orpingtons and they are eating it off the stalk, where they can find a place to get through the rind.—C. S. Eichholtz, Pasadena.

Oak Root Fungus

An El Monte subscriber left at this office a specimen of root from a dying walnut tree which was seriously affected the subscriber thought by oak root fungus, though to his knowledge no oak trees had grown on the affected land. The root was sent to Prof. H. S. Fawcett and he replies: "The specimen appears to contain without much doubt the oak root fungus."

Feeding Pumpkins to Hens

Will you tell me if it is all right to feed chickens pumpkins? — Subscriber, Snelling.

No hen of my acquaintance will eat

raw pumpkin. If they would, and I had the pumpkins, I would certainly let them have one to peck at occasionally. Of course, the pumpkin does not supply much in the way of material for egg manufacture, but it might take the place of a part of the green feed.—J. A. K.

SMYRNA FIG GROWING

Continued from Page 639

both are constantly increasing the average of production per acre, until it has reached its present average of over two tons. This amount will increase as the trees grow older and will doubtless reach a maximum of four to five tons per acre when in full bearing at the age of 15 years.

In all my years of experience in fig culture in California I have never seen a total failure. We have had severe frosts and early September rainstorms which lessened the crop to only one-fifth of its normal production but never totally destroyed it.

Conclusion

I am fully convinced, judging from unabated activity shown in the production of Smyrna figs that fig culture is destined to become one of the leading fruit industries of California. Turkish statistics show that the annual production of Smyrna figs in Menderis Valley in Asia Minor is over 120,000 camel loads, each camel load averaging 600 pounds, making a total of 72,000,000 pounds. Of this output one-half is exported to the United States. The total output of figs from California is about 6000 tons, 1000 tons of which is of the Smyrna variety, which indicates that 80 per cent of the figs consumed in the United States is of the Smyrna variety.

As the industry grows there doubtless will be a constant increase in price of the Smyrnas. The price per pound ranges from five and one-half to seven cents at present whereas the Adriatic is bringing from three and three-quarters to four cents per pound.

The following table shows production of Smyrnas in different soils.

	Exceptionally Heavy Rich Soil. 40x40. 27 Trees to an Acre.....	Extra Heavy Rich Soil. 40 Trees to an Acre.....	Very Heavy Soil. 30x30. 48 Trees to an Acre.....	Medium Soil. 25x25. 69 Trees to an Acre.....

The above table is for Smyrna figs but it can be applied to the White Adriatic with the exception that the Adriatic comes into bearing maturity two years later.

the Cultivator Poultry Book

Poultry for Profit

by

Jean A. Koethen

PACIFIC POULTRYCRAFT SAYS:

A brand new book on poultry published by that old reliable Cultivator Publishing Co., Los Angeles. The author, Jean A. Koethen, has really written a poultry book worth while. The different subjects are treated with a directness that is refreshing after reading so many books that say so much and mean so little. The book is intended for the beginner and farmer, but we commend it most heartily to anyone interested in poultry; whether for pleasure or profit; it is full of good things from cover to cover.

THE LOS ANGELES TIMES SAYS:

The author of this manual has covered the subject fully, giving the salient features and practices of an enlightened poultry culture as it applies to California conditions, based largely on personal experiences, and intelligent compilations from recognized authorities.

THE RIVERSIDE PRESS SAYS:

The Press is in receipt of a copy of this work, called "Poultry for Profit," and has no hesitation in commending it to either the "backlotter" who keeps a few chicks for his own pleasure, to the fancier who works to the "standard," and to the commercial poultryman who makes a business of poultry culture. Before its publication, the manuscript of "Poultry for Profit" was submitted to practical poultrymen, to experts and simple poultry enthusiasts, and all agreed that it was more comprehensive, more readable and vastly more helpful than any similar poultry book yet published. It covers the widest range, discussing breeds, feeds, diseases, housing, marketing and answers the thousand and one questions that even the expert poultryman sometimes has to ask and the amateur is ever asking.

THE PORTLAND OREGONIAN SAYS:

The Weekly Oregonian takes pleasure in recommending this book to its readers, for it is "the right stuff," told in the right way by the right woman.

"Poultry for Profit"

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

An outline of its valuable information—

AN ATTRACTIVE BACKYARD

NOTHING adds to the attractiveness of the home like a well kept backyard, and nothing detracts so much as an ill-kept yard.

Many people seem to think that if they have the front yard clean and "primed" that it doesn't matter about the back part of the yard. It is often made a dumping place for the refuse that is not wanted in the front yard, which should be carried to the gullies, if there happen to be any. You often see the woodyard reach almost up to the kitchen porch or door and the chips kept well-soaked with the dish water.

I can't indorse these conditions. If any part of the yard is neglected, let it be the front yard. If one will adopt that rule, there will be no neglected yards, for one is sure not to neglect the front yard. A filthy backyard in summer is a menace to the health of the family and should not be tolerated. Buckets should be kept on hand to catch all the refuse water from the kitchen. These should be kept well covered in fly time. Where the dish-water is emptied in the backyard it makes a good breeding place for the flies. They will swarm over it for days.

The back yard can not only be kept clean, but it can be made really attractive. Most every farmer loves

THE GARDEN BEAUTIFUL

The Garden Beautiful is a jewel for this part of the country. One ought to be in every home; it is the long-needed inspiration the people have been seeking.—Wm. T. Shield, President Pasadena Horticultural Society.

flowers, but there are too many that do not take the pains that they should in growing them. We all love to pass a home and see beautiful flowers growing and blooming in the yard, or perhaps go into the home and see a pretty bouquet on the dining room table. Flowers help to keep the heart young and this is much to consider. We have often heard it said that the hand that loved to work with and handle the flowers was not lacking in human kindness. And we believe there is something to it. We farm folks are very busy during the crop time, and perhaps we think we haven't any time to devote to the growing of flowers, unless there is money in it, but it will pay to have flowers in the yard, at least.

For the back yard there is nothing prettier than the old fashioned roses. To me they are the most beautiful flower of all. To be sure they are fit to grace the front yard, but why can't we make the backyard beautiful too? Plant roses all around the edge of the yard as a background. They are easy to grow and will last a lifetime. Then have a bunch or two of the sweet-smelling honeysuckle. Make a small frame for these to run on and they are also there for years. Then we want a few flowers planted to grow from the seed. The sweet peas should not be left out. Then there are the old-fashioned pinks that grandmother used to grow in her garden.

If you have a back porch, plant morning glories and train them to a wire and see what a beautiful shade they will make. I am sure that every family will be happier and healthier by making their backyards clean and attractive.—Farmers' Guide.

Fallen leaves should be raked off the lawn and piled in some out-of-the-way place and allowed to decay. They are useful in the garden when well decayed.

DEVASTATING EELWORM

The devastating eelworm, or, to give it its scientific name, the *Tylenchus devastatrix*, has been found again in the Pacific Northwest several hundred miles from the point where it was discovered in 1913. This tiny thread-like organism is a member of the great family of nematodes and is remarkably destructive to many forms of bulbous plants. Commercially its chief importance is due to its ravages in onion fields, but it also feeds to a great extent upon flowering bulbs such as hyacinths and upon such crops as rye, oats, hemp, potatoes, strawberries, etc. This pest has proved extremely destructive in parts of Europe, particularly in Holland, and in Australia as well. Hitherto the United States appears to have been practically free from it, but the new infestation in the Northwest following upon that of two years ago indicates the existence of danger that it may establish itself here. The devastating eelworm thrives best in moist regions where the temperature varies to a comparatively small extent. These climatic conditions are found in Holland and in the areas in the Pacific Northwest where the pest has been discovered. On the other hand there is reason to believe that this particular nematode will not survive cold winters in which the ground is frozen solid for a considerable depth, or that at least it will not become a serious menace under such conditions.

The devastating eelworm is so small that although under the most favorable circumstances it may occasionally be detected with the naked eye it is practically certain to escape observation. As in the case of microbes its presence is usually made known only by its effects. The young nematodes hatching from eggs laid in the infested plant feed on the juices and tissues of the plant until it is destroyed. They multiply with extraordinary rapidity so that the bulb soon swarms with them, and they also often find their way into the upper leaves. In the case of the onion the leaves of the affected plants become swollen and flabby and the bulb soft and puffy. The whole plant has a peculiar stunted and distorted appearance, and ultimately the bulb rots away. If a portion of the bulb or one of the swollen leaves be placed in a dish of water and observed under a magnifying glass, tiny transparent worms may be seen escaping into the water. This is perhaps the most convenient method for the farmer to ascertain what is killing his onion crop.

Once a crop has become infested with these nematodes there is no known cure. In fact there is no known way of absolutely eradicating any of the soil-inhabiting, plant-infesting nematodes. The most effective measure is to starve the pest out either by allowing the land to lie fallow or by planting it to crops that furnish little or no nourishment to the eelworm. Corn and barley are among the crops recommended for this purpose. It is cheaper, however, to prevent the pests gaining a foothold than to fight them in this way. Any diseased plant should be uprooted and burned at once, and no bulbs or seed should be purchased from localities where the devastating eelworm is known to exist, for the pest is most commonly spread by shipments of infected bulbs and seeds. The eggs and larvae of this species of nematode have been known to revive after having been in a lethargic condition in the upper layers of the soil for years. Once a nematode has gained a footing in any locality it may spread in any number of ways. Running water, the feet of men and animals, and infected plant material blown about by the wind are among the most common means.

Closing Up Mortgage

I allowed quarterly interest on a mortgage to become overdue. The mortgagee with an idea of foreclosure traced up the title at an expense of \$7.50. I paid the mortgage and interest when due and have a letter written by mortgagee acknowledging check, but he refuses to send mortgage papers until I pay title fee of \$7.50. I have deed and clear title. What is best to do?—Subscriber, Orange.

As you have paid the mortgage and interest in full, it would hardly seem that a mortgagee was entitled to receive the additional amount for tracing title upon a foreclosure which never took place.

Liability for Polluted Water

Water is pumped from a well on an estate and a portion of it is sold to nearby neighbors for household and farm stock use. In case the water should become infected with typhoid or other disease germs and the neighbors are taken ill, to what extent is estate liable?—Subscriber.

There would hardly seem to be any personal liability unless through negligence upon the part of the well-owner the water became infected. It is declared unlawful to supply polluted water however. This refers only to such case when a person supplying the water knows that it is polluted. The matter may then be taken before the board of health for investigation of the plant.

Obstructing Highway

A owns house and lot. B rents a place by the month and conducts eating house. B builds house in the street and fences it. Can B hold street by possession or how can A proceed to open up right-of-way to his lot?—Subscriber, Los Olivos.

If a highway is encroached upon by fences, buildings or otherwise, the road overseer of the district may require the encroachment to be removed. The notice orders the removal within ten days from date of service of notice upon the occupant; if it is not removed, the one causing the encroachment forfeits \$10 per day for each day the same continues, and it is the duty of the overseer if the encroachment obstructs the road for vehicles to forthwith remove it. If the owner of the encroachment refuses to move, the road overseers must commence an action to abate the encroachment as a nuisance and also for the recovery of \$10 per day for each day it is maintained after serving notice. All penalties must be recovered by the road overseer or commissioner of the road district in the name of the county and be paid into the road fund.

Rental

A sold five acres of bare land to B. B did not pay his mortgage and the mortgage was foreclosed five months since. Can A attach anything, crops or real estate that B owns as payment for rent?—Subscriber, Chula Vista.

Where real property is sold at foreclosure sale defendant who remains in possession is a tenant in possession and liable as such to account to the purchaser for the value of the use and occupation. If the land is vacant the mortgagee is entitled to proceed to occupy the same and is entitled to use thereof, subject only to the right of redemption of the mortgagor.

Possible Slander

A cares for groves belonging to non-resident owners. B has been reporting that A is letting his groves suffer for want of care; that the pumps have not been kept running, etc. How can A protect himself?—Subscriber.

If A has lost any contract by reason of the untruthful statements of B he may bring action against B for the amount which he would have received under that contract if he had been enabled to carry it out. The statements may possibly approach the law of slander, but slander is quite difficult to prove.

Right to Water

A has an artesian well on his ranch and allows his neighbor, B, to erect a tank at the well and attach a pipe through which some water is carried to B's house, some distance, free. Does the arrangement ever become a

fixed attachment? If so, after how long a time?—Subscriber.

Five years is the period necessary to acquire a right by prescription in or to real property. The mode commonly taken to evidence the fact that a mere license is granted is to at least once a year for a day discontinue the use. In this case it would be either advisable to shut off the water once a year for a day or to have a contract drawn whereby the party receiving the water admitted that he had no right thereto, other than the gift of the owner of the property.

School Districts

A is a school district, B is another district adjoining. A votes bonds and builds a new school house, B by the sanction of the county superintendent of schools and by an act of the board of supervisors some eight or nine years ago took a one-quarter section off A and annexed it to B, and

again about two years later took another quarter section. The excuse was that children living on said land were nearer to B than to A. Can A collect from B the amount of taxes due on bonds and how far back? What would be the procedure to collect the same?—Subscriber.

In a question such as the above, which rests peculiarly upon the exact facts, which are necessarily stated incompletely, it would be advisable to take the matter up with the district attorney or county counsel of your county, who would be in a position to give thorough and accurate consideration of the matter without cost to you and which would be far more satisfactory than any mere guess which could be given here upon the incomplete data furnished.

To stay young some put lotions on to the skin; while others, wiser, put comfort into the hearts of their fellow men.

Save Money on Wire Fencing!

-send for WHITING-MEAD'S Free 1915 catalog showing how to save 20% to 40% on Building Material

Warner Fencing \$4.10, \$4.90, \$5.55 per Roll, for Stock and Poultry

This class of fencing is known all over the country and usually sells for considerably more. First placed on the market some ten years ago to meet the demand for a substantial combination stock and poultry fencing.

It is closely woven and made of No. 14 galvanized wire, the spaces between the wires being graduated from the small mesh at bottom to keep chickens in, to the regular stock fence mesh at top. Has heavy cable edge at top and bottom, which enables it to withstand sudden shocks without injuring the fence.

Ten rods to roll and sold in full rolls only.

Height inches	Approx. Wt. per rod	Stays inches	Bars number	Price per roll
35	7	6	15	\$4.10
45	8	6	17	4.90
55	9.2	6	20	5.55

POULTRY FENCING \$3.25, \$3.60, \$4.30, \$4.90 PER ROLL—GRADUATED MESH—GALVANIZED

Has many advantages over the ordinary poultry netting, being three times as strong, does not require a top or bottom board, as the selvege wire at top and bottom may be stretched to give perfect close fit to ground, and the top affords no place for chicken to rest.

All the features of the popular heavier fencing, including the interlocking mesh, with special graduated mesh to keep small chickens in. Sold in full rolls. 3 ft. high, \$3.25; 4 ft. high, \$3.60; 5 ft. high, \$4.30, and 6 ft. high, \$4.90.

WARNER HOG FENCING \$5.00

Specially woven hog fencing, with barb wire selvege at bottom, which effectually prevents hogs raising the fence, and does away with the necessity for and expense of bottom boards.

Made of best quality No. 14 galvanized wire, height 26 inches; weight per rod 4.5; stays, 6 inches; with 7 bars barbed at bottom. Sold in 20-rod rolls only, \$5.

POULTRY NETTING 45c, 60c, \$1.10

GALVANIZED—2 IN., 1½ IN., and 1 IN. MESH.

A great special buy, amounting to almost a full carload, in these much wanted sizes. Remember, it's all perfect in every way.

1 in. mesh, \$1.10 per 100 sq. ft., 18, 24, 36 and 48 inches high. 1½ in. mesh, 68c per 100 sq. ft., 24 inches high only. 2 in. mesh, 45c per 100 sq. ft., 18, 24, 36 and 72 inches high.

These prices will apply only so long as this lot remains in stock, so get your orders in early as they will be filled subject to stock on hand.

FENCE STRETCHER AND COMBINED HOIST \$1.25

A most necessary tool in erecting wire fences and very handy to have on the farm at all times.

May be used as a lifting hoist, similar to block and tackle, has automatic catch which holds wire or load at height required. Thousands in successful use. Two sizes, \$1.25 and \$1.50 each.

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet	\$1.15
2-ply, double-sanded, per roll of 108 square feet	\$1.40
3-ply, double-sanded, per roll of 108 square feet	\$1.65
1-ply "King" smooth, per roll of 108 square feet	\$1.25
2-ply "King" smooth, per roll of 108 square feet	\$1.50
3-ply "King" smooth, per roll of 108 square feet	\$1.75

Send for free sample. Remember we ship direct to you.

Everything in New Building Material for Less

Building, New York.
C. A. Cour, Globe Bldg.,
St. Louis, Mo.Entered at the Post Office at Los An-
geles, California, as Second-Class Matter.**Thursday, Dec. 30, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**1916 ORANGE DAY**Plans are already in the mak-
ing for a more general observation
of Orange Day for 1916. It is prob-
able that Orange Day in 1915 in-
creased the consumption of oranges
during that season by many hundreds
of carloads. It gave opportunity for
department stores and large gro-
ceries to feature displays of oranges,
and as we buy with our eyes, it re-
sulted in greatly increased demand.
The Exchange is doing some mag-
nificent work along publicity lines.**BEFORE THE GRAND JURY**Stanislaus has its grand jury
investigating as to the control of
weed pests in that county. County
Horticultural Commissioner Ruther-
ford has been doing some efficient
work in his fight against Russian thistle,
sand bur and Spanish cocklebur
and is appealing for power to do still
more.Grand juries have been used to in-
vestigate many abuses; we do not
see why they cannot investigate what
rights the cockleburs have in Stani-
slaus County.**LESS WHEAT**Reports from the bureau of
crop estimates of the department of
agriculture indicate that there will
be less winter wheat grown than last
year by 11.3 per cent. Very few
states will equal their last year's out-
put and those that have incresed
their plantings will be the smaller
producing states. New Mexico, for
example will plant 30 per cent more
wheat than last year; Missouri and
Nevada each show a planting of 120
per cent of last year's. The present
indications are that there will be
about 42,000,000 bushels planted over
the United States.**OLEOMARGARINE**The National Dairy Associa-
tion, an organization formed to pro-
tect the dairy industry from fraud-
ulent sales of substitutes for dairy
butter, is continuing its fight for pure
food products. The great contention
between the manufacturers of oleo-
margarine and the dairy people is the
coloring of oleomargarine. The nat-
ural color of oleomargarine is white,
and the natural color of butter is yel-
low, and when oleo is colored in imi-
tation of yellow butter it brings from
five to 20 cents a pound more than
when it is uncolored. The coloring
yellow of any imitation, or substitute
for butter, is done for the purpose of
using this trademark and to make de-
ception possible. The dairy cow can-
not stand against this unfair compe-tion than ever before is on the way.
A still more ambitious plan that was
broached at the last state fruit grow-
ers' convention was for a federation
of all cooperative marketing organi-
zations. Therefore in cooperative
marketing fields, with such a leader
as Commissioner Weinstock, there is
promise for a brighter new year for
California producers.Speed the day when we may all be
joined in an effort to secure just
treatment to the producers.**INDEX**Volume XLV of the California
Cultivator is completed. It is a vol-
ume of permanent value. Material is
given on the citrus industry which
can be found nowhere else. Some of
the best culturists of the state have
written new "copy" of great value on
deciduous trees and vines. Many
special articles on potatoes and other
garden and field crops may be found.**TO OUR FRIENDS**ADVERTISING is a subject to which few readers give sufficient
thought, and yet it is of vital importance to them considered
from an educational standpoint alone.Do you realize that men are paid from \$10,000 to \$50,000 a
year for their ability to write advertising copy?You will find some of this splendid ability shown in the columns of
the California Cultivator, and we wish to impress upon you the fact that
there is interesting, instructive and beneficial reading to be found in
our advertising columns. Of course we know there are a lot of subjects
discussed there that may not interest every reader; on the other hand,
there is not an issue that does not contain an advertisement that will
give you some new idea, add to your comfort, and in all probability save
you money. For this reason it is to your interest that you pay some
attention to these columns.In the advertising columns you find the story of the world's com-
mercial progress. Ninety per cent of all the new inventions are first
brought to public notice through advertising.We want every reader to take an interest in the advertisements
appearing in the California Cultivator because they help to provide the
financial support of this paper. All these advertisers are first class busi-
ness concerns which have been investigated and are guaranteed by the
publisher. Buy their goods whenever you can; it will be appreciated by
us if you mention this paper.That we have faith in our advertisers is shown in the short item on
this page "Our Advertisers Reliable."tition for "where substitution is pos-
sible, competition is impossible."**THE NEW YEAR**It is natural to look into the
new year with hope that it holds for
us more of prosperity and happiness
than has the past year, and while
there are a few who are naturally of
a pessimistic turn of mind, the
greater number of us prefer the
brighter outlook, and fortunately the
world is growing better and more
prosperous year by year and our ex-
pectations have some degree at least
of realization. It is true we look at
some conditions as they are today in
other countries and ask, "Is the world
really growing better?" But brought
closer to our own home, we believe
this question readily reveals an affir-
mative answer. Financially there is
certainly a brighter outlook on New
Years Day of 1916 than there was 12
months ago. Brought to our own
state, one proof that this is the case
is the more general determination to
stand together in marketing our
products.The Cultivator has preached coop-
eration in season and out of season
and has much of happiness in the fact
that with a state marketing commis-
sion, with olive men organizing, with
peach growers having already prac-
tically completed plans of organiza-
tion, with the bean growers of Ven-
tura and Orange Counties getting to-
gether, with the prune men, while not
completely organized having commit-
tees at work and an understanding
with each other which has been of
wonderful benefit during the past
year, with the cooperative canneries
affiliating and seeking their own re-
tail market, more effective coopera-The ornamental garden department
has been eagerly looked forward to.
One of the best features of this de-
partment and of the vegetable garden
department is the planting calendar
given in the first issue of every
month. This feature will be continued
another year. The live stock indus-
try has been given much attention
and has been especially well illus-
trated. Articles in the poultry de-
partment have called for many com-
pliments because of their most prac-
tical nature. The household depart-
ment has featured a series of contests
for subscribers which has brought in
hundreds of valuable recipes and
hints which are preserved in this vol-
ume for those who file their Cultiva-
tors. The popularity of the legal
department has been shown by the
ever increasing number of questions
coming to it. The veterinary like-
wise is proving most helpful, espe-
cially to those who are not accessible
to a practicing veterinarian. A glance
over the index which appears on
Pages 654 and 655 will show the great
amount of valuable matter which may
be made of permanent value to our
subscribers if they have saved their
copies and file with this index.
Scarcely a mail comes to this office
but has a question for our question
and answer department which has
been answered in a preceding num-
ber, and these are answered by send-
ing to the inquirer former copies.
With the aid of this index these ques-
tions may often be answered immedi-
ately without the necessity of delay
caused by writing to this office. Not-
withstanding, we again extend most
hearty invitation to all to avail them-
selves of the Cultivator's help in any
problem to which we can possibly
secure the answer.Illustrations appearing during the
year are also indexed for quick refer-
ence. These illustrations are of par-
ticular interest because so many have
been taken on the ground by our staff
photographers and give at a glance
information that perhaps could not be
so clearly given in a column of read-
ing matter.**Agricultural Notes**Nine million pounds of dried vege-
tables are being contracted for in
New York for the use of the French
army.Australia has 100,000,000 bushels of
wheat for export this year; now the
problem is to secure boats for trans-
portation.A decree of November 22 prohibits
the exportation from France of grape
residue, walnuts and other nuts, al-
monds and fruit stones.Japanese rice has formerly been
marketed chiefly in the United States
and Hawaii; this year Great Britain
is a close second as rice buyer.Chile is experimenting with grow-
ing sugar cane in various sections. It
is hoped that the sugar industry may
be developed to good proportions.Preliminary figures compiled by
statistical authorities show that the
European beet sugar crop for the
1915-16 season will show a reduction
for Europe, as a whole, of 20 per cent.Western Australia has undertaken
the conduct of many transportation
lines and business industries. The
premier reports that the state steam-
ers showed a loss of \$35,000, the saw-
mills a profit of \$135,000.Owing to the large crop of Canad-
ian plums and peaches this year the
Canadian government through the
fruit branch of the department of
agriculture conducted an advertising
campaign in the daily and weekly
newspapers.Due to war conditions, American
sugar exports in the year ending May
30, 1915, increased over 1000 per cent
in value and 900 per cent in volume,
while the net gain per ton in the
prices received by the exporter in-
creased over 25 per cent.The state of Pennsylvania has a
new workmen's compensation law,
and at a conference of the state board
with railroad officers in Philadelphia
recently, all of the principal railroads
of the state announced their intention
of accepting the provisions of the law.The college of agriculture of the
University of the Philippines, the
only large agricultural college to be
found in the tropics at present, is in
its sixth year, and has a student body
of nearly 400. It occupies a large
tract of land on which every impor-
tant crop in the Philippines is under
cultivation.Because much of the land usually
planted to tomatoes in Italy has this
year been put in corn by orders of
the government to insure war sup-
plies the Norwegian fish packers who
formerly packed their fish in Italian
tomato sauce are inquiring into pos-
sibility of securing this tomato sauce
from the United States.The bacteria which cause citrus
canker are capable of living in the soil
after the infected citrus trees have
been destroyed. This fact has been
brought out by investigations of the
plant pathology department of the
Florida experiment station and by
observations of the employes of the
state plant board. "In view of this
dangerous phase of citrus canker in-
fection," said Mr. Newell, "the state
plant board prohibits the planting of
crops of any kind on ground where
citrus canker has occurred, until such
time as the board considers the land
free from danger of the infection by
the canker organisms. Land where in-
fected trees have grown should not
even be passed over or entered by
people or livestock."

Agricultural News Notes

of the Pacific Coast

Northern California

The newly formed Peach Growers' Association has been holding meetings in Solano County.

The Vacaville Fruit Growers' Association, at its recent annual meeting elected T. H. Buckingham president.

The Berkshire Swine Breeders' Association is planning a sale at the Sacramento fair grounds in the near future.

The 1916 convention of the California Creamery Operators' Association will be held in Ferndale, Humboldt County.

The establishment of a cannery at Oroville for fruits and vegetables is being considered by the California Ripe Olive Company.

This year's production of rice for the state is estimated at over 50,000 tons. Butte County alone has produced about 500 sacks this year.

Orange growers of Butte County have appointed a committee to carry on the campaign against the eight-to-one maturity test for tree-ripened fruit.

Growers of many districts in Butte County are taking active interest in the proposed plan to plant more largely to the same shipping varieties of deciduous fruits.

There will be a potato meeting at Sebastopol January 29, held under the direction of State Horticultural Commissioner Cook. Decline of crops will be the subject of discussion.

The Humboldt County Dairymen's Association, at its last monthly meeting in Ferndale, appointed a committee to ask the county supervisors for the appointment of a veterinarian.

The petition for the formation of an irrigation district at Paradise, Butte County, has more than the required number of signatures. This proposed irrigation district will take in 10,000 acres.

The Solano County farm bureau, through Farm Adviser J. W. Mills is asking for the stationing of a government agent in the district between Dixon and Montezuma to give particular attention to rice and vegetables.

The Sacramento Valley Development Association, which is starting a fight against the water grass pest in the rice fields, has drawn up ordinances for suppressing the pest for submission to the various boards of county supervisors.

Short course students in dairy manufacture at the university farm at Davis have organized an association to be called The California Dairy Manufacturers' Short Course Alumni Association. It is planned to hold an annual meeting of this association at Davis during each short course.

The state water commission announces that it has appropriated \$1500 for the study of the use of water in rice growing in California. The investigations will be conducted by Frank Adams, irrigation expert of the United States department of agriculture. The department will also join in providing funds to conduct the investigation.

Central California

The Merced creamery paid out over \$8000 for butter fat during the month of November.

The Miller & Lux vs. Stevenson irrigation case, which has been in the courts for many years, now faces a fourth trial.

The Central California Cattlemen's Association has passed a resolution offering \$1000 reward for the arrest and conviction of cattle stealers.

The Turlock and Modesto Irrigation districts are considering a proposal to unite in building a storage reservoir on the Tuolumne River.

Orange growers of the San Joaquin Valley expect to ship out 4200 carloads for the season. Most of the crop was sent out in time to catch the Christmas trade.

The Central California Cattlemen's Association is planning a membership campaign which will materialize in the organization of members owning at least 25,000 head of stock.

The board of supervisors of Tulare County has passed an ordinance providing for the inspection of all grape vines coming into the county to prevent admission of phylloxera.

A half million dollar corporation has been organized to develop a dairy farm on the old Gray Brothers' ranch east of Oakdale in Stanislaus County. The stock will be Holsteins.

The California Wine Association has announced that it will settle for all Zinfandels delivered to them on a ten-dollar-a-ton basis, the first installment to be paid any time after January 1.

County Horticultural Commissioner Roullard of Fresno County states that the cost of inspecting green fruit under the new standardization act which went into effect on August 9 was over \$3000 to Fresno County.

The central committee of the California Peach Association has appointed a committee to consult with bankers to arrange for a general meeting of the clearing house association to consider the plans of the association.

More than 90 cows belonging to members of the Stanislaus County Cow Testing Association have exceeded 45 pounds during the month of November. A Guernsey owned by Joseph Longley of Hughson leads with a production of 82.2 pounds butter fat.

A number of arrests of cattle thieves have been made in Kern County recently. These arrests will be prosecuted by the Central Stockmen's Association. This association has for its purpose the protection of cattle of members from thieving and extends its operations over six counties.

Four carloads of oranges were sent from Merryman, Tulare County, a few days ago, loaded in cars fitted with an electric wiring system to furnish artificial heat. The cars were designed and the oranges packed under direction of experts of the bureau of plant industry of the United States department of agriculture.

Southern California

The Fontana Poultry Association has taken out articles of incorporation.

The Olive Hillside Groves Association of Orange County shipped out 73 carloads of oranges last season.

The cotton growers held a meeting at Brawley in connection with the Agricultural Assembly December 18.

Sierra Madre has passed an ordinance requiring owners of one cow to pay a dairy license if they sell milk outside the family.

The La Habra Citrus Association is building an addition to its packing plant. This with the new machinery installed will cost \$30,000.

The Ventura County Dried Fruit Association is making its final payments to members for the 1914 crop. Much of the 1915 crop is still in warehouses.

The Orange County Poultry Fanciers' Association will hold its annual show at Santa Ana January 18-22. A number of valuable prizes are announced.

Plans for the main buildings on the new citrus experiment station grounds at Riverside have been approved by the university. These buildings will cost over \$100,000.

Rialto has been assured that for the time being at least it will not lose its rural delivery route. Announcement had been made that the rural route would be discontinued the first of the year.

According to the Oxnard Courier bean growers have decided to eliminate the 80-pound bean sack so long used for marketing limas and other varieties and beginning next year will use nothing but 100-pound sacks.

The Associated Chambers of Commerce of Orange County have decided to have a county exhibit at the National Orange Show at San Bernardino in February. Each chamber of commerce will be represented by one member on the exhibit committee.

The Agricultural Assembly brought a great influx of visitors to Brawley. This farm assembly is to become a permanent feature of Imperial Valley's agricultural industry. There will be a series of meetings in every section of the county during February.

The San Antonio Growers' Association has adopted constitution and by-laws for a permanent organization of deciduous fruit growers in the district between Pomona and San Bernardino. This organization will erect two packing houses and a dry yard, one at Ontario and one at Chino.

Representatives of bean growing districts of Ventura County met at Ventura Saturday, December 11, and drafted by-laws for the proposed organization of bean growers. These will be submitted to the warehouse district units for approval and membership signature. It was decided that all growers be asked to sign a five-year contract with the association.

The Coast

Several sales of hops are reported in Portland at 11½ cents.

The Northwestern apple market seems inclined to stay down.

Preparation is being made for many plantings on the Yuma project.

The University of Arizona will hold its annual short course for farmers January 3-15.

Many plantings of walnuts are being made in the Wenatchee district of Washington.

Fruit growers of Hood River, Oregon, won nine gold medals at the Panama-Pacific.

The Arizona Cattle Growers' annual convention will be held at Prescott January 10-12.

The National Wool Growers' Association will convene at Salt Lake City, Utah, January 13-15.

The Mesa Poultry and Pet Stock Association will hold its annual show at Mesa, Arizona, January 20-22.

The Idaho State Poultry Association will hold its annual show in Moscow the week of January 24.

It is rumored that many changes are to be made in the apple marketing associations of the Northwest.

The convention of the National Live Stock Association will be in session at El Paso, Texas, January 25-27.

During the farmers' short course to be held at Tucson the Arizona Irrigation Conference will hold its second annual.

Denver, Colorado, will be the scene of the National Western Stock Show. The show will be on from the 17th to the 22nd of January.

The Arizona Cattle Growers will convene at Prescott January 10. President Heard of the National Cattle Growers' Association will be present.

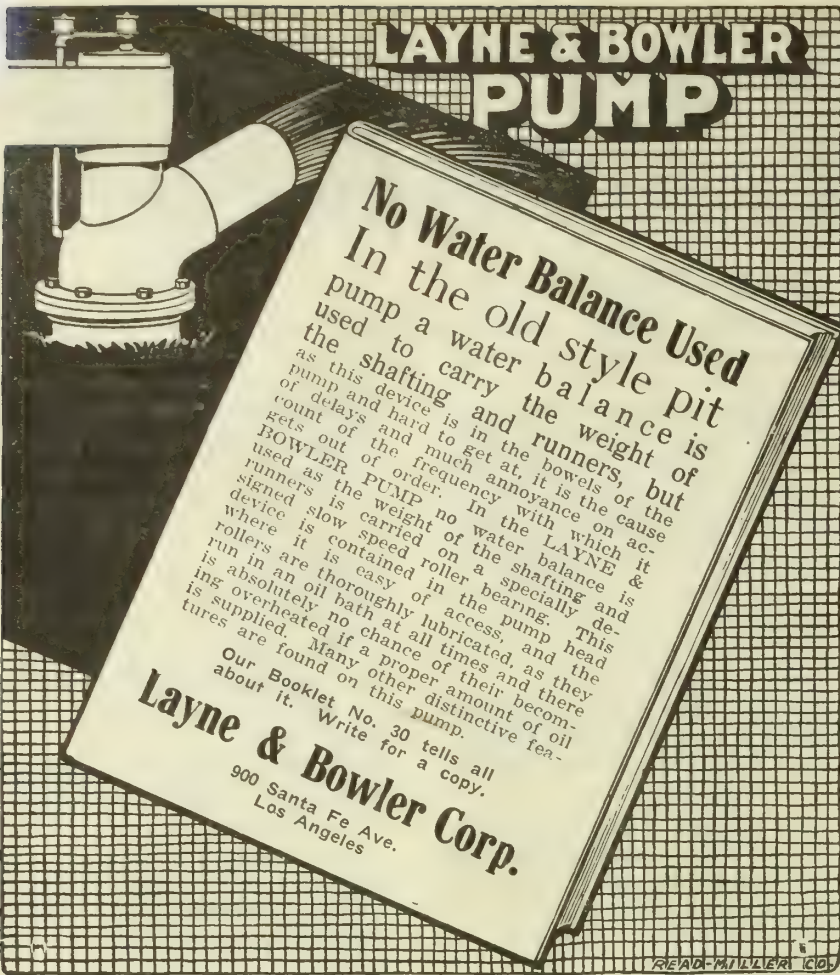

Livestock raisers in the Chandler district of Arizona met December 18 to discuss formation of an organization to obtain better market prices to the grower.

Farmers of the Salt River Valley of Arizona are being assisted in their fight for better market prices by the County Farm Improvement Associations and commercial organizations of business men.

Berry growers of the Puyallup Valley of Washington are making poultry raising a side line. They are planning to handle their poultry product through their berry associations' selling organizations.

Farmers of Maricopa County, Arizona, have shipped out ten carloads of sour clover seed to California this season. Farm Adviser Armstrong is credited with calling the value of this seed to the attention of farmers. It was formerly regarded a waste product.

The Arizona Farm Improvement Association is suggesting to bean growers of the state that they get together and store their beans in a warehouse in the community and market in larger lots, as it is difficult to find sale for a few bags here and a few bags there.

LAYNE & BOWLER PUMP

No Water Balance Used In the old style pit pump

used to carry the weight of the shafting and runners, but as this device is in the bowels of the pump and hard to get at, it is the cause of delays and much annoyance on account of the frequency with which it gets out of order. In the LAYNE & BOWLER PUMP no water balance is used as the weight of the shafting and runners is carried on a specially designed roller bearing. This device is slow speed and head run in an oil bath at all times and there is absolutely no chance of their becoming overheated if a proper amount of oil is supplied. Many other distinctive features are found on this pump.

Our Booklet No. 30 tells all about it. Write for a copy.

Layne & Bowler Corp.

Los Angeles

Live Stock and Dairy

PRICKLY PEARS FOR DAIRY COWS

THE prickly pear, specialists of the United States department of agriculture say, has now been demonstrated to be a good and palatable feed for dairy cows. They have been fed in Texas and Mexico for many years, but their value has not been fully appreciated. Recent experiments by the department of agriculture have shown, however, that this feed can be used much more extensively and can form a much larger proportion of the ration than was believed possible heretofore.

There is no reason why prickly pears should not come into general use for feed in all sections where they can be readily grown. Under proper climatic and soil conditions the prickly pear is a perfectly practicable farm crop. At Brownsville, Texas, the average annual yield for the first two years' growth from cuttings was about 40 tons, and at San Antonio about 25 tons an acre. After the first two years a yield of 50 to 100 per cent more can be expected. Irrigation is unnecessary and the cost of growing the crop is therefore small in comparison with the tonnage produced.

The prickly pear, it is found, contains approximately ten per cent of dry matter, the remainder being water. If it is assumed that the nutritive values of the different kinds of feed vary in direct proportion to their content of dry matter, one pound of sorghum hay equals 15.9 pounds of prickly pear when the latter is fed in large quantities, and 10.1 pounds when fed moderately. One pound of sorghum silage was found to equal two and six-tenths pounds of prickly pear and one pound of cottonseed hulls equal five and eight-tenths.

From 60 to 100 pounds of prickly pear, three and six-tenths of sorghum, and one of cottonseed meal a day made a maintenance ration for a Jersey mature cow when dry. If no sorghum hay is available the amount of prickly pear should be increased to 110 pounds and the cottonseed meal to two pounds. Experiments show, however, that it is best to feed not more than 60 to 75 pounds of prickly pears a day. When 120 to 150 pounds were fed, excessive scouring followed, and in addition the laxative effect of the feed made it extremely difficult to keep the stable in a sanitary condition.

In general it may be said that cows like prickly pear and eat it with relish. The feed, according to the experiments, causes an increase in the quantity of milk produced but a slight decrease in the total production of butter fat. This decrease becomes more pronounced as the quantity of prickly pear in the ration is increased. Butter produced on a prickly pear ration is highly colored but neither its flavor nor the keeping quality of the milk is noticeably influenced. From the experiments it is noticed, however, that cows fed upon prickly pears appear to be more sensitive to "northers" than those which receive a dry roughage. The greater the quantity of the plant consumed the more the milk production fell off during these storms. On the other hand the feeding of prickly pear appeared to have no influence on the offspring of the cows nor on the condition of the mothers after birth.

The cost of feeding prickly pear will depend naturally on local conditions. There is no great difference between the spiny and the spineless varieties in their values as feed, but the cost of harvesting the latter is less. On the other hand the spiny varieties yielded a larger tonnage to the acre in Brownsville and are not so susceptible to insect depredation. They are also more hardy and can be grown on a much larger area. The cost of singeing the spines off was approximately 50 cents a ton. The

most common method of removing them is by singeing with a strong gasoline torch, a machine specially constructed for this purpose being on the market.

BALANCED DAIRY RATIOMS

Most feeders of dairy cows can produce protein more cheaply than they can buy it, according to C. H. Eckles of the dairy department of the Missouri college of agriculture. Wise is the man who has a good supply of legume forage on hand from his alfalfa, clover, cowpea, or soybean fields, for the dairy cow cannot do her best on corn, timothy hay, or fodder even with good succulent silage to help maintain summer pasture conditions.

Bran at a dollar a hundred furnishes protein at a cost of about eight and a half cents a pound, while cottonseed at \$1.90 per hundred furnishes it at a cost of little over five cents a pound. The cost of producing the protein on the farm in alfalfa, clover or other leguminous crops varies with local conditions so that no such definite figures can be given, but almost any farmer should be able to supply himself at much less than five cents a pound. If he has neglected to do so, however, he must purchase protein in some form to supplement the abundance of silage and corn which he undoubtedly has on hand under Missouri conditions.

Feeding two pounds of cottonseed meal a day to a cow that has been giving milk on such a ration as corn, fodder, and timothy hay will increase the flow to a surprising degree. In spite of the many things that have combined to raise the price of cottonseed meal this year, it is probably the cheapest concentrate to buy for this purpose.

Some good dairy rations which Professor Eckles suggests in Missouri agricultural experiment station Circular 44 are:

(1) Corn silage	25 lbs.
Clover hay	10 lbs.
Corn	4 lbs.
Bran	4 lbs.
(2) Corn silage	30 lbs.
Alfalfa or cowpea hay	10 lbs.
Corn	6 lbs.
Bran	2 lbs.
(3) Clover hay	20 lbs.
Corn	4 to 5 lbs.
Bran or oats	2-4 lbs.
(4) Clover hay	20 lbs.
Corn and cob meal	5 to 7 lbs.
Gluten or cottonseed meal	2 lbs.
(5) Alfalfa or cowpea hay	10 lbs.
Corn fodder	10 lbs.
Corn	5 to 7 lbs.
Bran	2 lbs.
(6) Alfalfa or cowpea hay	15-20 lbs.
Corn	8-10 lbs.

Each of these rations includes a whole day's feed for the ordinary cow, half to be given in the morning and the other half in the evening, but they are not intended for the cow of unusual dairy capacity or one that is being fed for heavy production or to make a record. The amounts specified are those to be fed to a cow giving from 20 to 25 pounds of milk a day, and cows giving more than this should receive more feed, especially more grain, while those giving less milk should have the grain cut down. The general plan followed is to give each cow all the roughage she will eat and about one pound of grain for each three pounds of milk produced.

BABY BEEF

A creep should be provided in the pasture so that calves may have access to grain without being disturbed by cows, as it is very important to start beef calves on grain before they are weaned. They may be kept in a separate lot into which the cows are turned twice a day if this method is preferred. In this case there will of course be no need for creeps or anything else to keep cows from the grain which may be fed at

First Annual Auction Sale of Purebred Hogs

under the auspices of the

California Swine Breeders Association

will be held at the

State Fair Grounds, Sacramento, Cal.

on

January 27, 1916

100 head of pure bred hogs of various breeds will be sold. These represent the tops of some of the best herds to be found in California. All hogs sold will be registered and will be guaranteed breeders by the consignors. The catalogs will be ready about January 12th, and can be secured of

Made from the right crude

The Jury of Awards at both San Francisco and San Diego Expositions found an oil made from California asphalt-base crude, highest in lubricating efficiency. That oil was Zerolene. The fact, too, that such unbiased authorities as a U. S. Naval Engineer, engineers of the Packard and Ford Motor Companies, and others, have also gone on record in favor of oils made from asphalt-base crude—in accord with the decision of the Exposition juries—proves that Zerolene is made of the right crude, and made right.

BLACK LEG

LUSSIES SOON PREVENTED by Cutter's Blackleg Pills. Low-priced, fresh, reliable; preferred by Western stockmen because they protect where other vaccines fail. Write for booklet and testimonials. 10-dose pkg. Blackleg Pills \$1.00. 50-dose pkg. Blackleg Pills 4.00. Use any injector, but Cutter's best. The superiority of Cutter products is due to over 12 years of specializing in vaccines and serums only. Inlet on Cutters. If unobtainable, order direct. **THE CUTTER LABORATORY, Berkeley, California.**

such times that the cows will not disturb the calves.

The calves may be started on a mixture of two parts of shelled corn to one part of oats by weight. The oats may be gradually reduced until none is being fed at the end of eight weeks, but while this is being done a little old process linseed oil meal or cottonseed meal should be added and the quantity gradually increased until it makes up about one-seventh of the weight of the ration. On full feed calves should eat about two pounds of grain for every hundred pounds live weight in addition to good roughage. Wellbred calves handled in this way should be in prime condition at the end of about ten or twelve months.—H. O. Allison, Missouri College of Agriculture.

PRODUCTION OF SILAGE

On cover page may be seen photograph of two silos on the ranch of Frampton Brothers at Artesia. On this page is given another photo of the field from which the silage was secured, which surely shows a magnificent growth of corn. Both these photos were taken by Mr. E. W. Cochems of Hynes. The local paper commenting upon the Framptons' production says:

"We challenge the world to equal Artesia in the production of corn to the acre. We believe that the Frampton Brothers grew more corn to the acre than has ever been grown anywhere by anyone. They harvested 330 tons of corn from 964 acres, filling two concrete silos 14 feet in diameter and 41½ feet high, letting the ensilage settle and refilling till the silos were entirely full of settled silage. The silo books recommend 12 acres of corn to fill one such silo.

"Not only was there such a growth of stalk reaching 18 feet high but the grain was very heavy—most of the stalks grew two ears of corn, well filled and averaging 12 inches in length with the lower ear sometimes reaching 11 or more feet from the ground—a wonderful exhibit of what Artesia land, water and climate can produce when properly united.

"This is not a freak crop, as Mr. Frampton says he is willing to back up his assertion that he can at least duplicate the yield on the same land another year."

POTATOES AS HOG FEED

Because of the surplus of white or Irish potatoes now on the market and the consequent low prices many farmers have been seeking information as to the possibility of feeding them to hogs.

Many experiments have been conducted in Germany and other foreign countries as well as a few in the United States to determine the value of potatoes as feed for swine. In Ireland and Germany farmers feed large quantities of potatoes annually. From experimental data it has been concluded that four to four and a half bushels of potatoes when cooked are equal to about one bushel of corn for putting gains on hogs. Therefore if corn is worth 80 cents a bushel, potatoes when fed to hogs would be worth only 18 to 20 cents a bushel. There may however be instances where it would be more advantageous for the farmer to feed to hogs right on his own place at least part of his crop rather than to haul these potatoes to an already overloaded market.

According to the consensus of opinion potatoes are fed to the best advantage when cooked or steamed and mixed with other feeds. Experiments in which raw potatoes were fed alone have been reported. In certain instances the raw potatoes are said to have caused scours. However raw potatoes in small quantities and in a diet lacking succulence may be conducive to health in pigs.

In cooking potatoes only enough water should be used to make a mealy mash and prevent burning. The resultant meal should then be mixed with corn meal or other grain supplement. Tankage, skim milk, or meat meal would probably add to the profit of the mixture. Potatoes when pre-

pared in the manner described and under the conditions mentioned can often be fed to pigs with advantage.

A CURE FOR BLOAT

Recently it has been found that formalin is an efficient remedy for animals suffering from bloat. This should be given as soon as possible after the animals are noticed to be in pain and the left side greatly distended. Ruminants, such as sheep and cattle, are most frequently affected. Cows should be drenched with one quart of water to which has been added 40 cubic centimeters of formalin—this is one-quarter of a cup, or about three tablespoons. One-fourth of this amount is sufficient for sheep. Relief usually comes inside of 20 minutes, and there are no bad effects follow-

ing, such as the results from the use of the trocar and canula, or "sticking" with a knife.—R. H. Williams, Animal Husbandman, University of Arizona.

AS TO WOOL

Some printed statements convey the impression that the entire fleece goes into the production of a garment, so that the amount of finished cloth is equal to the amount of scoured wool. This impression is erroneous. A number of tests reported by different mills show that for woolen goods from four pounds to four and sixty-four hundredths pounds of grease wool were required to make one pound of cloth. For worsted cloths from two and fifty-six hundredths pounds to four and fifty-five hundredths pounds of grease wool was required.

SUNFLOWERS

Frequent inquiries are received at the Washington experiment station concerning the growing of sunflowers. Dr. Cardiff, director of the experiment station, gives the following information on this plant as an agricultural crop:

The sunflower is an important agricultural crop, though it has not been used to any great extent in this country. It is cultivated quite extensively in Russia and used for a variety of purposes. It makes excellent silage, especially when mixed with corn and some legume in about equal parts of each. The seed has an unusually high oil and protein content. On account of the latter its growth rapidly exhausts the nitrogen from the soil and, therefore, if grown successively on land, the soil will require considerable fertilizer. The oil portion does not exhaust the soil since the elements from which oil is made come from the air and water.

The seed is used in the production of oil, which is extracted by compression, and is of value for table use, cooking purposes, and in general the same use as is made of olive oil.

In Russia the seeds of the larger seeded varieties are sold as peanuts and are in this country, and eaten raw.

Health First

If a cow is well—if her organs of production are doing their duty—she will yield well. Time was when the cow that became sluggish and seemed to be going backward was promptly sold to the butcher.

Thousands of cow owners have found that in most cases proper treatment will save them the difference between the price of a beef cow and a vigorous milch cow.

Most dairy cow ailments are simple if the source of the trouble is reached. If the organs of production or reproduction are not doing their duty, try Kow-Kure—the medicine for run-down cows. It has worked wonders in many herds, and is especially recommended for the prevention and cure of Abortion, Barrenness, Milk Fever, Scouring, Lost Appetite, Bunches, Retained Afterbirth, etc.

Keep Kow-Kure on hand constantly. Sold in 50c. and \$1.00 packages by feed dealers and druggists.

Dairy Association Co.

BUTTER SCORING CONTEST

The sixth and last entry of the 1915 educational butter scoring contest was scored in San Francisco, December 21. Interest in the contests has kept up remarkably well during the whole year and at this last scoring there were entries from 21 creameries. A good percentage of these buttermakers have taken part in the entire year's work regardless of the unfavorable conditions which existed when one or two of the entries were called for. The scoring of the current entry was done by T. J. Harris, official inspector of the San Francisco Wholesale Dairy Produce Exchange, L. M. Davis and H. S. Baird of the university farm, Davis. The results were as follows:

P. Bernasconi, Harmony Valley Creamery, Harmony, 91½.

B. Berthelsen, Los Angeles Creamery Co., Hanford, 92.

John Clausen, Riverdale Co-op. Creamery, Riverdale, 91½.

Glenn Decow, Mission Creamery, Peiris, 91½.

A. L. Doty, Alturas Creamery, Alturas, 91½.

W. P. Everts, Exeter Creamery, Exeter, 91½.

W. J. Grinsell, Libby, McNeill & Libby, Loleta, 91½.

Ed Hooper, Spreckels Market Creamery, San Francisco, 93½.

L. Klokler, University Farm Creamery, Davis, 92.

Simon Koppes, Montague Creamery, Montague, 93.

L. Larsen, Sunset Creamery, Loleta, 94½.

Bert Myers, Los Angeles Creamery Co., San Luis Obispo, 91½.

Wm. Oekers, Sierra Valley Creamery, Loyalton, 91.

E. O'Mara, Heber Co-op. Creamery, Heber, 92.

Peter Petersen, Valley Flower Co-op. Creamery, Ferndale, 92½.

J. C. Phillips, Delta Creamery, Imperial, 92.

G. G. Plunkett, Tulare Co-op. Creamery, Tulare, 92½.

J. W. Smith, Santa Rosa Creamery, Santa Rosa, 93½.

J. W. Thorp, Morsdale Farm Creamery, Stockton, 90.

The average score of the entire lot was held down by the large number of entries which were of only ordinary quality. Mechanical defects of some sort found in practically every cube reduced the average score by one full point, but regardless of this the average score was lower than it should be when it is considered that the butter sent is representative of what practically every creamery is sending to its market. Various conditions are responsible for the slump in quality at this time of the year. In many of the creameries the make is now at its lowest point, some of the above entries coming from plants where the churning is not done every day. These creameries are as a rule equipped to take good care of the cream, but when it becomes necessary to hold

cream several days there is a decided handicap. This is true the more when it is realized that the dairymen are producing less cream now and that frequently the cream is held longer on the dairy. Almost without exception the criticisms made on the flavor of the butter point to improper care of handling of the cream, or too long holding. What are California creamerymen and dairymen going to do about this poor butter problem? No one seems to see a solution, though many realize the seriousness of the situation. If the systematic campaign which has been proposed and which is being studied out, can be started, it behooves every one whose interest centers in the butter business to lend his individual support. The one thing which is certain is that cooperation on this matter will accomplish more than many different lines of individual effort.

Summary for 1915

During the year a total of 51 different buttermakers took some part in the scoring contest. Twenty-five different counties were represented and entries were received at several of the scorings from creameries in Nevada. Under the 1915 plan certificates were to be issued for the following averages: Grade A certificate—average score of 92 or above on six entries. Grade B certificate—average score of 93 or above on five entries. Grade C certificate—average score of 90 to 92 on six entries.

Buttermakers who secured certificates were: Grade A—L. Larsen, Loleta, California, average score 93.5. Grade A—W. J. Grinsell, Loleta, California, average score 93.16. Grade A—B. Berthelsen, Hanford, California, average score 92.41. Grade A—G. G. Plunkett, Tulare, California, average score 92.25. Grade A—Ed Hooper, San Francisco, California, average score 92.08. Grade A—Simon Koppes, Montague, California, average score 92. Grade B—J. C. Phillips, Imperial, California, average score 91.58. Grade C—Glenn Decow, Peiris, California, average score 91.5. Grade C—P. Bernasconi, Harmony, California, average score 90.

MEASURING HAY IN STACK

For obtaining the number of tons of hay in a stack, the first step is to measure the width and length with a tape line, and then what is known as the overthrow, that is, pass a tape line from the bottom of the stack on one side over to the bottom on the other side, and divide this measurement which is called the overthrow by three, then multiply the length by the width, and this by one-third of the overthrow—this gives you the number of cubic feet in the stack. Of course, if the stack is different widths or different heights you will have to take the measurements in several places and obtain the average of these by adding them together and dividing by the number of measurements made.

The number of cubic feet of hay per ton varies considerably with the length of time that it has been stacked. With newly stacked hay it will take about 500 cubic feet to equal a ton. If it has been stacked for two to three months, from 350 to 400 cubic feet will equal a ton. After you have obtained the number of cubic feet in the stack, divide by the number of cubic feet in a ton, taking into consideration the length of time that the hay has been stacked.—I. H. C. Service.

HARD TOO

Thaddeus Stevens and all members of the house tell one anecdote of an occurrence in which Mr. Stevens and the Speaker of the House got into a sharp tangle, ending in Stevens savagely rolling up some documents on which he had been addressing the chair, and turning his back to the Speaker in the most impolite way while passing furiously up the aisle toward the cloak room.

"Is the gentleman trying to show his contempt for the Speaker?" shouted that dignitary.

"No," thundered back Stevens, turning around and facing the wielder of the gavel; "I am trying to conceal it!"—Life.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Founder

Horse six years old is in splendid condition but gets a stiffness in the cords of both front and hind legs, just cripples around and the frogs in his front feet seem to be rotten. The blacksmith has tried shoeing him different ways with no satisfactory results. I paid a big price for this horse less than a year ago. He has always had this trouble I found out later.—Subscriber.

Sounds like chronic laminitis (founder). The trouble is all in the feet and probably most of it in the front feet. Blistering just above the hoofs and soaking the feet in cold water or removing the shoes and allowing him to run in a wet pasture will give temporary relief but a permanent cure is not known for such cases. By leaving him barefooted and only working him on the farm he may get along well, but such horses can not stand road work.

Tuberculin Test

How is the tuberculin test applied to cows and is it considered perfectly satisfactory?—Subscriber, Pomona.

To test an animal for tuberculosis one should inject two cubic centimeters of tuberculin under the skin with an hypodermic syringe, preferably about the shoulder. Then by taking the temperature every three hours for 48 hours you can decide whether tuberculosis is present or not. If the temperature is not affected by the treatment then you may feel safe that the animal is not affected, but if the temperature rises three degrees or more during the two days after the injection the probabilities are that the animal is affected with tuberculosis.

A more recent method of applying the test is by injecting a few drops of the tuberculin fluid into the skin near the root of the tail. If the animal is affected with tuberculosis a very marked swelling will appear in the parts about the place the fluid was injected, but if no swelling follows then one may feel safe that the animal is free from the disease. The latter method does not require the use of the thermometer.

The test for tuberculosis should only be applied by one familiar with medicine and surgery and should be done antiseptically; otherwise more harm than good may be done. You ask if the test is considered perfectly satisfactory: No, not in all cases, but when applied by one who understands it it usually proves right and satisfactory. Those things are so often tried by those who do not know how to use a hypodermic syringe or thermometer and their failures have given the test a bad name.

PETER, THE YOUNGER

Boatman—"Peter an' me'll not be able to take ye out fishin' tonight, Ma'am; but Peter's nephew will be a fatter taken' ye av ye like!"

Lady—"Well, I hope Peter's nephew is cleaner than Peter is."

Boatman—"He is! Ma'am," he's younger."—Punch.

First Semi-Annual Sale

of

Kings County Poland China Breeders Association

will be held at

The Fair Grounds, Hanford, Calif.

Saturday, Feb. 5th, 1916

On this date there will be one hundred and fifty head of Registered Poland Chinas sold, consisting of

Bred Sows, Bred and Open Gilt
and a number of
High Class Boars

Some of the best animals from the leading herds of Kings County will be sold without regard to price or value. This sale will be absolute AND WITHOUT RESERVE. No protection measures of any kind will be permitted. Sale under cover and will be held rain or shine.

Poultry for Profit

THE IDEAL HEN

By T. J. Patterson, Missouri Poultry Experiment Station, Mountain Grove

IN order to succeed in breeding any animal it is necessary for the breeder to have an ideal and his efforts must be for the production of that ideal. Different breeders have different ideals. One man strives to produce the high scoring prize winning hen, paying little or no attention to egg production, while another tries to produce the high laying hen and ignores fancy or show qualities. All will agree however that the highest ideal is the hen which scores high, lays a great many eggs, and lives a long time.

Of the many lessons learned in the egg laying contests one which stands out most prominently is that color has nothing to do with egg production and that high scoring birds are often high producers.

In order to get an idea of the standing in the show room of the exhibitors who have had high producing hens in the contest at Mountain Grove, a letter was sent to each contestant who has had hens in the contests which produced 200 eggs or over.

Sixty contestants were heard from, giving the prize winning records while their hens were making the high record at Mountain Grove. One thousand eight hundred twenty-three prizes were won by these contestants which were as follows: 653 firsts, 477 seconds, 243 thirds, 198 fourths, 92 fifths, 142 specials, 18 sweepstakes.

Eight contestants had not entered any shows, therefore had won no prizes.

Many of the hens which won in the egg laying contest won prizes before and after the contest. These prizes were won in San Francisco, New York and Chicago shows, ten state shows, eighteen state fairs and many district, county and local poultry shows. This would indicate that many breeders are reaching the high ideal.

These records together with observations made during the contests indicate that color of bird, color of eye, kind of comb, etc., have nothing whatever to do with egg production, and that the fine show bird which scores high is just as sure to be a good egg producer as the low scoring bird, and as the bird which scores high usually carries herself as if she thought "life is worth living". She has high vitality which indicates long life.

Summarizing the fancy and utility question, we find some contestants who win in egg production, but not in the show room. Others win in the show room, but not in egg production, while others win in both shows and egg production. This leads us to believe that it is possible to go to either extreme by breeding or to combine the two.

The man who has never had his birds in a show has no right to claim they are high scoring birds, and the man who has never tested his birds for egg production should not boast of high producers, but the man who can win in both deserves the highest honors.

NATIONAL EGG LAYING CONTEST

Mr. C. T. Patterson, in charge of the fifth annual National Egg Laying Contest conducted by the Missouri state experiment station at Mountain Grove, writes:

The fifth National Egg Laying Contest is starting off nicely. Fifty-one and two-fifths per cent of the birds score above 90, this being the score required by the American Poultry Association to win a first prize. Therefore 51 2-5 per cent of the 530 are eligible to win first prize by the American Standard of Perfection.

SOME ESSENTIALS OF STARTING A POULTRY FARM

By James Hadlington in Agricultural Gazette of New South Wales

Many people with a small amount of capital, who are anxious to get on the land, are turning their attention to poultry keeping as an available means to that end. A small area of land, a little capital—with a good stock of common sense and plenty of grit—are the first essentials. Next to these is a definite system and plan of operation based upon methods that have been found successful. In other words beginners are advised rather to follow proven practical methods than to go in for experimenting and what generally comes under the category of "ideas of their own." By all means let us have progressive methods, for which there is plenty of room, but these ideas of one's own, not based upon experience, are often fatal to success. Ideas conceived in faddism, pursued in blissful ignorance, generally end in dismal failure. Such, then, should act as a warning to the inexperienced when starting poultry farming with the idea of making a living. **One Way to Start**

Undoubtedly the best way to commence poultry farming, when experience has to be gained, is to start at the bottom—that is to say, start with a few breeding pens of well bred stock and give the first year to hatching a stock of breeders for the following season. In this way much experience will have been gained before spreading out into larger numbers, and no net profits should be expected while breeding up. Profits on the running can only be calculated upon a stock taking basis, and this should form one of the first entries in the farm books. The stock purchased and the buildings and equipment installed should be all set out in books kept for the purpose, the one under the heading of "stock", and the other as "plant". Stock taking at a given date should be a feature each year, and all new plant should be set down at cost price, and each succeeding year a percentage of depreciation struck off according to the estimated life of the construction. The stock should be set out at sound commercial values, and then by keeping strict account of income and expenditure the accumulated values or profits, as the case may be, can be determined.

HOW TO CATCH A HEN

The problem of how to catch a hen has at last been solved by the University of California. "It is as a rule very difficult," writes Professor Dougherty and his collaborator, W. E. Lloyd, "to get close enough to a fowl, especially one of the more active and nervous breeds, to pick her up with one's hands. It generally happens that when one really wants to catch a certain fowl she simply won't let one get within arm's length. With the catching hook one can slip up close enough with much less wear and tear on both attendant and fowl." He declares that where used with normal care not to close the hook too tightly nor to jerk the fowl too suddenly, such a catching hook is almost indispensable in a poultry yard and particularly valuable for removing promptly from a pen any sick fowl which might soon spread disease through the flock.

"Animal food, ground food and a generous supply of green stuff produces the best results for laying fowls," says J. G. Halpin, head of the poultry department of the University of Wisconsin.

An experienced poultryman says that when his hens and chickens have had access to charcoal he has never had a case of bowel trouble in his flock.

Mr. Hatchery Man!

FARM LANDS FOR SALE

Farm Lands—20 Years to Pay. Fertile farms in Western Canada offered by Canadian Pacific Railway Company. Productive soil; good climate; ready markets; fine churches and schools; unexcelled transportation; all conveniences and opportunities of best farming districts anywhere. Prices \$11 to \$30 an acre; irrigated land from \$35. Loan of \$2000 to assist practical farmers in irrigated districts. Twenty years to pay—or sooner at your option. Long before your final payment is due your farm will have paid for itself. Also some improved farms with houses, barns, wells, fencing, and crops now growing on them on the same favorable terms. Interest in all cases only 6%. This offer is based on good land; we offer these terms because we know a farmer on our land can "be successful"; he can live well and save enough to pay for his farm. Western Canada lands are naturally suited to growing grains, fodders, vegetables, dairying and raising horses, cattle, sheep, swine, poultry. Cash in on the high grain prices. Don't delay; the best lands will be taken first. Write today for free handbook and full information to J. S. Dennis, Assistant to the President, Department of Natural Resources, CANADIAN PACIFIC RAILWAY, Calgary, Alberta, Canada.

Carlsbad Irrigated Farm Land—Bordering ocean; on state paved highway and Santa Fe Ry.; 80 miles south of Los Angeles; government records show Carlsbad warmest in winter, coolest in summer of any spot in Cal.; deep sandy loam model water system; low rates; lemons mature in summer when price is highest; immense profits in fruits and berries adaptable to coast territory; winter vegetables without competition; minimum temperature 1914 was 41 degrees; tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre; easy purchase terms. South Coast Land Co., G. Buxton, Sales Agt., Carlsbad, Cal.

FARMERS WANTED

VICTORIA, AUSTRALIA, offers special inducements. Government land, water, railways, free schools, 3 1/2 years to pay for farms adapted to alfalfa, corn, sugar beets, fruit, etc. Climate like California. Ample markets. Reduced passages for approved settlers. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

Adjoining the town of Concord and our farm are small tracts, just the thing for poultry, fruit and berries, which can be sold on rental terms, and we will assist buyers in many ways to get started in the poultry business. VALLEY POULTRY FARMS, Box 188, CONCORD, CAL.

Ten Acres Navelis, 15 years old, 108 trees per acre. Water interest in well, cost about \$9 per acre. Concrete pipe line with standards. Early fruit. No smudging. Trees in good condition. Price \$6500. No trade. Address P. O. Box 806, Los Angeles, Cal.

For Sale—Twenty-acre ranch. Flowing water worth price asked. Five-room modern bungalow; forty by sixty hay barn; stock barn. Fifteen minutes' walk to schools, depot, post office. Address S. S. Lee, Lancaster, Cal.

San Joaquin County Land For Sale—40 acres deep silt loam; best walnut, fruit and vegetable land in the county; \$200 per acre; terms; close to railroad. B. F. Goode, San Joaquin Valley Bank Bldg., Stockton, Cal.

A JELLY FACE

"When mama asked if I'd been stealing jelly, I said yes." "Why didn't you deny it?" I didn't have the face to say no."—Boston Transcript.

The Household Department

THE MAN BEHIND THE PLOW

They sing about the glories of the man behind the gun,
And the books are full of stories of the wonders he has done;
There's something sort o' thrillin' in the flag that's wavin' high,
And it makes you want to holler when the boys go marchin' by;
But when the shoutin's over and the fightin's done, somehow
We find we're still dependin' on the man behind the plow.

In all the pomp and splendor of an army on parade,
And through the awful darkness that the smoke of battle's made;
In the halls where jewels glitter and shouting men debate;
In places where the rulers deal out their honors great,
There is not a single person who'd be doin' business now,
Or have medals, if it wasn't for the man behind the plow.

We're buildin' mighty cities and we're gainin' lofty heights;
We're winnin' lots of glory and we're settin' things to rights;
We're a-showin' all creation how the world's affairs should run;
Future men'll gaze in wonder at the things that we have done,
And they'll overlook the feller, just the same as they do now,
Who's the whole concern's foundation—that's the man behind the plow.

—S. E. Kiser.

THE MEAN MAN

ALEB Peaslee and Lysander Hyne sat comfortably upon the fence of Mr. Peaslee's "upper paster," absorbing the warm June sunshine. In the road below them a peddler's cart, drawn by an emaciated horse, creaked along. Caleb Peaslee regarded the horse pityingly.

"I don't believe," he observed slowly, "that I've seen a hoss run down quite as bad as that one since the time Needham Bonsey sold a hoss to Wilder Blake for two dollars. You never knew Needham Bonsey, Lysander—he died 'fore you ever moved here.

"There's varyin' degrees of snugness," said Mr. Peaslee, reflectively. "There's prudence and snug and stingy and downright p'sen mean. Bonsey was p'sen mean. When I tell you he never weighed within thutty pounds of what he ought to weigh, 'count of scantin' himself of victuals, you'll know that what critters he had in his barn didn't get fed very heavy. In time everything Bonsey owned in the way of animals got so thin you c'd scarcely see 'em edgeways.

"Bonsey had a hoss that he used to tote his truck to Bangor with—a pretty good hoss it was, too, in the beginnin'; but workin' all the time and eatin' 'bout the same as never, soon got him where he wa'n't much more'n jest the runnin' gear of a hoss.

"Bonsey was comin' back from Bangor one day, and had got jest about abreast of Wilder Blake's place, when all at once the hoss begun to weave from one side of the road to the other, 'sif he was dizzy, and down he went in Wilder's dooryard, flat on his side, with his eyes shut, and 'parently with no more life in him than there would be in a hemlock log!

"I was workin' for Wilder at the time, and we both come runnin' down where the hoss was; when we saw his eyes shut and how thin he was, we both made up our minds he was dead.

"There!" Bonsey whimpered. "There's two dollars gone! A man offered me two dollars for that hoss's hide today, and he tol' me the critter wouldn't live to git me home, but I didn't believe him. And now he's up and died on me, and it'll cost me more

two dollars to move him off out of here, and I shan't come out a cent ahead."

"While he was talkin', Wilder looked at Bonsey same's you would at a toad; fin'ly he up and spoke.

"Rather'n have a good, honest hoss, even if he is dead, b'long to you a minute longer," he says, "I'll give you the two dollars and take care of him. That hoss has earnt a decent burial, with his skin on him, and I'm goin' to see that he gets it. Now you get off'n my premises till I get kind of cooled off toward you, or I won't undertake to say what may happen."

"Bonsey grabbed the two dollars and started off up the road.

"Well," Wilder says, after Bonsey left, "I guess mebbe the hoss's as well off there as anywhere till after supper, and then you'n I'll make some d'sposal of him." So we left him layin' there in the shafts, with the harness on him, and went into the house.

"When we got through supper I started out a mite ahead of Wilder. When I got round the corner of the house, where I c'd see down into the front yard, I let out a hoot that fetched Wilder runnin'.

"Whether it was that the hoss'd got rested, or whether it was the smell of that sweet grass there in the yard that fetched him to, I don't know and never shall, but there he was on his feet and feedin'. After Wilder nau looked at him a minute, he broke out gigglin'.

"Jest for the notion of it, Caleb," said he, 's'posin' we don't tell Bonsey that he's sold me a live hoss for two dollars, 'stead of a dead one—jest let him think we hauled the hoss away 'fore he come back after his wagon. I got a kind of idea that I'd like to put that hoss down in my lower paster, where thee won't anybody see him; and mebbe I'll feed him a little grain fom time to time, and see what he looks like in a couple of montns. What say?"

"We took and led the hoss into the barn, and the next day Wilder led him down to the back paster, which was all shut in by trees, and turned him loose.

"When I saw that hoss agin, 'bout three weeks later, I almost wouldn't have known him. His head was up and his eye was bright, and he was kitin' round that paster like a colt. I asked Wilder what he was callin' to do with him, but he jest shook his head and grinned a little.

"You wait and see," he says. "I got a plan, mebbe."

"Well, meantime Bonsey'd been huntin' for another hoss to take the place of the one that died, as he s'posed. But hosses was high and Bonsey hated to pay out money wuss'n cuttin' off a finger, so he hadn't traded for one, and was hirin' folks to haul his stuff into Bangor for him, and grumblin' 'bout payin' for it.

"After it had run on that way for 'bout three months, Wilder hitched up the hoss one evenin' and drove down to the post office, where he knew he'd find Bonsey. Mebbe there was a dozen of us settin' out there, and Bonsey was among 'em. I see him eyin' the hoss kind of disbelievin' when Wilder halted him, and he half riz up and then settled back again, 'sif he couldn't credit his eye.

"Quite a hoss you've got there, Wilder," says Ben Gullison. "Something you've traded for lately?"

"Well," says Wilder, "it's one I bought 'bout three months ago, and 'tween you and me, I think he's wuth all I give for him, anyway. Pretty good hoss for two dollars, I call him."

"Bonsey come up on his feet with a jerk, and he fairly hollered, 'Wilder Blake! Is that my hoss you're drivin'?"

"No, sir!" Wilder says. "That ain't your hoss—that's a hoss I bought of you for two dollars, before a wit-ness!"

"He didn't say any more jest then,

but sot there lookin' pretty straight at Bonsey. Bonsey turned red at fust, and then white, but he never said a word.

"After a bit, Wilder says, slow and thoughtful, 'sif he was weighin' every word, 'Needham Bonsey, I'm goin' to do somethin' that mebbe you won't understand. I paid you two dollars for this hoss, and I've give him the run of my lower paster ever since, and fed him 'bout ten dollars' wuth of grain, and now I've got a hoss there that's wuth a hundred and twenty-five dollars of any man's money, and he stan's me, at the outside, not over twenty dollars. Now,' says he, 'I'll tell you what I'll do.

"I'll sell you that hoss," he says, 'for seventy-five dollars, and that's fifty dollars less'n you can buy one anywhere near as good. But you've got to sign an agreement to bring this hoss to me once a month—I'm a public weigher—and put him on my scales. If you ever bring him there and he weighs over fifty pounds less'n he does this minute, he ceases to be your property and becomes my hoss again, without my payin' you a single cent! There's the conditions. What've you got to say?"

"I s'pose some men would have had pride 'nough to refuse, but Bonsey was too fond of money for that. They made out the writings and he took the hoss and went away with it.

"And," concluded Mr. Peaslee, "you might not credit it, but from that time on I d'know's there was a better-kep hoss in this town than the one Needham Bonsey drove."—Youth's Companion.

ON THE TOILET TABLE

Written for California Cultivator
By M. A. H.

The dainty girl keeps all the articles on her toilet table shiningly clean and in perfect order, for no matter how expensive the articles may be they will not add to the appearance of the table unless they are kept bright and shining.

The backs of hair brushes should never be dampened and the best way to clean them is to wash the bristles in gasoline then moisten a little whitening with alcohol and clean the silver backs with this. The backs and handles of ebony brushes should be rubbed over with a very little boiled linseed oil after washing and then rubbed with a soft cloth until all of the oil is removed.

Brass ornaments can be kept shining by rubbing with a soft cloth dipped in ammonia, then rubbed over a piece of pumice soap and then over the brass and then with a piece of soft fannel.

Toilet powders and creams can easily be made at home. An excellent face cream is made by stirring a heaping teaspoon of boric acid powder in a teacup of melted mutton tallow and then stirring in a little spirits of camphor. This can be poured in a mould and every night this should be heated and a little of the cream rubbed well into the skin with the tips of the fingers. One of the best face powders is made from plain starch by pulverizing to the last degree of fineness and sifting through muslin, then adding an equal part of boric powder and a little perfume. This powder is especially good to use if there are pimples or any breaking out on the face. A little burnt alum added to this powder makes a fine powder to use for perspiration, but it is better to add more boric powder if it is to be used for this purpose, as it helps to remove the disagreeable odor. For perspiring feet use a little of the boric acid powder in the water each time the feet are bathed. Keep on your table a box of cornmeal and a cake of mutton tallow. Rub the hands with the cornmeal after washing and drying them, and when you notice that your hands are becoming sore, heat a little tallow and apply it while warm; then draw on a pair of old, loose kid gloves. The meal in the day time and the tallow at night will keep the hands soft and smooth and prevent chapping.

When blankets have become worn, their time of usefulness can be prolonged by washing them and placing between two layers of cretonne, thin quilting or tacking. The blanket thus becomes a pretty comfort and will well serve its purpose.

WHAT BECOMES OF THAT CENT?

Here is a puzzler presented by the Columbus Dispatch. See if you can work it out. If you can't watch for the solution on this page of next week's Cultivator.

A farmer comes to town with 30 apples, which he sells three for a cent, getting of course, ten cents for them.

Another farmer, also with 30 apples, sells them two for a cent, getting 15 cents for his. They get 25 cents in all.

The next time they come in, with 30 apples apiece, they meet at the edge of town and put their apples together, making 60 apples. One man having sold two for a cent, the other three for a cent, they decide to sell them for five for two cents.

They do so, and when they're through find out they have received but 24 cents.

The problem is, why did they not get as much for their apples selling them five for two cents as they did when they sold them separately? Or, what becomes of the cent?

TWO GOOD RECIPES

Written for California Cultivator

These two recipes were sent us by a subscriber whom we are sorry we cannot credit with them as we have not her name. We will appreciate it if she will send us her name after seeing these recipes printed.

"I am sending you these two recipes for you to use or not, as you wish or have space any time. The first is a recipe that has been used in our family for over 50 years and was always favored by the little folks. The 'Mock Whipped Cream' was asked for by a subscriber not long ago. It may have been this she wanted.

Fruit Bread

Three pounds dried prunes, one pound dried pears, half pound dried figs, one pound raisins, half pound citron, one pound currants, one pound nuts, half cup shortening, two yeast cakes, one teaspoon cinnamon.

Cook prunes and pears, drain off the juice, put through the chopper with the citron and figs, put back in kettle, add raisins, currants, nuts and cinnamon. Make a sponge as for bread; let it rise, mix dough with juice, add the warm fruit, salt and shortening and flour to make a stiff dough, let it rise, put in pans, let rise again and bake about one hour in a moderate oven. Do not let it chill.

Mock Whipped Cream

"Cream one banana, add teaspoon of vanilla, half cup confectioners' sugar and the stiffly beaten whites of two eggs."

FACTS VERSUS FANCIES

Richard Le Gallienne was sympathizing with a young writer whose book of poetry had been refused by twelve publishers.

"Real lovers of poetry," said Mr. Le Gallienne, "are unfortunately becoming rare. Too many people nowadays are like the judge.

"This judge was recommended by a poetic friend to read Shelley. The great man of the law said he supposed he ought to read a little poetry, and, having heard so much of Shelley, he would try him.

"And what do you think of it?" said his friend to the judge after he had waded through a few pages of 'Epipsy-chidien.' 'Isn't it beautiful?"

"Well, well—oh, yes. I daresay it is," said the judge. "But what I want to know is when are we going to get at the facts?"—Washington Star.

REVENGE

"Jones," said his employer, "I'll give that vacancy on the staff to your twin brother. Run and fetch him."

"Twin brother, sir!" echoed Jones, who is a "britherless bairn," and was therefore naturally astonished.

"Yes, your twin brother," replied his employer, with grim humor. "I saw him at the ball game yesterday afternoon while you were attending your grandmother's funeral. A sad young dog he must be, I'm afraid, to go to a ball game while his brother was attending his grandmother's funeral, eh? Nevertheless, he shall have the vacancy. Run home and fetch him, and mind you don't return without him."

HOW TO GET THIS \$2.25 ALUMINUM GRIDDLE AT A SAVING OF \$1.40

Get 50 cents worth of Karo from your grocer, and send the labels to us together with 85 cents and we'll send you this \$2.25 Solid Aluminum Griddle by prepaid parcel post.

HERE is a clean cash saving of \$1.40—and thousands of housewives have already taken advantage of this remarkable chance to get an aluminum griddle for less than the wholesale price. This Aluminum Griddle needs *no greasing*. It doesn't chip or rust. It heats *uniformly* over entire baking surface—doesn't burn the cakes in one spot and leave them underdone in another. It doesn't smoke up the kitchen—and the cakes are more *digestible* than when fried in grease.

At great expense we are seeking to place a Karo Aluminum Griddle in the homes of all Karo users, so that Karo—the famous spread for griddle cakes and waffles—may be served on the most deliciously baked cakes that can be made.

You know Karo, of course. Nearly everybody does—65,000,000 cans sold last year alone. And you doubtless know the wonderful cleanliness and durability of Aluminum ware.

If you are a Karo user already then you know all about this wonderful syrup—you know how fine it is as a spread for bread; how delicious it is with griddle cakes, waffles, hot biscuits and corn bread.

Get 50 cents worth of Karo from your grocer at once, and send the labels and 85 cents (P. O. money order or stamps) to us and get one of these Aluminum Griddles by prepaid parcel post.

Remember that our supply is going fast—so get your Karo today. We will also send you *free* one of the famous Corn Products Cook Books.

Citrus Fruit Market

LOS ANGELES, Dec. 29, 1915.
The best that can be said about the citrus market this week is that there is strong inquiry for California oranges. The prices are very satisfactory, the fruit is giving the best satisfaction ever, and the best condition that has ever obtained at this period of the year prevails.
Lemons likewise have no quarrel.

Shipments

Shipments of oranges to date from Southern California since November 1, 1915, 1012 cars, lemons 788, total 1800. To same date last season, oranges 880, lemons 452, total 1332. From Central California this season, oranges 3567, lemons 63, total 3630. Last year same date, oranges 4323, lemons 82, total 4405. From Northern California this season, oranges 531. Last year same date 431.

NEW YORK, Dec. 27. — Thirty-two cars California navel, one car Arizona navel, six cars California lemons sold. Navel about 25 cents lower. Lemons 25 to 50 cents lower. Arizonas lower. Weather partly cloudy.

PHILADELPHIA, Dec. 27. — Three cars sold. Market lower on oranges; strong on lemons.

NAVELS—
Lindsay, C. C. Ex.\$2.35
Banner, xf, Sutherland F. Co..... 2.50

PITTSBURGH, Dec. 27.—Eight cars sold. Market steady on oranges and lemons.

NAVELS—
Golden Star\$2.50

CLEVELAND, Dec. 27.—Eight cars sold. Market is unchanged.

NAVELS—
A One, American F. Dis.\$2.80
Paramount2.60
Diamond Mtn., Randolph F. Co..... 2.55

CINCINNATI, Dec. 27. — Four cars sold. Market is steady.

NAVELS—
Lindsay, C.C. Ex.\$2.35

BOSTON, Dec. 27.—Eighteen cars sold. Market is easier on both oranges and lemons.

NAVELS—
Paramount Blue\$2.55

ST. LOUIS, Dec. 27.—Seven cars sold. Market steady on navels; strong on lemons.

CHICAGO, Dec. 27.—California casabas are firmer and higher because of the holiday demand and limited supply. Flat cases, six to eight melons, \$2.50@3.00. Orange, boxes California navels, \$2.25@3.25; Florida, \$1.50@2.25; Satsumas, half boxes, \$1.60@1.75; tangerines, straps two, \$2.00@3.25. Pomegranates, half orange boxes, \$2.00. WM. P. STARK
America's
Nursery

This big new... just off the press... sending a... price list to our old customers and Cultivator readers, who are on our list, order to get this complete, illustrated 1916 Catalog, you must write for it today. It is mailed only on request.

Famous Delicious Apple
—Its luscious flavor, delightful juicy crispness and fragrant aroma sell the Delicious at an average of \$1.00 per box more than other apples. Delicious is especially adapted to Pacific Coast conditions and reaches highly colored perfection in Washington, Oregon and parts of California. Late bloomer; regular bearer; very productive. Now the best selling apple in the market.

Best Apples—Red Astrachan, Gravenstein, Paragon, Stayman Wine-sap, Winter Banana, Rome Beauty, Jonathan, Black Ben, Liveland Raspberry and others.

Anjou Pear—Best commercial pear. Other dependable varieties, Seckel, Bartlett, Lincoln, Comice, Clapp, Winter Nelis. Dwarf Pears—Can be planted closer, bear 2nd and 3rd year. Quinces—Fine for flavoring preserves and jellies.

Endicott Plum—Large, juicy, superb quality, hardy. Wonderful promising new plum, being planted by the thousand. America, Red June, Burbank, Abundance, Italian Prune, Shropshire Damson. Thrive in poultry yards, back lots, anywhere.

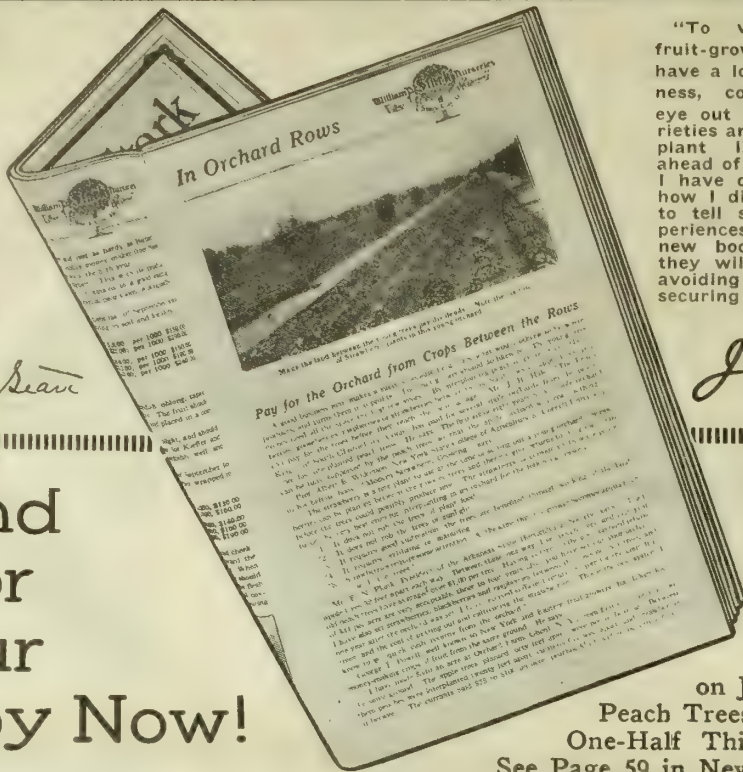

Apricots—Blenheim, Royal, Tilton and all good varieties. Well-balanced, heavy-rooted, strong trees.

Everbearing Strawberries—Bear first season, fruit all summer. Our everbearing strawberries paid for cost of all plants, cultivation and care first season set out, yielding \$5 and \$7 per crate. We picked ripe berries to November 14th at Stark City. Order plants now, as demand is tremendous.

Roses—Field-Grown; all best varieties, Teplitz, Snow Queen, Kaiserin, Caroline Testout, Dorothy Perkins, etc., for cut flowers, mass planting, climbers. **Shrubs**—Best and hardiest for all purposes. **Hardy Perennials**—Peonies, Phlox, Iris, etc. See list in catalog.

William P. Stark's New 1916 Fruit Book—FREE

This book has cost us thousands of dollars to produce. It is the most complete and up-to-date book of its kind ever published. Used as reference book by Universities in horticultural courses—endorsed by experts everywhere. Easily worth \$1.00 per copy, but MAILED FREE if you write today.

Just the Information You Want

- Gives complete description of fruit, shape, color, quality, etc.
- Tells when fruit ripens, season of use, etc.
- Describes growing habits, hardiness, where each variety succeeds best.
- Which are best money makers for your section.
- Gives weak points as well as good ones.
- Peach-ripening chart; gives dates of succession of ripening, earliest to latest.
- Illustrated with nearly 200 photographs of fruit, trees, orchard scenes, etc.
- Tells right distance to plant, number of trees or shrubs necessary per acre.
- 160 pages. Fully indexed, easy to find what you want. Handy pocket size.
- Prices in plain figures under each variety. Same low grower's prices to all.

Grow Better Fruit—Get Bigger Profits

Consumers today demand quality. They appreciate well-grown fruit, free from worms, scab or blemish—but to get

top-notch prices you have to furnish fruit better in taste and flavor, better in appearance and better in quality. Prof. F. C. Sears, author of "Productive Orcharding," says: "Given choice apples and a family will easily use ten barrels in a year; furnish them with Ben Davis and they can get along with one barrel and not feel the loss." The varieties we list in our catalog are the ones we have proved through actual orcharding experience to be the most readily salable, the most dependable and to bring the highest returns to the grower.

Thrifty, Hardy, Big-Rooted Trees

Vigor and healthiness are important things in buying trees. But more important yet are the roots, for the roots furnish the first food to the newly planted tree. Thin, spindling roots mean slow, weak growth. Plump, strong, heavy roots, grown the William P. Stark way, give the young trees a quick start, a healthy, thrifty growth and bring the trees into bearing very young—often a year sooner than ordinary grown trees. Our Ozark Mountain Stark City soil is famous for the roots it produces. Insist on good roots—they are the very foundation of your orchard.

Buy Direct From Nursery Save Money — Get Better Trees

We have no agents, canvassers or "plate-book men." Have the trees shipped direct to you without numerous re-handlings and exposure to rots., Our "3000 Mile Package" insures safe arrival anywhere in the world. Get trees doubly guaranteed true-to-name. Don't take chances. Look out for agents claiming to represent us. They are frauds. The only way to get genuine William P. Stark quality is to order direct from Stark City, Missouri. Send for the Free Book now.

"To win success in fruit-growing one must have a love for the business, coupled with an eye out for valuable varieties and the courage to plant liberally to be ahead of the other fellow. I have often been asked how I did it. I am glad to tell some of my experiences in Mr. Stark's new book in the hope they will help others in avoiding mistakes and securing larger profits."

J. H. HALE
"The Peach King"

Mr. Hale is recognized as the most progressive fruit-grower in America. It is a characteristic of him that "he never puts the weight of his name and reputation back of anything that he hasn't tried out to a solid conclusion." His word is accepted as authority by fruit-growers everywhere.

J. H. Hale—America's Greatest Market Peach—In the largest peach crop in history this year, the J. H. Hale brought premium prices, selling at \$2 to \$2.50 per bushel, as against 80c to \$1.25 for Elbertas. These sales were in carload lots. Outyields Elberta, doubles it in size, far better quality, better keeper and shipper, higher color—biggest money-maker in peaches. **Caution**—Our exclusive contract with Mr. Hale guarantees you genuine trees. Look for trademark signature on tag, registered in U. S. Patent Office.

Early Rose Peach—We are offering the Early Rose to fruit-growers for the first time this season. Highest quality and best shipping early variety. As wonderful for its season as the J. H. Hale is to mid-season peaches. Mr. Hale has over 200 acres in bearing—carload after carload sold in New York market at \$3.00 to \$3.50 per crate. Fully described in new catalog. Write for it.

Sweet Cherries—Bing, Royal Ann, Lambert, Black Tartarian, etc. Our one year cherry trees with two year roots are exceptionally heavy, well-developed—remarkable value for the money.
